COAL AGE

With Which is Consolidated
The Colliery Engineer

INDEX TO VOLUME XXIII

January 1 to June 30, 1923

Note.—Illustrated articles are denoted by an asterisk (*), book notice by a dagger (†). Titles are often abbreviated. They are indexed under their most important words, or, if no word be distinctive, under the first one (except "A," "The," etc.) or under some topical word not found in the title. (e) denotes editorials.

Following is a list of the pages included in the several numbers of the volume by date:

		Pages
Jan.	4	1- 42
"	11	43- 82
"	19	83- 168
"	26	169- 206
Feb.	1	207- 244
"	8	245- 282
"	15	283- 320
"	22	321- 358
March	1	359- 396
"	8	397- 434
"	15	435- 472
"	22	473- 510
"	29	511- 548
April	5	549- 586
"	12	587- 624
"	19	625- 662
"	26	663- 700
May	3	701- 740
"	10	741- 778
"	17	779- 842
"	24	843- 882
"	31	883- 920
June	7	921- 958
"	14	959- 996
"	21	997-1034
"	28	1035-1076

EXAMINATION QUESTIONS
—Alabama first-class—Duties of mine foremen; use of mine map; surveys of workings; precautions on finding explosive gas; procedure on finding firedamp; safety lamp apertures in lamp gauze 647
—Alabama foremen—Loading coal where roof is unsafe; splitting air current; reducing accidents from blasts and explosion of powder; increasing ventilation without increasing power; safety precautions; handling and storing explosives; quantity of air passing 723; Successful mine foreman qualifications; water gage; obstruction in airway; materials best for tamping shots; rubbing surface in airway; puncher machines; solid shooting; placing shots 763
—Alberta, Under Mines Act—Percentage gases in return air; causes accidents from blasting and prevention; coal dust; difference between force and exhaust fans 532. Relative importance of constituents; laws relating to friction of air in mines; diameter upcast shaft; speed of fan 571. Wolf and Edison safety lamps; shotfiring with high percentage of gas in air; placing shotholes 609. Procedure with safety lamp full of flame; duty of mine foreman on report danger in old workings; marsh gas; coal dust extend mine explosion in absence of explosive gas; rendering coal dust harmless; humidifying air in mines; humidity to render dusty and gaseous mine safe 685
—Indiana hoisting engineers—Level to carry water in boiler; effect of drum on life of hoisting rope; examining hoisting rope for safety; alternating current; scale in boilers; meaning of open, closed, grounded and short circuit; pumping 62
—Mine foremen, Lexington, Ky.—Cost per ton yard; weight of air; gallons of water in pipe; volume of air per men employed; drawing of room and entry

Page

EXAMINATION QUESTIONS—Continued
pillars; mine maps; coal dust precautions; hoisting safeguards 305. Black powder and permissible powder in solid shooting; precautions in entering old workings; release and revive man in contact with live wire; water gage reading; use of timbers *342
—Misc.—Barometric pressure; difference quantity of air through two splits; rendering coal dust safe from explosion and methods of applying moisture; duties of mine foreman; horsepower of engine and weight lifted; percentage of gas in air current 187
—Misc.—Difference in horsepower to produce given circulation in winter and summer; three essential elements in ventilation; rubbing surface in airway; necessity of regulator; attaching hoisting cable to cage; spring safety catches; quantity of air in Illinois mine; explosion of lamp while testing for firedamp 419
—Misc.—Effect of change in atmosphere at surface on mine generating explosives gases; restoring ventilation where doors and air stoppings are destroyed; mine fires; pressure on face of entry with shaft full of water; piston areas; size of piston rod; studs to hold cylinder cover in place; cylinder tank holding; size storage bin; rendering firedamp harmless 827
—Misc.—Lifting power of engine; water evaporation; area of safety valve; firing a boiler; non-explosive gases; velocity of air current; air splits per number of men 261. Correction..... 261
—Misc.—Pressure in airway; causes, precautions and method of combatting mine fires; rubbing surface of airway; water gage 381. Correction 685
—Misc.—Non-explosive gases in lignite mines; replacing timbers; breaking strain on cable; installing booster fan; testing for gas; revolutions per minute single-acting pump 20
—Misc.—Precautions in mines subject to sudden outbursts of gas and warnings preceding; gas given off in mine; weight of marsh gas; Burrell gas detector; explosion where there is no firedamp; velocity of air current.... 457
—Misc.—Ventilating fan; volume of air passing through airway; rope stresses; causes sudden outbursts of gas 495
—Springfield, Ill., mine managers—Precautions in blasting; dangers from coal dust; changes met in coal roof and bottom when approaching faults; horsepower on air; fan or furnace for shaft mine 500 ft. deep; precautions for good current of air; best results from fan capacity of which is limited 865. Ventilation; safe working load for mine prop; methane absorbed by air current; tons of coal hauled in 8 hr. by electric motor; preparations at gaseous mines for explosions; removal of gas from holes and cavities; ventilation in shallow and deep mines; high and low-water gage 905. Inclination of coal seam; proportion gas to air at maximum explosive point; limiting proportions that determine explosive mixture; marsh gas to render dangerous air current; variation of temperature of air; methods of working; distribution of air in two sections ventilated by separate air currents 943. Law regarding air currents and splits; rapid current of air in small airway; weight cubic foot of air; law concerning certificate as mine examiner; duties of mine examiner; removing firedamp from face of entry 981. Rubbing surfaces of airways; law on circulation of air; removal of blackdamp or firedamp; explosive gas precautions; symbols and their weights; preventing cap in safety lamp 1019
—Springfield, Ill., hoisting engineers—Laws regarding certificates; duties hoisting engineer; revolution per minute; horsepower of engine 1059
—West Va. mine foremen and firebosses—Haulage systems; velocity air current; conditions necessitating larger circulation of air; effects of windy or blown-out shots and precautions; conditions to secure good ventilation 227

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 23 NEW YORK, THURSDAY, JANUARY 4, 1923 Number 1

"How to Run Coal"

UNDER this alluring caption the Nationalization Research Committee of the United Mine Workers has issued a booklet of "Suggestions for a plan of public ownership, public control, and democratic management in the coal industry." The report is signed by John Brophy, William Mitch and C. J. Golden. It is not stated who composed the paper, but the inference is that some of the more liberal-minded "intellectuals" who inhabit the country's metropolis lent a helping hand.

This is stated to be a plan on which the mine workers can build sentiment for the nationalization of the coal industry. It is frankly stated that the "term nationalization and the term socialization meant the same thing." The booklet is intended for distribution among the mine workers of the country; it is calculated to arouse their interest in and desire for nationalization of the coal industry. The reader is told that "the prime cause of labor disputes is removed by nationalization in the elimination of the profit motive"; and it is announced that the miners' program is one with that of the railroad workers for the nationalization of the railroads of this country.

Now it will be remarked at once that Mr. Brophy is willing to go much further than Mr. Lewis. Last April, before the Committee on Labor of the House, Mr. Lewis said that the mine workers "believe in the nationalization of the coal mines, to be accomplished in a perfectly legal and proper way . . ." He supplemented this formal prepared statement, when asked by the chairman, Representative Nolan, what he meant by "nationalization," by saying: "That is a matter for determination. It is merely suggested as being a more feasible suggestion than any other. I think that government ownership is an impossibility under present circumstances. The people of the country are not in a position to acquire title to the mining deposits of the country or the developed mining properties. It would constitute a tremendous financial burden on the country." This burden is estimated in the committee report signed by Mr. Brophy as follows: "Four and a half billion dollars for the coal industry and the coal of the United States is a liberal estimate." The *New York Times* comments that this cost is the least of the objections to nationalization.

In other words, "nationalization" of the coal industry is yet a nebulous idea with the United Mine Workers; it is something some of them at least, spurred on by free-thinking "parlor socialists," believe leads them to their Utopia. What do they say will be gained if the government buys from the owners all the coal mines and all the coal lands and lets the workers and others run them? The answer is found perhaps in a list of questions addressed to the mine worker found at the end of the pamphlet. "How much control do you want over your job?"; "Without nationalization, how do you propose to cure slack work?" are some of them. The inference, of course, is that if the properties are taken away from the capitalists who own them, the workers can have full control and can eliminate slack work time.

It is not true that the operators have made no proposal to correct the ills of the coal industry. They have said that if the union will agree to, or be made to acquiesce in, arbitration, national strikes will be thus prevented, the excess development that hangs over the industry will in time be absorbed or eliminated and the industry be permitted to function normally. Neither is it true that this proposal of the miners is thought out and through. In fact they have reasoned backward, saying that nationalization is the panacea for all the troubles of the miner and that it will cure high prices and insure regularity of supply to the consumer, and then they have started to define nationalization and to work out a plan to do those things. They are aping the British miners. They are groping for the pot of gold at the end of the rainbow, the aggregate profits of the industry. The very thinking, the talking and the groping of these men, be they parts of the United Mine Workers or others who are interested theorists, are a part of the milling around of labor the world over, seeking the millennium, trying to solve in their way the great problem of industrial relations.

There is not the slightest possibility that the country will adopt nationalization of the coal industry with any great rush. For those who fear it it is nothing to be afraid of—yet. The answers to most of the arguments and statements in the "How to Run Coal" booklet are obvious, if the reader will think straight. The trouble is that most of those in whose hands the pamphlet will be placed are not trained in straight thinking and are therefore the more likely to be misled. The subject is worthy of the best and most serious thinking of the coal industry. "How to Run Coal" deserves study; it is not lightly to be cast aside.

Mr. Spens Retires

LOOKING back to the activity that preceded and accompanied the passage by the Congress of the act creating the Federal Fuel Distributer, from which position Conrad E. Spens has just retired, and casting up the fruits of his administration of that act leads to the observation that dire predictions oft come to naught and that there is a world of common sense yet to be tapped.

With no real authority, confronted by skepticism from the operators and wholesalers and having but a "we wish you well" from the consumers, Mr. Spens left his work as vice president in charge of traffic of the Burlington railroad and tackled the job of distributing the coal of the country at a fair price. He exceeded all expectations. His tact, his knowledge of human nature and, yes, of politics, and his wholesome

personality put the job over. Those who when he started were the first and the loudest in saying that whatever he did would be unconstitutional and should and would be attacked are now praising him.

It is taking nothing from his glory to say that the strategy controlling his methods was laid down in advance by Mr. Hoover. Mr. Spens carried out the plans; he lined up producer, jobber, railroad and consumer. He obtained that measure of co-operation needed to make the coal industry function in a logical, reasonable manner at a time when all was set for a panic and another price scandal. There has been no more felicitous "control" of the coal industry than that of Conrad E. Spens.

Name Them!

GLIBLY do the newspapers and the men on the street talk about "coal barons." There is but one answer to their aspersion and this is simply: "Please name them." The request never fails to have the desired effect; they are never named. If you talk of lumber barons, the name of Weyerhaeuser, one of the richest men in America, comes readily to the tongue. If the talk drifts to steel barons, up come such names as Carnegie, Schwab, Frick, Hanna and Corey. Of railroad barons none is now left, but nevertheless the names of Harriman, Hill, Huntington, Vanderbilt, Gould and Crocker are not forgotten. Of automobile barons there are Ford, Couzens, Dodge and Willys and many others. The Rockefellers and Doheny head a long list of oil barons. Notable shoe barons are Endicott Johnson and Douglas. Try out the list for banker, dry goods, packing, sugar, copper, journalist, magazine and other barons and you will find that your memory in no way is remiss. But for coal barons you must search the directory, and most of those that will be named will not be barons in their own right but by virtue of the aggregations of other people's capital which they are investing and managing. There are no real coal barons.

But surely coal is a source of much profit. Anyone around the bituminous coal regions can tell you of men, little removed from penury, who in a few months have become among the more wealthy of the people in the small communities in which they live. And with this reflection it must then be borne home forcibly on those who really think the subject through that in the coal industry it is not true that the "first million dollars are the hardest." Exceptions perhaps are those who make profit on royalties and the buying and selling of coal lands, and even they do not become really wealthy as measurements of wealth are made in other industries. In the actual operation of coal mines the start is far easier than the finish.

The small operator who opens his property just when coal becomes scarce is the man who makes the profits. His investment is small, his coal is near at hand and spot prices are high. He is likely to become rapidly well-to-do.

His big neighbor finds himself loaded down with contracts taken at a low figure. He has estimated his power to fill orders on the basis not of his probable car supply but of his mine capacity. When coal becomes scarce his rivals multiply and they share his cars. He might get enough to have a little coal to sell on the spot market if cars came as regularly as they did when orders were few, but they do not. Meantime his customers are coming forward for the maximum tonnage contemplated in their contracts.

He finds his men ready to strike, unwilling to work steadily, and still more ready to drift away from him. His smaller rivals will pay any wages. They are in business only for the nonce. They do not fear the after-effects of excessive liberality and they have no contracts. They can pay any wage necessary, for the spot price warrants it. Without enough men, with insufficient cars, loaded to the guards with low-priced contracts, he passes through the time of plethora without any great profit and as he has a large investment, a heavy debt, much expense for upkeep and taxes on a large land-acreage, he must continue to work his mine in the gray, uncertain light of the morning after. Truly the second million dollars come the hardest.

But wait! We do recall a coal baron, the late Francis S. Peabody, of Illinois. While he lived he was always a capitalist and not a mere servant of some large corporation. When he died he was found to be worth $2,500,000. Everybody must have been surprised that this man, the leading figure among Middle Western coal owners, was worth so little. Men who have cut a much narrower swath than he have been worth many times as much. Yet as a coal baron, in point of wealth, he took a high place.

Let us compare his wealth with that of the Ford Motor Co. This giant aggregation started from nothing in 1903. To that, little but profits were added, and see what the record shows. The capitalization soon rose to $2,000,000. In September, 1910, Ford declared a dividend of 100 per cent cash; in June, 1913, of 500 per cent cash, and in 1914 of 100 per cent. In 1915 the dividend paid was not reported, but in 1916 it was 60 per cent and in 1919 the dividend was 200 per cent. In that same year as a result of the suit of the Dodge Bros. against the Ford Motor Co. that corporation had to pay out a further dividend of $19,276,385.

With all these dividends the Ford Motor Co.'s total assets at last reports were $409,820,152; its surplus was $289,935,296; its cash and debts receivable totaled $148,615,334.

On one act of candor the public may be congratulated —and it is a fact that shows that the people know the truth but have not as yet grouped what is known in detail into a broad generalization—and that is that you almost never hear of "coal kings." There are oil kings, steel kings, sugar kings and kings of finance but a barony is the highest title which a coal man ever receives from the grateful (?) public. The people with all their irritation know well that no coal man ever arrives at great wealth. If the press knew of a coal king it would not overlook him. The only person who ever got that title in the American press was a Welshman, Baron Rhondda, and whether he was really entitled to the distinction is a question.

CONSIDERATION OF THE AMENDMENTS to the Coal Commission Act by the Interstate and Foreign Commerce Committee of the House of Representatives was scheduled to begin during the week of Jan. 1. No opposition to the amendments is expected and prompt enactment is predicted.

AS THE RANKING MEMBER of the Interstate Commerce Commission, B. H. Meyer will act as chairman of the Commission during 1923. The chairmanship rotates among the members from year to year in order of seniority of service.

Remodeled Valley No. 2 Operation of the Nineveh Coal Co.

By Charles N. Martin*
Seward, Pa.

Double Rooms Reduce Labor of Coal Loading—Solid-End Cars Used with Self-Dumping Cages Having Revolving Cradle—Improved Hoisting Cycle Saves Time and Lowers Power Consumption

DEVELOPED to serve a 40,000-kw. plant of the Penn Public Service Corporation on the bank of the Conemaugh River just on the outskirts of Seward Borough, Westmoreland County, Pennsylvania, the remodeled mine of the Nineveh Coal Co. exhibits well what can be done to adjust an old and inefficient mine to present-day needs. The power plant, which serves this field and the mining districts of adjoining counties, has been in operation about one year.

The mine is located on the main line of the Pennsylvania R.R. not far from the common meeting point of Indiana, Westmoreland and Cambria counties, in a large coal field which is practically undeveloped.

The seam of coal being worked by the Nineveh Coal Co. is the "B," or "Miller," bed, which in this field has an average thickness of 44 in. The bed is opened by a shaft at a point where the coal is 135 ft. below the surface. The former system of working the mine was by single-neck rooms each having a pillar which was drawn from one road only. This was not producing results in proportion to the energy that the miners expended. The management of the Nineveh Coal Co. conceived the idea that two-neck rooms with each pillar drawn from two roads would be more efficient and would prove more economical in the cutting and loading of the coal. The increased output per miner that resulted and the greater satisfaction of the miners, which is the outcome of the better earnings arising therefrom, have proved the wisdom of making this change in method.

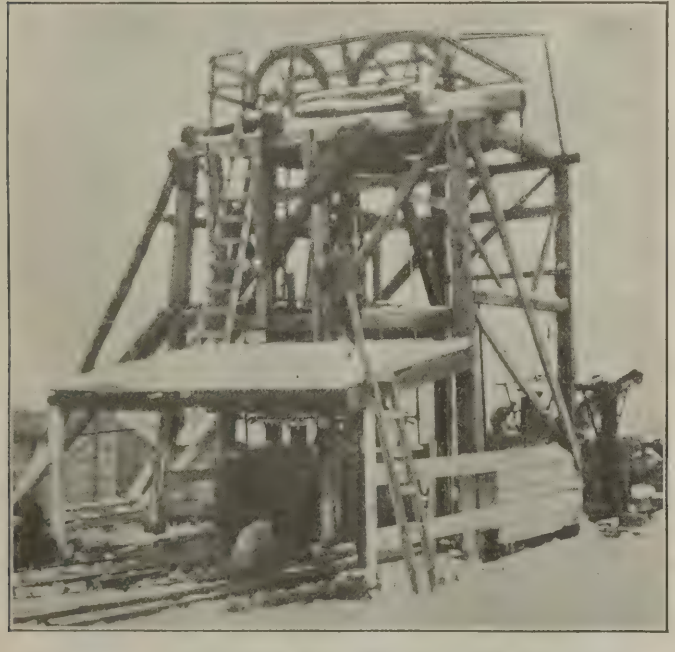

FIG. 1—OLD NINEVEH HEADFRAME NOW REPLACED

The Nineveh coal field, like many another below water level in central Pennsylvania, was long overlooked and in this case the pioneering efforts were not on any elaborate scale but they served to exhibit the value of the area they uncovered.

*Superintendent, Valley No. 2 Mine.

The coal is undercut by shortwall mining machines with 6-ft. cutter bars, the coal being blasted by permissible explosives fired by electric detonators. Thus breakage is reduced to a minimum and the miners are afforded maximum safety. All main roads are equipped with 40-lb. rails and the coal is hauled over them by electric locomotives.

Cars Are Wide and Low, Having Solid Ends

Composite steel-and-wood solid-end cars are used instead of the old-style equipment. The maximum height of these cars above the rail is 28 in. They have a capacity of 1½ tons. Cars of this type are well fitted to the requirements of this seam as with them and with steel ties in the rooms it is unnecessary to lift bottom in the working places. The miner has about 12 in. of height above the car in which to load his coal. This could not be obtained without some such arrangement.

The rooms are driven sufficiently off the strike and up the pitch to make the gradient 1 per cent in favor of the load, thus rendering it easy to move the cars into and out of the rooms. The maximum grades on entries are about 5 per cent in favor of the loads, a grade on which large trips readily can be transported. These grades also afford good drainage gradients to one central point where three horizontal-split double-suction single-stage centrifugal pumps have been installed, each having a capacity of 750 gallons per minute.

A new 8-ft. straight-flow fan has been installed on the old airshaft. It has a capacity of 50,000 cu.ft. of

air per minute at 1¼-in. water gage and a speed of 250 r.p.m. It is driven by a 20-hp. motor. The airshaft has been retimbered and a new staircase installed by which the men can enter and leave the mine. The airshaft is located near the main hoisting shaft and runs vertically downward for 75 ft., but then slopes off for 130 ft. to the coal seam.

Solidcar self-dumping cages which hoist and dump solid-body cars have been installed in the main hoisting

FIG. 2—CAGE AND HEADFRAME

Note the hopper below the cage into which the car dumps as it approaches and reaches the upper landing. By the opening of the gate of the hopper the coal is discharged gently into the weigh basket in the tipple. This shows the cage at a point below the dumping position.

shaft by the Car-Dumper & Equipment Co., of Chicago, Ill. The many obvious advantages of the solid-body car have been well known to operators of shaft mines for some time, but until the development of the Solidcar self-dumping cage the only shaft mines that had been able to avail themselves of the advantages of this type of car were those which were large enough to use skip hoists with a rotary car dumper at the shaft bottom. The management of the Nineveh Coal Co. felt that with a solid-body car they would have a lower first cost, a stronger car, lower car maintenance and less road-cleaning expense.

The self-dumping cage overturns the car slowly and easily, the overturning commencing some distance below the final dumping point, and as a result the coal is discharged from the car with so short a fall and so light a shock that the coal in dumping, for all practical purposes, is not broken or degraded. As the car is rotated around its center of gravity little power is required for dumping, and as none of the weight of the empty car or cage is taken off the rope at the head of the shaft the peak load on the hoist is considerably reduced.

Entering the cage at the bottom of the shaft the car is engaged by keepers and rests on a cradle which is mounted inside a hopper, to which the bail and hoisting rope are attached and which has a hinged discharge gate at the lower end. This cradle is built in the form of a hoisting platform, making the cage suitable for hoisting cars, men or material.

The cradle is pivoted on heavy trunnion shafts which pass through the hopper at each side and which have the dumping arms and rollers fastened to their outside ends. This rotating cradle is pivoted at a point which is a little to one side of the center of gravity of the loaded car in the cradle, making it easy to overturn at the head of the shaft. During hoisting the cradle is locked in the horizontal position. The hinged chute at the bottom of the cage also is locked in the closed position by direct connection to the overturning arms.

As the cage approaches the dumping point the guides unlock both the gate and the cradle in which the car stands, and the rollers on the overturning arms under the main dumping guides turn the cradle over in an easy rotation until the car finally reaches the overturned position at the end of a 135-deg. rotation.

It is because the hopper is under the car to receive the coal that the dumping guide can be made so long and with such an easy curvature as to give an overturning movement that is gradual and smooth. This arrangement eliminates any excessive strain or jar in the dumping operation and spills the coal out of the car into the hopper slowly. Breakage is prevented by a dumping shield, so placed that the larger lumps of coal cannot fall into the hopper until a bed of slack has formed.

After the gate is unlocked by the overturning action of the cradle it is held closed by the action of the

FIG. 3—CHUTE FOR LOCAL COAL; CAGE ON RIGHT

A loaded car is ascending in the cage and thus far has not reached the point of overturning. The chute for local coal can be opened and shut from the ground.

dumping rails at the side of the shaft until it reaches the dumping point. The coal discharged into the hopper is held back by the gate until the dumping point is reached. Here mechanical devices allow the gate to open. At this instant the car has become divested of all its coal and the whole load in the hopper immediately flows across the open gate to the weigh hopper in one continuous sliding motion without any vertical fall whatever.

When the cage stands in the dumping position the entire weight of the cage and car is kept on the rope, giving a maximum counterbalance to assist in starting the next loaded cage from the bottom of the shaft. This

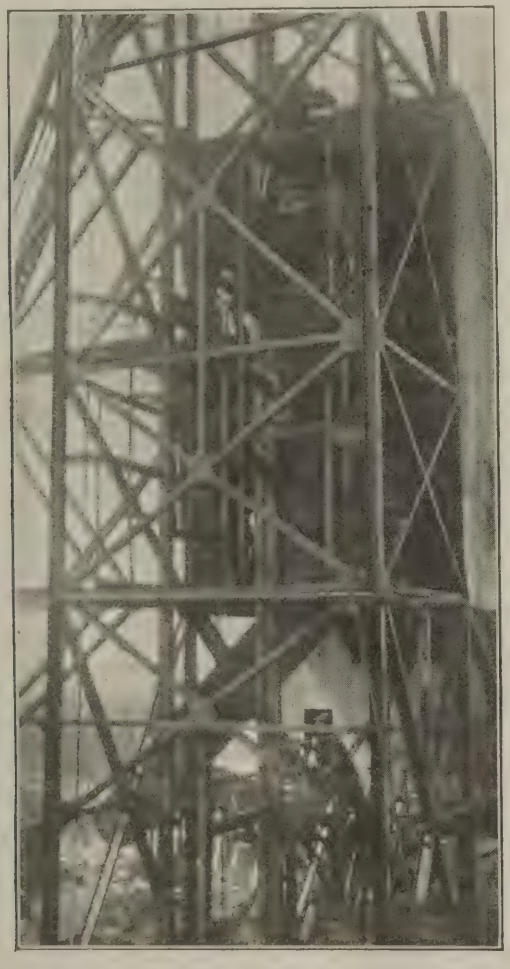

FIG. 4—HEADFRAME WITH CRADLE DUMPING

The cradle is standing perpendicular, the cage having arrived almost at the end of the dumping cycle. The chute for local coal sales also can be seen on the left of the illustration.

feature materially reduces the maximum peak load on the hoist, allowing the use of a smaller engine.

These cages are not operated with a slack rope. The dumping guides are so gradual that the hoisting engineer brings the cages into the guides at a fairly high speed and then throws on the brake, retarding the movement uniformly, until the cage finally comes to rest with the car in the overturned position. The loaded car is fully discharged by the time the empty car in the other compartment reaches the landing at the shaft bottom. This results in a smooth hoisting cycle, for it is not necessary for the engineer to bring the engine to a stop before going into the dump. It also shortens the hoisting cycle, for the car is dumped at a fairly high speed.

Another feature of these cages which tends to increase capacity is the positive and regular discharge

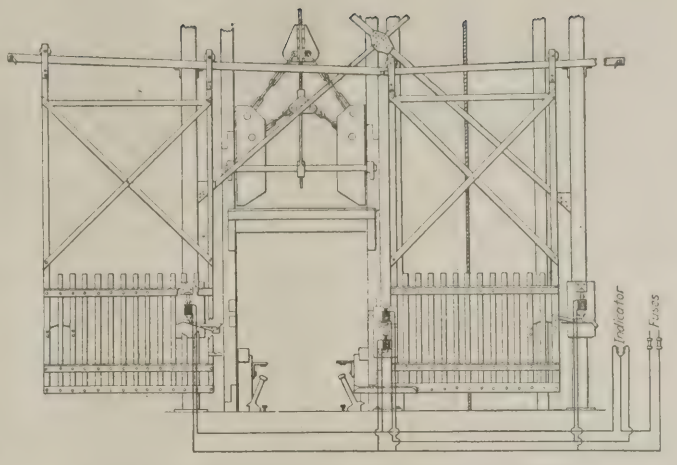

FIG. 5—CAGE GATES AT SURFACE LANDING

The gate can be opened only when the cage is at the landing and not then unless the emergency brake also is applied. The gate will remain open until the emergency brake is released; then it will close and lock.

at the dumping point without any chance of failure or any possibility of missing the dump. The dumping is progressive and positive, being performed by guides, and does not depend upon the engagement of a crane as with an endgate car.

A double reduction hoist equipped with automatic overwind, overspeed and emergency stop devices, driven by a 75-hp. alternating-current motor, raises and lowers the cages.

The new tipple was designed by C. E. Cowan, of Greensburg, Pa., the consulting engineer of the company, assisted by V. R. Velander, chief engineer for the Marion Machine Foundry & Supply Co., of Scottdale, Pa., which furnished the steel work and equipment. The tipple is of steel and is covered with corrugated galvanized iron. Liberal window surface and skylights have been provided to light all places where men have to work.

Coal Weighed in Basket After It Is Dumped

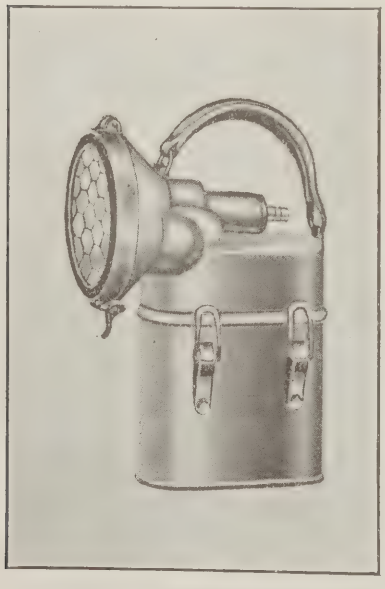
The coal passes from the cages over a dump chute to the weigh basket, where it is weighed by dial and beam scales, the weights being tabulated. When a counterweighted brake on the weigh-basket mechanism is released, the coal by its weight opens the door on the bottom of the basket, allowing the coal to pass to a receiving chute connected to the reciprocating feeder, where it is fed uniformly onto the apron conveyor. This conveyor is made up of ¼-in. steel-plate double-beaded flights 3 ft. long. These are mounted on steel thimble roller chain.

The rollers have cored oil cellars and are provided with wiching ring and push-plug oilers, making them self-lubricating. The coal is carried about 90 ft. on this conveyor, whereupon it passes to a chute discharging onto the shaker screen. Only one shaker is installed, the screen being of the double-deck type with a collecting hopper.

The lump and slack are separated in passing over the screen and are loaded onto the picking table through a specially designed discharge nose. The collecting hopper is provided with rack-and-pinion roller slide gate, which permits of full or partial opening, so that either any part of the slack can be loaded as desired or the slack can be passed over a discharge chute for loading on the slack track.

The picking table and loading boom unit is made up of ¼-in. steel plate single-beaded flights 5 ft. long

which are mounted on two strands of steel thimble roller chain, the specifications being similar to those for the apron conveyor. A mechanical boom hoist, gear-driven from the countershaft on the picking-table drive and controlled from the trimmer's platform, raises or lowers the boom, as desired. The discharge end of the loading boom is provided with a simple but effective device for reducing coal breakage to a minimum when topping the car.



Provision was made in the tipple for dumping slate by bypassing it through a flat door controlled by a lever on the weigh-house floor. It falls into a slate chute having a capacity of approximately 10 tons, the lower end of which is fitted with an undercut gate operated by means of gear segments and pinions mounted on a shaft, to which also is attached a pocket sheave wheel. This sheave wheel is operated by a chain of sufficient length that the undercut gate can be opened or closed from the ground level. The new equipment has a maximum capacity of 250 tons per hour.

A Lamp Suitable for Use in Coal Mines Which Burns Without Attention

IN TRAVELING around mines need often is felt for a lamp that will burn brightly and without mess or need of attention, one also that can be stood up without difficulty on the top of a loaded car or in some other more or less uneven place so as to give a ready light for writing or note taking.

Such a lamp is the Excellight, manufactured by the National Marine Lamp Co., at Forestville, Conn. It is a portable lantern the current for which is generated by two No. 6 dry cells contained in an aluminum casing. It has an adjustable focus that permits either a spread of light or a concentrated ray to be thrown. A push-button switch is conveniently arranged so that it can be instantly manipulated by the finger and thumb of the hand carrying the lantern.

No arrangement is provided for the extinguishment of the filament should the glass in front of the electric light be broken by a blow or fall or if the bulb itself also should become broken. It is not therefore a fool-proof lamp or even an accident-proof lamp in gas in such a degree as are the lamps approved by the U. S. Bureau of Mines. The glass, however, in front of the lamp is $\frac{3}{8}$ in. thick and reinforced with wire. Such a lamp would be well suited for use around powder houses and stables above, and perhaps below ground, though underground as a rule permanent lighting is provided. It would serve well also for the men employed on hay and powder cars, especially when special and covered wagons are not used. For firebosses, who need to come out to places of perfect safety when their flame safety lamps are accidentally extinguished, the type of lamp which will fit the pocket is preferable. It would be better still, of course, in every case to give firebosses, whose open lights may be extinguished, a lamp of the type approved by the U. S. Bureau of Mines.

ELECTRIC LAMP FOR NON-GASEOUS MINES

The lamp has two dry cells and an aluminum casing. The glass in front of the lamp is thick and reinforced by wire.

Mechanical Engineers Adopt a Decalogue

ADOPTION of a code of ethics, governing its membership of approximately 20,000, is announced by the American Society of Mechanical Engineers. Ultimately, it is expected, this code, prepared by a joint committee of the national engineering societies, will apply to the entire engineering profession, embracing more than 200,000 professional engineers. It runs as follows:

1. The engineer will carry on his professional work in a spirit of fairness to employees and contractors, fidelity to clients and employers, loyalty to his country and devotion to high ideals of courtesy and personal honor.

2. He will refrain from associating himself with or allowing the use of his name by an enterprise of questionable character.

3. He will advertise only in a dignified manner, being careful to avoid misleading statements.

4. He will regard as confidential any information obtained by him as to the business affairs and technical methods or processes of a client or employer.

5. He will inform a client or employer of any business connections, interest or affiliations which might influence his judgment or impair the disinterested quality of his services.

6. He will refrain from using any improper or questionable methods of soliciting professional work and will decline to pay or to accept commissions for securing such work.

7. He will accept compensation, financial or otherwise, for a particular service, from one source only, except with the full knowledge and consent of all interested parties.

8. He will not use unfair means to win professional advancement or to injure the chances of another engineer to secure and hold employment.

9. He will co-operate in upbuilding the engineering profession by exchanging general information and experience with his fellow engineers and students of engineering and also by contributing to work of engineering societies, schools of applied science and the technical press.

10. He will interest himself in the public welfare, in behalf of which he will be ready to apply his special knowledge, skill and training for the use and benefit of mankind.

The code was drawn up by a joint committee including representatives of the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers, the American Institute of Electrical Engineers and the American Society of Heating and Ventilating Engineers. Only the mechanical engineers have ratified it as yet, possibly because the others have not had a meeting at which the matter could be introduced. The representatives of the mining engineers are J. Parke Channing and Philip W. Henry, of New York.

Longwall Retreat with Face and Main Conveyors and Many Air Splits Giving Positive Ventilation

With This Arrangement a Single Panel May Be Made a Source of Production for a Sizeable Mine—Separate Well-Directed Split Ventilates Every Four Hundred Feet of Face

By F. C. Cornet*
New York City

RAPIDITY in extraction enables the coal operator to realize rapidly on the capital invested not only in the coal itself but also in the preparatory and development work by which this coal is made recoverable with profit. It is with this idea in view that the plans here presented have been formulated. They provide for the recovery of all the coal and for an increase in tonnage that can be recovered during a given time with a given expenditure on equipment.

Referring to Fig. 1, which shows one way of applying this method, lateral headings (designated in this case as Second Right and Third Right) are driven 504 ft. apart center to center, each heading having its air course on the lower side in the usual manner. Rooms 20 ft. wide and 400 ft. long are driven to the rise with a 200-ft. solid pillar between them. From the face of each such room a crosscut 20 ft. wide is driven to the next room, the alignment of these crosscuts leaving a continuous pillar 30 ft. wide to protect the air course of the lateral heading immediately above.

The lower rib of each of these crosscuts forms a longwall face 200 ft. long, along which a face conveyor is laid. These faces operate in pairs or sections. The conveyors of a section run toward each other so as to discharge onto a third conveyor installed in every other room, beginning with No. 2.

I have designated these rooms as "conveyor rooms" and the conveyors in them as "stationary conveyors," the latter being so named because they stay there until all coal in both adjacent pillars has been mined to within a distance from the heading varying from 50 to 100 ft. or even more, to suit the needs of the operation. As the faces advance toward the heading the stationary conveyors are shortened at their far end.

Stationary Room Conveyor Sunk in a Ditch

Though the face conveyors, which must be easy to move as the faces advance, will be of a light pattern, the stationary conveyors, in order to reduce their chances of getting out of order, may be of heavier construction. Though the face conveyors are laid on the pavement of the seam (which seam is in this case 36 in. thick) the stationary conveyors are laid in a narrow ditch cut in the bottom. Consequently cars and locomotives can pass over the conveyors when the rooms are being driven. In the instance shown in the various illustrations a total headroom of 54 in. having been found necessary for haulage, the depth of cut in the rooms is 18 in. This provides enough fall from the face conveyors to those that are stationary to permit the former to deliver coal very nicely to the latter. Toward its lower end, beginning a short distance from the heading, the stationary conveyor is bent upward, as shown in Fig. 2, for the purpose of elevating its head enough

*Consulting engineer.

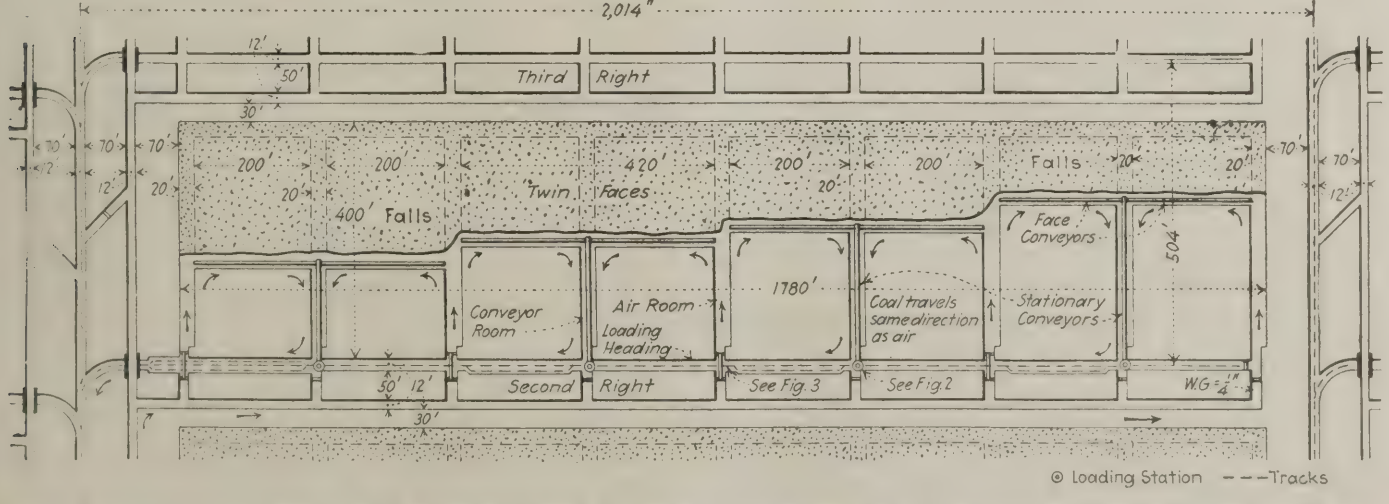


FIG. 1—LONGWALL RETREATING METHOD WITH MAXIMUM CONCENTRATION OF WORKING FORCES BUT WITH AIR SO SPLIT AS NOT TO RESTRICT THE NUMBER OF MEN ALLOWABLE BY LAW AND GOOD PRACTICE

By means of a pipe overcast the air is taken from the intake airway into the air room, up which it passes. At the longwall face it splits, runs past the two faces, returning by two conveyor rooms. The main difficulty from a legal standpoint would consist not so much in carrying out these plans after the workings had been developed to the stage indicated but in developing the work to that stage, for the conveyor and air rooms would have to be driven 400 ft. beyond any of the air passages provided. This could be done only by providing pipe ventilation for these rooms while driving them and the crosscuts between them. The distance might be greatly shortened, if grades permitted, by driving the rooms to meet from adjacent headings, making the distance from the adjacent airway at no point more than 200 ft. If the coal is thin and bottom is not lifted the air rooms could not be driven without specially low cars or conveyors being provided. Special cars might not be objectionable, as they might be already on hand and as they would be used exclusively in the development of new headings, making full trips of special cars feasible. All coal from the longwall faces is loaded at the heading with the cars at right angles to the conveyor.

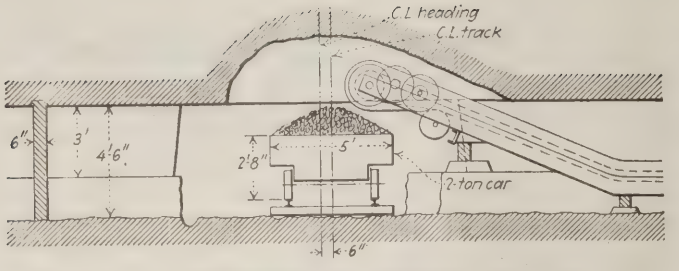

FIG. 2—ROOM CONVEYOR DELIVERING COAL TO CAR

As the car does not have to enter the room it can be made of almost any capacity desired. A lodging must be made for it in the roof, but as the frequency of this provision is only once in every 400 ft., that will involve little rockwork. The conveyor is sunk in a ditch in the room roadway so that the face conveyors can deliver the coal to it without elevation.

above the rail so that cars can be loaded well above their brim. This is called a "loading station."

The mine being in 36-in. coal, a lodging must be made in the roof, as shown, to permit this elevation. As the conveyor needs but little space and as the loading stations are 400 ft. apart, it is fair to say that, considering the large tonnage every station will be required to load, the slate work needed for this purpose will be insignificant. Were the cars, as is often the case, to be taken into what are here called conveyor rooms and placed under the face conveyors for lodging, a hundred times as much material would have to be handled. In the one case a large quantity of bottom would need lifting and in the other a little roof would be removed from the few and widely spaced loading stations.

Trackage and Gathering Cost Reduced

It is obvious also that this way of loading the cars on the heading itself not only reduces the trackage to a minimum but also favors expedition in loading operations. It will be noted that a three-track main siding is provided at the entrance to the heading and that secondary side tracks are constructed handy to each loading station, but nothing prevents making the loading facilities still greater by double tracking the heading completely above the three-track main siding. If this were done the heading would have to be made at least 17 ft. wide, which would take the place out of the yardage-paying class, leaving only the air course and its crosscuts to be driven narrow.

By looking at Fig. 1 it will be seen that the different sections are not in line with one another. The further a section is from the main heading, the further it also is from the lateral, or loading, heading. This is due to the fact that the work was started advancing. Any given pair of faces was started ahead of the pair immediately beyond it. Had the work been started retreating, the section furthest from the main heading would be closest to the loading heading, the distance between the latter and the different sections increasing toward the main heading.

For supervision, for ventilation and in order to permit the cutting machines to pass rapidly from one section to another, a communication way is kept open between successive sections. In order to minimize the expense of maintaining such communication, it is advisable to straighten the general face line as much as the working of the roof will permit. In general, if the work is in good hands, it will be found that the manner in which the roof works does not prevent keeping the face line practically straight if desired; indeed, the straight face has so much to commend it that most persons would prefer it. The kind of roof that permits this is often also the kind that will permit of keeping open a 50-ft. communication between sections as easily as one two yards or so in length.

The heading pillars can also be removed by similar methods. By heading pillars are meant here the protective, unbroken strip of coal left on the lower side of the air course, the pillars between air course and heading and those portions, 200 ft. long, of the large interroom pillars that will not be recovered through the conveyor rooms in the manner that has been described.

Referring more especially to Fig. 5, it will be seen that in the instance illustrated the widths of these pillars are, in the order named, 30 ft. for the first and 50 ft. for each of the other two. Figs. 5 and 6 show that the system adopted for removing these pillars is much the same as that previously described. Two face conveyors, running toward each other, discharge onto a stationary conveyor carrying the coal to a loading station where it dumps it into the cars.

The only noticeable difference between this and the loading stations described above is that in the present case the cars come to and depart from the loading station in a direction parallel, instead of at right angles, with the stationary conveyor. Above the loading station there is a tail track capable of accommodating as many empties as the gathering locomotives are able to handle at one time.

It is easy to see how loading facilities could be further improved by extending a little distance outwardly, and in a straight line, the tail track, joining it by a switch at its lower end with the main, or loading, track. This would permit shoving a trip of empties up the tail track without having to maneuver the trip of loads formed on the main track.

This would, of course, necessitate more rib slabbing than the drawing shows, but such liberty usually can be freely taken at this late stage of operations, even if the roof has been weakened as a result of close, intensive mining. If slabbing increases in slight degree the trouble of keeping the track clean, it will not be for long. It will be found good practice to move the position of the loading station outward on the heading about 350 ft. at a time—that is, every time the stationary conveyor will have been made 350 ft. shorter in the rear.

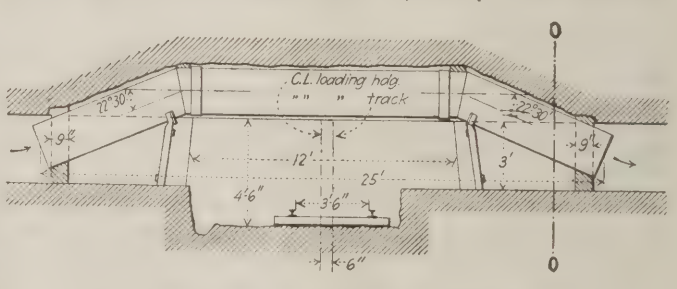

FIG. 3—AIR BRIDGE OVER MAIN ROADWAY

The air to be taken by this bridge is intended to clear only 400 ft. of face from noxious gases. Enough air is supplied to provide ventilation for forty men. Concrete stoppings are provided at both ends of the air bridge, the pipe passing through both of them.

As there comes a time in the operations when all that remains to sustain the output of the heading is the coal tributary to the set of conveyors in the heading pillars, it is important to plan the work in advance so that this set will load enough coal daily to its last day to keep at least one gathering locomotive occupied to capacity every minute of operation.

This will keep down nearly all the items of cost.

especially haulage, supervision and loading-station work. In order to do this it may be advisable to make the barrier pillar below the air course wider than 30 ft. and leave more than a width of 50 ft. above the heading to be mined when drawing heading pillars. Fig. 5 shows 130 ft. of actual coal face to be mined at such a time.

If, without changing the width of the middle pillar, the other two are so widened that the actual coal face will be 200 ft. instead of 130 ft. the daily output will be increased in the proportion of 130 to 200, that is, more than 50 per cent. This will go a long way toward reducing the idle moments of the locomotive, its crew and the men employed around the loading station.

The rooms of odd number, beginning with No. 1, have been designated as "air rooms" because they are used to convey air to the working faces. This air comes direct from the air course through a sort of semi-permanent overcast made of a galvanized-iron pipe of 24 in. diameter placed overhead across the loading heading.

Figs. 3 and 4 show how this pipe, lodged in a narrow cut shot out of the roof, does not interfere with circulation on the heading. Although light and inexpensive, this kind of overcast is most efficient. The pipe can be used over and over again anywhere in the mine.

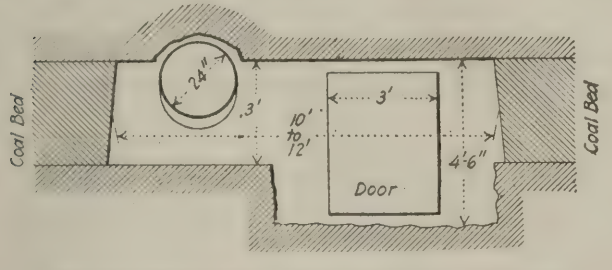

FIG. 4—DOOR AND CROSS-SECTION OF PIPE

The 3-ft. door is intended for use when taking a cutting machine to the shop whenever it is in need of important repairs. Ordinarily the men travel by way of the conveyor rooms but the door might be used by them in case of an emergency. It must be placed far enough back so that the machine can be turned into the main roadway without fouling.

Both ends of it are tightly encased in stoppings, preferably made of concrete, as shown.

In the upper stopping a door is provided, as shown in Fig. 4, through which the cutting machine may be taken in or out, as is found necessary. It is through this door also that the men will find an additional way of escape in case of emergency. It is not likely that the men would use this door ordinarily. They would prefer to travel by way of the conveyor rooms, where there is ample walking space alongside the conveyor, the latter being laid in a cut.

Under the small water gage of 0.25 in., the pipe overcasts, which are only 25 ft. long, are able to deliver not less than 8,000 cu.ft. of air per minute. This air traveling up the air room, splits at the head of it. One-half goes to the left, the other to the right, each split seeking the nearest conveyor room on its side, ventilating on the way one of the two faces of a section whose other face is ventilated symmetrically, that is, from the opposite side and direction, by a split of air coming from the next air room.

The two splits thus ventilating a pair of faces meet at the head of the conveyor room, go down it and return together direct to the outside. This is shown in detail in Fig. 1. By looking at the latter it is seen also that the first and last air rooms must furnish air to only one face each. Hence they will have to carry only

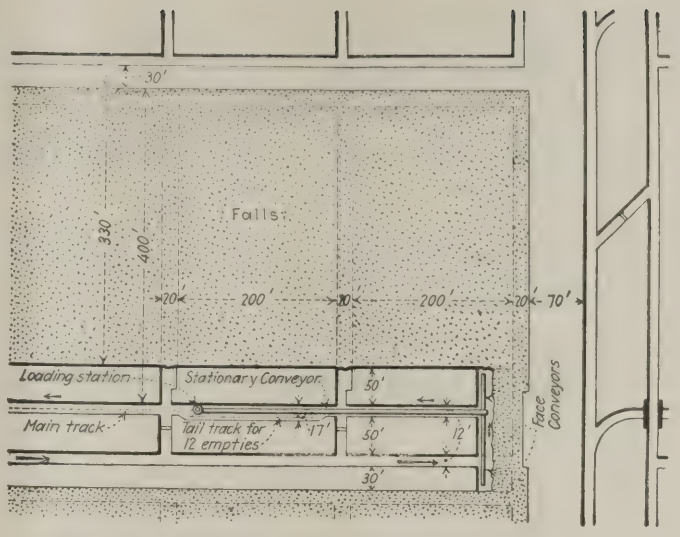

FIG. 5—WORKING OUT THE HEADING PILLARS

In this, as in the rooms, longwall retreating methods with face conveyors are used. In this instance, however, if the coal is thin, the main conveyor can be placed without excavation on a level below that of the bottom of the coal seam. All the side tracks and provisions for the delivery of air are already made, having been constructed for extracting the coal between the rooms.

50 per cent of the volume all other air rooms must carry. This is a matter easily regulated.

In the case of the last air room there is no pipe overcast, as none is necessary there. By building a stopping across the heading above the end of the track, and putting an ordinary regulator in the last crosscut, as shown, the volume of air running up the last air room will be regulated as desired.

In the example shown, Fig. 1, assuming that 4,000 cu.ft. a minute pass up each extreme air room and 8,000 cu.ft. up every one of the other three air rooms, the total volume is 32,000 cu.ft. per minute. This is at the rate of 4,000 cu.ft. for every single face. Figuring at 200 cu.ft. per minute per man, 160 miners may be put to work in the workings shown, or at the rate of 20 men per single face.

In other methods, including the room-and-pillar, the air intended to ventilate the workings off a lateral heading is let out of the air course in a single body through the last crosscut. No matter how large may be the volume thus allotted to the workings, the whole of it counts as one split only and the maximum number of men who may work in it is fixed by law. In West Virginia, for example, it is 60 men.

If only that number of men were put to work in such workings as are shown in Fig. 1, an average of only 7.5 men would be employed on a single face. If it takes 20 men one 8-hour shift to load out a cut and do all work necessary to make the face ready again for another operation of the cutting machine, it must take 7.5 men 2.66 shifts to do the same. In the former case six cuts a week are obtainable from a face. In the latter case it is not probable that any face would average more than two cuts a week.

This method retains all these advantages due to special ventilation no matter how many working sections there may be off a single working heading. Fig. 1 shows only four sections, but a dozen might as well have been shown. So long as the air course can deliver the air necessary, there is no limit to the number of sections nor to the number of miners who may be lawfully employed off a single working heading.

As many men are centralized and efficiently employed in the single second right heading of Fig. 1 as are

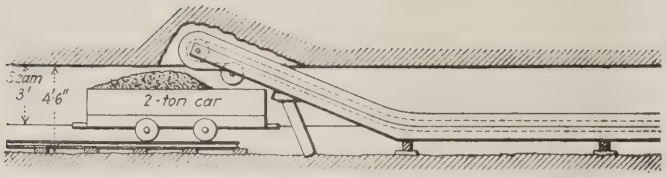

FIG. 6—LOADING COAL FROM HEADING INTO CAR

The conveyor can be moved forward—or should it not be rather backward?—350 ft. at a time. The expense for creating the necessary headroom accordingly is not large. The car is loaded from the end, which is not as desirable as from the side as far as continuity of operation is concerned.

ordinarily found in half a dozen headings scattered over an immense area in the average bituminous-coal mine.

The method presented is characterized by the following advantages, several of which are found in no other method:

(1) Minimum of narrow work per acre of coal operated.

(2) Working faces in every instance ventilated by fresh air brought direct from the outside in any volume desired so that no air that has passed along any working face will pass along any other on its way to the outside.

(3) Cutting machines invariably find within easy reach all the work they are capable of doing, making it unnecessary for them to waste precious time moving from place to place.

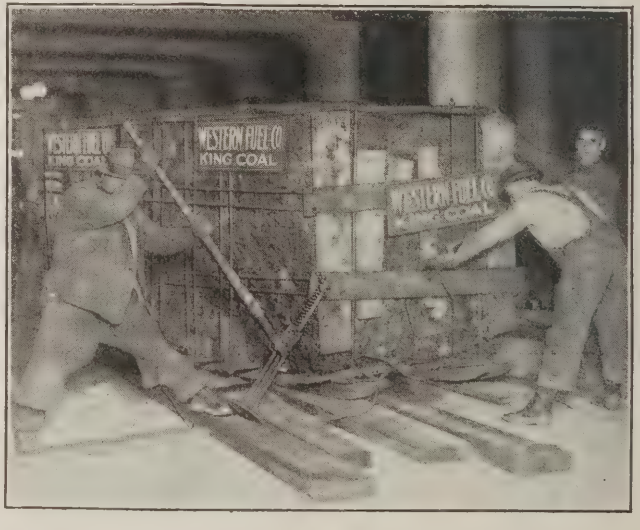
(4) Minimum of track work needed.

(5) Reduction in haulage cost due to the location, layout and equipment of the so-called "loading stations" where the cars drop continuously to loading position, to drop away in like manner after loading, being then made up instantaneously into trips. The gathering locomotives move the empties and loads only in trips as heavy as they can handle safely and economically. The locomotives are not only kept moving all the time but never move without being loaded to capacity. The cars also are kept in constant motion and consequently a minimum number of cars and locomotives will permit the mining of a maximum tonnage in a given time.

(6) Ways of approach to the working faces, whether intended for ventilation, the handling of coal and supplies or the going and coming of the men, are everywhere in the solid and at all times the men will find several roads to safety.

(7) Pack walls are not needed and no labor need be performed back of the faces except the necessary timbering and whatever salvaging of timber may be deemed advisable and judged safely practicable.

(8) Muscular power is used to best advantage owing to low and short-throw shoveling.



(9) Faces can be kept in working shape at all times at low expense whether the mine be operating or idle.

(10) In any given seam and for a given capacity and style of rolling equipment less brushing of slate is needed than with any other mining system.

(11) Due to a special system of ventilation, an aggregate face development can be provided, lawfully, safely and easily, which is capable of yielding a daily tonnage such as with other methods is obtainable only by multiplying the number of working lateral headings at the corresponding expense for increased trackage and rolling equipment, maintenance and supervision, to which disadvantage of ordinary plans must be added a proportionate multiplication of all kinds of delays and accidents.

(12) Every lateral heading is autonomous in its operation, constituting in itself a separate mine, one in which the system may be applied advancing or retreating, as the operator may choose.

Big Lump of Utah Coal Placed on Exhibition in State Capitol

What is said to be the largest lump of coal ever mined has been placed on permanent exhibition in the Utah State Capitol, in Salt Lake City. The lump was placed there at the request of the Secretary of State, H. E. Crockett. The block was mined at the King mine in Mohrland, Utah. It was found 2,000 ft. underground. From the mine mouth to the railroad at Hiawatha the lump traveled a distance of 6,000 ft. by tramway. Special equipment had to be made to handle the lump in the mine. The coal was taken from a seam 30 ft. thick. It was undercut and uppercut by machine, the sides and back being shaped by hand. The cost of digging and handling from mine to the Capitol Building was approximately $2,000.

The block is 5 ft. square and 10 ft. long and weighs 22,000 lb., including the iron bands which form its crate. These bands weigh 1,100 lb. To convey the huge lump to the Capitol eleven horses were hitched to the specially constructed vehicle carrying the coal. The 11-horse power proved futile. Then five horses and a motor truck were employed. This equipment negotiated the steep grade to the State House.

Contrast Between Our Lignite and German Brown Coal

Cologne Brown Coal Is Almost Two-Thirds Water, Ours One-Third —German Product Has 2½ to 13 per Cent Agglutinating Matter, Ours Less Than 1½ per Cent—Brown Coal Soft, Ours a Mineral

By O. P. Hood*
Washington, D. C.

ALTHOUGH I had read many reports about the brown-coal industry of Germany, actual inspection gave me several impressions for which I was not prepared. We had fallen into the careless habit of thinking about German brown coal and American lignite as similar material. The great briquetting industry which has been built upon German brown coal has been frequently pointed to as an example of what we should do with our own lignites. This puts one in a frame of mind to expect a greater similarity in raw material than actually exists.

Analyses of the two materials indicate a great difference in water content. Our lignite has approximately 35 per cent moisture, whereas German brown coal in the Cologne district has about 60 per cent. Along with this difference in the moisture content is a considerable difference in physical character. Brown coal is much more like earth than like rock. It is far less consolidated than our lignites. We would not think of trying to force a spade into a bed of our lignite, but this would be quite possible with much of the German brown coal.

A piece of brown coal slightly consolidated and 3 in. thick is readily broken with the fingers like a piece of corn bread. Throughout a mass of brown coal small pieces of wood are much in evidence. The binding material between the annual layers of wood growth has almost disappeared, leaving the thin chips to curl and crumble when exposed to the sun. One small pile of brown coal exposed to the weather for a couple of months has the appearance of a chip pile.

Most of the Coal Is of Earthy Texture

These woody pieces have turned a dark chocolate brown, and they have various degrees of friability. Occasionally large chunks of wood are found that would offer considerable resistance to any digging device. The beds in various places vary in the proportion of fine and coarse material but in general the material is distinctly earthy. When taken to the briquetting plant the brown coal is passed over screens which take out pieces over about 3 in., and these are diverted to the boiler house for steam making.

The remaining material above ½ in. is readily broken up in a disintegrator. Our own lignite would have to be put through rolls or a jaw crusher. The vegetable growth that furnished these great beds varied from time to time, so that in some places there is a distinctly banded appearance, the color varying from various shades of chocolate brown to a light yellowish brown. In mining by hand the material is easily dislodged with pick and shovel. Blasting seems unnecessary, and the excavating machinery scrapes it off a steeply inclined face.

Our own lignite, however, is consolidated, so as to be quite comparable in hardness with our more familiar bituminous coal. It is mined in the same manner as is soft coal, by the use of coal-cutting machines and explosives. It usually occurs, also, in measures that have rock above and below, whereas in the German measures the overburden is sand, gravel and clay. These differences are responsible for the different methods of working. The greater part of German brown coal is taken from open pits by means of excavating machinery.

There is a limit, of course, to the depth of the overburden, as compared with the thickness of the coal, that can be economically removed, and when this limit is exceeded underground mining methods are used. Those parts of the beds that can be worked from open pits are developed first, but as the industry grows older the deeper lying portions will be worked by underground mining at a higher cost.

Our own lignite can in places be stripped of the overburden by excavating machinery, and can be loaded into cars by the same machines. This work probably would be done by our standard dipper excavators, and machines of this type are to a limited extent used in brown coal, but the relatively easy digging together with the uniformity of material has led the German engineer to develop in high degree the chain bucket excavator for this work.

Beside these physical differences there are important chemical contrasts. Certain materials in brown coal, on being heated, form an excellent binder and waterproofing material. The temperature at which this material develops is well below that of the distillation of any of the other coal substances. The percentage of this binder in the raw material must be at least 2½ per cent if briquets are to be produced by the German method. This method, briefly, is to subject the brown

CHAIN BUCKET CONVEYOR DIGGING BROWN COAL

This coal deposit is so soft that it can be dug like sand by a dredging bucket or "landbagger." Note the soft partings in the coal and the smoothness of the excavated surface. This system would work with American or other peat but not with American lignite. This illustration is from a photograph made in the Nieder Lausitz district.

*Chief mechanical engineer, U. S. Bureau of Mines.

WORKMAN IN GALVANIZED-IRON BOOTS CUTTING DITCH

Scene from a brown-coal mine in the Nieder Leusitz district. Even the boots in Germany are "ersatz," or substitutes, in some cases. These fields needed much drainage. Note the pick with its novel fastening and single point—somewhat light for digging clay. The pick shape shown is prevalent in the mines of Continental Europe.

coal, which has been dried to a moisture content of about 13 per cent, to high pressure, pushing it through a converging die which generates sufficient heat by friction to melt the inherent binder and thus waterproof each particle. Different brown coal beds possess this natural binder in varying quantities up to more than 13 per cent.

The low-temperature distillation of this material yields lubricating greases and paraffine from which candles are made. Most of our American lignites have binding material of this sort in quantities less than 1½ per cent. This immediately suggests that our own problem of briquetting is fundamentally quite different from that of the German brown-coal area. We are quite justified in looking to the development of the brown-coal industry as an excellent example of what can be done when it is necessary to beneficiate a low-grade fuel, but we are not justified in looking to this example for specific technical detail as a solution of our own lignite problem.

America has a lignite problem that must be solved in our own way to fit our own raw material and to suit our own economic conditions. The German brown coal occurs in well-populated districts where there is a high degree of industrial development coincident with a scarcity and relative high price of other fuels. It is in the possession, also, of a people who have not always had the choice of an abundance of the best coal and who have already acquired an attitude of thriftiness toward the use of heat.

Our own lignite occurs in districts furnishing a far less concentrated market and a much smaller degree of industrial development, and where the distances from coal field to a market are much greater. Our lignite also occurs among a people quite familiar with some of the best coals on earth and with habits of using heat in quantity, particularly for domestic purposes, quite unknown to European habit.

The brown coal industry of Germany at the present time is rapidly developing, as a result of the scarcity of industrial fuel. There is a real shortage of fuel which can be met in the most expeditious manner by the development of brown coal. While a relatively small percentage of Germany's total fuel resources are in the form of brown coal, they are turning to this portion for rapid development at this time. There is enough of this material to last from eighty to a hundred years, and the methods of mining and treating have been developing since about 1856, so that practices are substantially standardized and can be applied with little risk and uncertainty.

In 1921 the total output of brown coal was 123,000,000 tons, while more than $28,000,000 tons of briquets were produced. The raw brown coal is used for industrial purposes on step grates, but since it has only from 3,200 to 4,500 B.t.u. per pound, it is quite evident that it cannot be transported any great distance, except under extreme need. The briquets, on the other hand, make a most excellent fuel for industrial and domestic consumption.

It takes about three tons of brown coal to produce one ton of briquets, one ton of the raw material being required to reduce the remaining two tons to one of briquets. The briquets, however, have a fuel value of about 8,600 B.t.u. per pound. Although they have less heat value than good natural coal, these briquets are sometimes preferred by the domestic trade because of their convenience and cleanliness.

Many Engineers Enter Commercial Branches

THAT engineering college graduates are handicapped without a supplementary commercial training is the basis of research investigations just completed by Dr. W. F. Rittman and W. F. Reilly, of Carnegie Institute of Technology, Pittsburgh. In the *Carnegie Technical Journal*, a quarterly publication of the alumni and students of Carnegie Tech. Dr. Rittman and Mr. Reilly present substantial proof of the need of commercial training in technological college courses.

With the co-operation of the alumni office, a study of the present occupations of Carnegie Tech. graduates was made. Of the graduates from 1908 to 1921, the investigations showed that approximately 67 per cent of the total engineering graduates are now engaged in commercial or managerial work. This majority becomes significant in consideration of the fact that "engineering" graduates include a wide range of highly technical fields such as mechanical, electrical, civil, chemical, metallurgical, mining, sanitary and science.

An interesting tabulation in the report shows the following percentages of engineering graduates in all departments who are now in commercial or managerial capacities: Mechanical engineering, 65 per cent; electrical engineering, 60 per cent; civil engineering, 73 per cent; chemical engineering, 59 per cent; commercial engineering, 91 per cent; metallurgical and mining engineering, 67 per cent; sanitary engineering, 60 per cent; science, 77 per cent.

Pack Coal with Caterpillar Tractor to Prevent Storage-Pile Fires

THE tendency of bituminous coal to fire spontaneously when stored in large quantities long presented a serious problem to the Philadelphia Electric Co. and others who are compelled to store coal for months or even years at a time, says an article by James R. McCausland in *Current News*, which is published by that company's section of the National Electric Light Association.

The Coal Bureau, among whose duties are included the extinguishing of such fires and the development of methods for preventing them, has been experimenting with methods of storing coal for several years and has now arrived at a solution which is proving successful.

Some kinds of coal are entirely unsuitable for storing under the best conditions, but even good coal stored improperly will develop fires. When a fire is discovered in a storage pile the only satisfactory method of extinguishing it is to dig it out, remove the coal to another section of the yard and spread it out to cool. Water is not effective on these fires, nor can they be smothered by covering with fresh coal.

The method of storing coal most used formerly was by locomotive crane. The crane hoisted the coal from the cars in its clamshell bucket and then swung around and dropped the bucket load on the storage pile. It was found quite early that about 10 ft. was the maximum height to which coal safely could be stored by this method. It was later found that the susceptibility to fires of coal stored in this way was due to the fact that all of the lumps in any bucket load rolled down to the bottom of the pile, forming a honeycomb arrangement through the spaces of which air could reach the interior of the pile, while the fine coal was all left at the top of the pile. This infiltration of air to the center of the pile caused gradual heating up to the ignition point.

To discover, if possible, this heating before a fire developed or at any rate before a large quantity of coal was consumed, temperature observation pipes reaching to the bottom of the pile were placed at intervals, so that thermometers could be inserted and any rise in temperature noted before the danger point was reached. This method, however, was not always effective, because fires have been found within 5 ft. of the temperature pipes without causing a noticeable rise in temperature at the location of the pipe. Furthermore, fires were not prevented in this way but merely discovered early and kept under control.

It was found that storing by contractors' dump wagons was an advance over this method because all the coal, lump and fine, was left at exactly the location in the pile at which it was dumped and there was no concentration of lumps at the bottom and fine coal at the top of the pile. Also the trampling by the horses and rolling by the wagon wheels compacted the coal quite thoroughly, greatly reducing the spaces through which air might circulate. This method has disadvantages, however, which caused a further solution to be sought. Storing by contractors' dump wagons is practically prohibitive in cost—about three times that by locomotive crane; it is very slow; and coal is wasted by being pulverized and blown away, and also by being dragged down the side of the pile and ground into the mud or cinder fill in the storage lot.

FIG. 2—HERE THE COAL IS DUMPED BY MOTOR TRUCK

The caterpillar tractor is on hand, making firm and air-resisting the first bed of coal spread by the motor truck. Plank is laid for the truck so as to prevent the excessive breaking of the coal. When ground too fine it is likely to be blown away.

An idea taken from the war has resulted in the development of the method now being used. At yards having locomotive cranes the coal is spread by the cranes in layers 3 to 4 ft. in thickness and then rolled, as shown in Fig. 1, by a caterpillar tractor—a small second cousin to the tanks used in France for rolling out the Hindenburg line. The tractor hauls a drag made of rails, and by the action of this drag as well as by the rolling effect of the tread of the tractor the coal is compacted just as by wagons. Where there are no locomotive cranes motor trucks are now being used instead of horse-drawn wagons and have proved themselves highly superior. They can handle much larger quantities of coal in the same time, the cost is much less, and the pulverization of the coal is practically eliminated by planking over the drive by which the truck reaches the dumping point. This modification of the method is illustrated in Fig. 2.

FIG. 1—CATERPILLAR AND DRAG COMPACTING COAL

The coal is laid by locomotive crane in layers 3 or 4 ft. thick. The caterpillar tractor with a rail drag is then run over it, which makes it so tight that air for its combustion is excluded.

In addition to preventing fires the method last described permits at least a third more coal to be stored on a given area because it has been found already that a height of 12 to 14 ft. is entirely practicable. Further experience may show that the maximum height may be raised even more than this.

Reading Power System When Completed Will Be Largest in Coal Mining

IN ITS Schuylkill County and Northumberland County operations the Philadelphia & Reading Coal & Iron Co. is developing what in its entirety will be the largest electric power system in the world that is devoted entirely to coal mining and one of the largest purely industrial electric systems in this country.

It will eventually comprise five or six large modern power stations, tied together in one great system supplying power to the company's forty-odd operations, to the Pottsville shops and to incidental uses. The individual plants will generate from 15,000 to 20,000 kw. each, and the total power will be at least 100,000 hp.

There will be 85 miles of high-tension line, carrying a current of 23,000 volts, and additional secondary mileage in the way of service connections and direct cables, through boreholes, to powerful pumps in the mines. These pumps will operate at the high tension, and some of these installations, notably at the Draper mine, are completed.

Would Light Every House in Philadelphia

The completed system will, at a conservative estimate, supply enough power to illuminate every house in a city like Philadelphia, with some left over for general purposes. Its development foreshadows at the Reading mines the almost universal substitution of electricity for all other forms of power in operating mine and breaker machinery, and it also implies the elimination of seventeen engine-driven non-condensing power plants—sixteen at mines and one at the Pottsville shops.

Two modern electric plants which will be incorporated in the new system already are in operation—a 5,000-kw. plant at Good Spring and a 4,800-kw. plant at Locust Spring. These plants are tied together now in a system which runs from Brookside, in the west end of Schuylkill County, to Pine Forest, a little north of Pottsville, thence north to Indian Ridge, near Shenandoah, and thence west through the Mahanoy Valley to Locust Spring, the total mileage of primary high-tension line already being about 55. A line is now being built from Locust Spring to Bear Valley, west of Shamokin, and later a short link will run from Bear Valley to North Franklin at Trevorton, the extreme northwest of the Reading properties. Next summer a line will be run south from Pine Forest to Pottsville, to supply the shops, and another line will run from Pine Forest to Silver Creek on the east. At Silver Creek one of the proposed new plants will be built.

An additional extension from Indian Ridge to North Mahanoy and the territory now supplied by the old North Mahanoy plant will complete the high-tension mains already in operation. The old electric plants will not be scrapped but will be retained as emergency units.

The great extent to which electricity is used by the Reading, even under the present system of isolated stations, is shown by the statistics. The company is now operating more than 100 miles of underground trolley line, has 140 electric locomotives in service, operates 106 electric pumps and charges about 9,000 electric lamps for miners. Incidentally it has its own independent telephone system, with independent trunk lines and with six exchanges, reaching every part of the property.

The Good Spring plant, opened in June, 1919, was the first unit designed for the proposed new system, and it typifies in a general way what will be done at other plants. This station was placed at Good Spring because that point is central for the Tremont district, because ample supplies of barley coal were available at that colliery, and because Pine Creek, near by, supplied sufficient water for effective operation. The boiler plant and dynamo room are constructed of brick and steel. There are seven Stirling water-tube boilers generating 4,500 hp. and fitted with Coxe traveling stokers. Coal is supplied from overhead bunkers, which are fed by a conveyor line from a large bin, the bin in turn being supplied with coal by an aërial tramway running to the foot of the breaker. Ashes are disposed of by a flushing system which washes them into a large tank, whence they are hauled by a 20-ton car to the spoil bank. The boilers have automatic regulators controlling the speed of the stokers, thus maintaining constant steam pressure, and each boiler has a steam-flow meter to indicate the actual work it is doing.

The generating equipment consists of 5,000-kw. steam-turbine generators operating at a pressure of 150 lb. and condensing at a vacuum of 28.5 in. The condensers are of the barometric type.

Power is generated at 6,600 volts and conducted to an eleven-panel switchboard equipped with indicating and recording instruments for measuring electric current. It is controlled through oil circuit breakers and is distributed to the collieries in the Tremont district at a line voltage of 6,600. For long-distance transmission there is a transformer station which steps up the potential to 23,000 volts, and it is carried through the rest of the circuit at that voltage. At each colliery supplied from this high-tension line a transformer station is installed, equipped for measuring and controlling the power consumption at that mine, the voltage being stepped down from 23,000 to 2,300 for colliery distribution. At present there are twenty-two transformer stations installed, having a combined capacity of 25,300 kw. These stations, like the power station, are protected from lightning by means of the latest oxide-film lightning arresters.

Pumping Problems Above and Below Ground

Water for Good Spring is obtained from Pine Creek, 5,600 ft. distant, and is pumped to an elevation of more than 800 ft. To save water in operation, all the water from the condensers is pumped by centrifugal pumps through spray systems which reduce the temperature from 100 deg. to 85 deg., the same water being used continuously and the evaporation being less than 2 per cent.

Pumping is expected to be the constantly increasing consumer of electric power, as at present an average of 11 or 12 tons of water is raised for every ton of coal, and the proportion of water per ton mined may be expected to increase as the mines go deeper.

In addition to the general saving which a modern power system, such as described, may be expected to show over a group of isolated colliery stations, there will be a large saving in fuel. Good Spring burns nothing but barley coal, thereby releasing the larger sizes

which are required elsewhere, and each additional plant to be erected in the new system will accentuate the saving in this direction.

Rotary and Endgate Dumps Compared

AT THE Coal Mining Institute of America the value of rotary dumps was questioned by a member located at Beaverdale, Pa. He asked "At drift or slope mines where the coal is 3 or 4 ft. thick are rotary dumps more efficient than crossover dumps?" In his reply Sheldon Smillie said he supposed the thickness of the coal was mentioned in the question as a means of determining the size of the car used. Evidently the interlocutor felt that with a small car the rotary dump did not have sufficient capacity and reduced the tonnage dumped. The rotary dump is a crossover dump, but, that point conceded, it is as well to use the parlance most frequently adopted and regard the "crossover" as being the ordinary crossover end dump.

The regular crossover, if crowded, can dump eleven cars a minute, but that cannot always be attained, said Mr. Smillie. The rotary single-car dump is guaranteed to discharge four cars per minute. In practice it will dump under pressure eight or nine cars in a minute. The solid car which the rotary dump will discharge is cheaper than the endgate car which the end dump demands, but there is not much difference in the cost of the smaller sizes of the two types of car.

The main argument for the rotary dump is in the upkeep. The West End Coal Co., in the anthracite region, declares that $5 per annum is spent on each endgate car for such repairs as occur to the endgate or are due to the weakness which the use of the endgate causes. The introduction of the solid car has made it possible to make the flare on the side of the car horizontal and to let the wheels protrude into the car body, the tops being covered over with a light housing. It has also made it possible to build wider cars than heretofore, with further increase in capacity.

The solid car reduces leakage. At one mine, before the solid car was introduced eight men were kept steadily employed cleaning roads; now two men perform that service satisfactorily. Of course, as the cars at the mines before and after the change were loaded only level full, the comparison cannot be applied without much revision to conditions where the loads are built up several inches above the tops of the car sides.

Leakage keeps the rail covered with coal and, as the coal is wet, gives a rail with low adhesive qualities. In consequence much sand is used, and the coal shoveled up from the track is so mixed with non-combustible as to be of little value for combustion. As the coal in falling is broken it becomes so fine that it mingles with the sand and then cannot be separated.

With the endgate car the coal that is built up above the sides is likely to be dumped over the top of the door instead of through the door opening. In that case the coal is badly broken. The end-dumping car also refuses to dump completely when the coal is wet. The coal may have to be jarred loose or shoveled. With a rotary dump which will jar the car in the overturned position wet coal is readily discharged. The long rotary dump which will discharge a train of cars without uncoupling not only saves the work of dissembling and assembling the trip but gives all the advantages of train operation.

One car may run harder than another. If a nimble car follows a stiff one on a crossover dump it may catch it at the kickback switch and cause a collision. The grades must be made for the badly running cars with the disadvantage that the better cars will almost run away and need some holding back. But working with trips a sort of average is struck and one trip will act much like another when passing over the same grade, and the grades can be made to suit this condition.

Another advantage with the rotary dump is that no tipple need be built. The cars need not leave the hill. They can be dumped on the side hill and the coal allowed to run down a chute to the car, the screens or a picking table, as desired, that is if conditions are favorable to such an arrangement. All that is needed is a shed to protect the screening and picking devices. Thus much timber is saved. With the crossover end dump the track must be turned at right angles to the hill and the tipple extended far enough to provide for a kickback.

J. Milton Duff being called on said that the leakage from an endgate car was not considerable. Most of the coal on the mine track resulted not from leakage but from spillage. Trouble had been found with rotary dumps from the fact that coal sometimes wedged between the car and the plate in the revolution of the dump. He said also that eleven or even twelve cars had been dumped per minute over the crossover and that eight cars was the capacity on which figures usually were based. Eleven or twelve cars per minute can be dumped only where one-ton cars are in use. However, ten cars can be discharged per minute where they are of two-ton capacity.

Japanese Store Coal with Belt Conveyor And Box-Car Loader

ONE of the simplest ways to store coal and well suited to small-capacity storage is to use a portable belt conveyor or a series of them. At a Japanese plant shown here a Link Belt conveyor is caused to deliver coal to a Pratt box-car loader. This loader is intended for delivering sand and other materials to the far end of a car, and for this it is well fitted, as it takes up little space itself and can be readily managed in small compass. It is, it is true, a little rough in its operations, but as the coal it is handling is already fine and as it is delivering onto a pile of slack no damage is done such as might accrue with a high-grade lump coal, especially when falling on an unyielding floor. For those who regard a steam or electric shovel as too expensive the use of a conveyor of one type or another will greatly appeal.

ONE OF THE MANY WAYS IN WHICH COAL IS STORED

At this plant in Japan a conveyor and a box-car loader are being used to transfer coal in storage.

Book Reviews

Tentative Standards for Testing Materials

Every year the American Society for Testing Materials issues a book entitled A.S.T.M. Tentative Standards. This year 163 such standards are included—18 relating to steel, wrought and cast iron; 13, to non-ferrous metals; 27, to cement, lime, gypsum and clay products; 15, to preservative coatings; 13, to petroleum products and lubricants; 35, to road materials; 4, to coal and coke; 9 to waterproofing; 5, to insulating materials; 4, to shipping containers, 12, to rubber products; 4, to textile materials and 4, miscellaneous. The tentative standards are printed for one or more years with a view to eliciting criticism, of which the committee concerned will take due cognizance before recommending final action by the society.

Specially interesting to coal-mining engineers may be mentioned those on carbon tool steel, boiler and firebox steel for stationary service, lap-welded and seamless steel and lap-welded iron boiler tubes, iron and steel chain, merchant bar iron, foundry pig iron, chilled cast-iron wheels, chemical analyses of plain carbon steel and alloy steels, heat treatment of carbon-steel castings, white-metal bearing alloys or babbitt metal, compressive strength of portland-cement mortars, concrete aggregates, compression tests of concrete, test for fusibility of coal ash, shatter test for coke, terms relating to coal, structural Douglas fir, testing small clear pieces of timber, testing insulating varnish, testing electrical porcelain, testing transformer and switch oils, insulated wire and cable, cotton or rubber-lined fire hose, wrapped hose and braided hose for use with pneumatic tools, steam hose, rubber belting for power transmission purposes, adhesive tape for general use for electrical purposes, rubber insulating tape, rubber gloves for electrical workers, rubber pump valves and testing rubber products.

Some specifications—only a few—are too broad, such as the one specifying that lump coke should be dried at a temperature between 104 and 200 deg. C. and that the depth of a coke shatter box shall be approximately 15 in., which is objectionable because the height of the box is a part of the distance the coke has to fall. A little breadth is sometimes needed in defining a product like, say, gasoline or carbon steel, but why not in describing the equipment for a test? Attention will be called elsewhere to the definition of volatile matter in coal. The book contains 774 pages and measures 6 x 9 in. It is a credit to the painstaking and scholarly society by which it is issued, whose address, by the way is 1315 Spruce St., Philadelphia, Pa.

Chemistry for Coal Salesmen and Others

Parr's third edition of "Fuel, Gas, Water and Lubrication" (McGraw-Hill Book Co., New York), though written as a brief survey of the chemistry of these materials and designed for use by the engineering student, is a valuable book for the coal salesman. Here will be found the elementary things about coal that must be learned by any coal man who must tell about his product.

Following a brief but useful statistical summary of the reserves and production of coal are chapters on sampling, analysis, classification of coals, coal contracts, combustion, storage and spontaneous combustion. The treatment, of course, is technical, not popular, but the ideas are carried to the eye by diagrams and tables in such a way that the non-technical may easily grasp them.

That the majority of examples and much of the discussion center around Illinois coals—the book is based on lectures by the author at the University of Illinois—does not detract from the usefulness of the work.

Boiler waters and their analysis are covered, as are the subjects of coke and gas.

Even more technical will be found "The Practical Chemistry of Coal and Its Products," by Findley and Wigginton (Benn Brothers Limited, London). This book is intended for chemists at gas works and coke mines.

Sampling and the elementary form of analysis of coal are simply covered. What will doubtless be of more value to works' chemists are the outlines of analytical methods of determination of the light oils, benzol, toluol, etc.

The work throughout is characterized by brevity of treatment. No words are wasted, but the meaning is clear. The analysis of mine gases is treated in 8 pages. It is a book for chemists and not for laymen.

Transvaal Chamber of Mines Report

The thirty-second annual report of the Transvaal Chamber of Mines, covering the year 1921, was published in Johannesburg on Aug. 9, 1922. As its title implies, its 271 pages are devoted to a review of mining conditions in the Transvaal. In addition to detailed reports of the Chamber, its activities, membership, the work of its various committees, etc., there are several appendices devoted to the mining industry as a whole.

Appendix No. 1 deals with the Chamber's correspondence and reports on native labor, dust allaying, survey commission, customs tariff and other important subjects coming within the scope of the organization. The second appendix outlines the case of the Chamber in its dispute with the South African Industrial Federation. Follows a chronological account of the dispute on the Transvaal gold and coal mines; comprehensive statistical tables on mineral production, dividends, labor, etc.; reports of quarterly meetings, and records of the companies registered and liquidated during the year.

The statistical data are very complete, well presented and of considerable use for historical and other purposes. Aside from this feature, however, the report is of value chiefly to the Chamber's membership.

Forms for the Labor-Purchasing Department

Two of the new ventures in industry are the purchasing and personnel departments. The former is the older of the two. It started out, it is to be feared, with the motto unexpressed but too often implied: "Anything so it's cheap." Purchasing departments have reformed. They are beginning to put quality, life, adaptability and the responsibility of the firm supplying the goods ahead of mere cheapness.

The personnel department, on the other hand, always has striven for quality. It was given a price and told to get the best value it could for the money. Much is known about its methods, and C. N. Hitchcock, of the University of Chicago Press, Chicago, Ill., in a small paper-backed volume entitled "Forms, Records and Reports in Personnel Administration," has brought together much of this information. This little book of 127 pages measuring 6 x 9 in. contains 103 different forms and appears to be a painstaking compilation.

After a man has been employed the employer frequently wonders why he did not make certain inquiries as to the employee's fitness. A form filled out at the time of the employment will prevent such an oversight, and a correct record will aid in averting the re-employment of a man whose previous record was unsatisfactory. There are many other uses for such records. In future we may be more careful as to whom we introduce into our industrial families, and we shall then have less trouble in our industrial organization, for men will strive to meet and retain the qualifications which personnel departments require.

IN PREPARATION FOR A REPORT on analyses and characteristics of Alabama coals, field representatives of the U. S. Bureau of Mines have taken 376 coal samples from 79 mines in that state.

FUEL HINT—When you get a cinder in your eye run home and put it in the coal bin.—*Toledo News-Bee.*

Problems of Operating Men

Edited by James T. Beard

Diplomacy vs. Merit as Factors in Promotion

Analysis of the Situation—Causes That Affect Choice Between Two or More Applicants — Causes of Non-promotion — Diplomacy a Controlling Factor

SOME months ago there appeared, in *Coal Age*, a letter by a western writer who deplored the fact that meritorious effort was so frequently unrewarded. I remember the writer claimed that the ability to tell a funny story appeared to be a stronger recommendation in securing promotion, than merit by reason of knowledge and experience.

The statement, I recall, brought forth numerous letters denouncing the charge. My own experience as a miner and mine official, however, inclines me to accept the statement as true, since it agrees with my own conclusions in several instances that have come under my observation. More than once, I have attempted to analyze the situation in hand, with a view to ascertaining the actual cause of the distinction made in the choice between two individuals in line for promotion.

Causes That Contribute to or Hinder Promotion

Investigation showed that promotion is often the result of personal friendship; influence of friends; fellowship in social organizations; peculiar adaptability of the applicant to the purposes of those in authority; and, lastly, the ability of an applicant to "throw the bull," as we say, or impress the employer by the force of his personality.

In contrast with these contributory elements, in the promotion of employees, the following are a few causes of non-promotion: There may exist a personal dislike of the applicant, on the part of the one in authority, who may be jealous of his aspirations, or fear his ascendency, or regard him as too honest for certain hidden purposes of a purely selfish nature.

It will often happen that the failure to secure promotion is due to the individual's relying too firmly on his record, expecting his work to speak for itself. Undoubtedly, this is the case with many of our best workers, who are prone to let their work speak for them, instead of themselves speaking for their work. To boast or even speak of what they have done is contrary to their nature.

In the struggle for ascendency and success in life, there are certain natural or physical elements that are inherent in the individual, such as perseverance, initiative, aggressiveness and personality, all of which are capable of growth and development. Another faculty with which men are unequally endowed is the quality of being tactful or diplomatic.

Analyzing the Situation

This last named quality can only be developed by a close study of human nature with all its conditions and environments. A man may have a complete knowledge of the principles of coal mining, gained through study and practical experience; but his success as a foreman will depend, primarily, on his being able to handle the men in his charge, with tact and diplomacy, without which he cannot hope to gain their confidence and respect.

Now, if this brief analysis is correct, we must naturally infer that the qualities to be cultivated, in seeking advancement, must include the ability to be diplomatic. Proof of this quality, however, is only to be had in the practical test.

The exercise of diplomacy is as important in a mine foreman's relation to and contact with his employers as with his men. If tact fails in dealing with his men, the foreman can still resort to more urgent measures; but strong-arm methods are futile in respect to his superiors, whose word is power.

Diplomacy Wins the Day Where Lack of Tact Fails

By way of illustration, let me assume that a certain foreman's opinion differs from that of his superintendent in regard to the work in hand. A tactless foreman, with the best intention and the courage of his conviction, may give blunt expression of his ideas in a way that would naturally offend his superior and fail in securing any results.

On the other hand, a tactful foreman will handle the same situation, with a delicacy and a courteous display of appreciation that is akin to flattery and, in nine cases out of ten, the obsequious foreman will win out by virtue of his diplomacy.

In conversation with an operator, in regard to the selection of a mine official, I recently propounded the following: If two men apply to you for an official position—the one simply signifying his willingness to be judged by his work; and the other making a parade of what he has done and stating particularly what he can do under the present conditions, while demanding your judgment on suggestions he throws out—to which of these men would you give the preference, in the absence of other recommendations?

Without hesitating a moment, my friend replied, "To the one who made the display of his capabilities." Now, if this is the attitude of the average coal operator, and my observation inclines me to think that it is, modest worth is irretrievably handicapped in seeking advancement.

Before closing, allow me to suggest that it might not be a bad economic feature, while it would certainly be justice to worthy employees, if large corporations would each employ a man who can be entrusted with the investigation of individual merit, and authorize him to recommend men who are, in his judgment, capable and worthy of promotion.

While the generally accepted doctrine that "a man eventually gets what he deserves" may be right, it is equally true that a man does not always deserve what he gets.

Washington, D. C. GLENN GLOM.

Leaks in the Coal Business

Inefficient management an injustice and loss to the public—Waste in the extraction of coal—Failure to properly clean coal for shipment.

WHEN one considers the injustice and loss sustained by the consuming public, through inefficiency in management and wrong methods of mining and marketing the coal, it is surprising that more notice is not taken in the daily press and other publications, regarding the matter.

It does not require a deep study of the situation to prove the crying need of such a fact-finding commission, as has recently been appointed by the president, to ascertain the facts and recommend what is needful to secure the greatest public good.

There is much for this commission to consider in working out a plan that will give a square deal to all concerned and bring satisfaction and contentment to those who now carry heavy burdens by reason of the conditions that have been allowed to grow and develop without seeming restraint, since the close of the war.

Beginning with the management of coal operations, there is scarcely a doubt that many individuals are now holding office and drawing good pay

whose work is not adequate to the expense of their employment. In fairness to all concerned and especially to the consuming public on whom the burden will eventually rest, all such positions should be eliminated, with the aim of securing the highest possible efficiency in management.

Attention has been drawn by many writers to the great waste prevailing in the extraction of the coal, through the employment of methods not suited to the conditions existing in the seam. It is only necessary to add here that the loss to the coal industry, in this respect, is irretrievable. Thousands of tons of coal are abandoned each year and lost beyond recovery.

Shipping Impure Coal a Handicap

At the present time, the coal industry is experiencing another handicap, one that developed large proportions at the time of the war; namely, the failure to properly clean coal for shipment. The blame for this omission rests partly with the miner who is not careful to separate the slate and bone when loading his coal and, in part, is the fault of the operator. The enforcement of strict regulations and careful supervision will largely overcome this evil.

Many operations are not equipped with suitable means of cleaning the output as it comes from the mine. In many cases, cleaning tables should be installed and the coal freed from its impurities before being loaded for shipment. The transportation of unclean coal means a considerable loss to the consumer, in freight charges, to say nothing of the added loss in heat value.

Inequality of Wages a Cause of Much Dissatisfaction

One cause that cannot fail to receive the attention of the President's fact-finding commission is the existing inequality of wages paid for labor of various kinds, in the mining and handling of the coal. Probably no single cause is responsible for the same amount of dissatisfaction and trouble, as the wage question. When it is considered that two hours of labor a day brings some men, employed in the mine, $17.50, while others laboring eight hours a day receive only $4 for their work, it is evident that some revision of wages is needful.

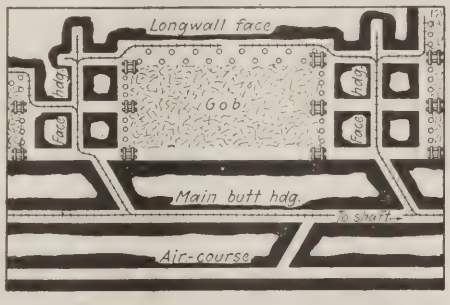
Again, machine men, working in thick seams that often contain much of impurities, are paid the same price per ton, as the men cutting coal in thinner seams. Naturally, work in the thicker seams brings big wages, often far in excess of what the men can earn in cutting low coal. Without doubt there is need here for an equalization of the rate of pay.

To me, a coal miner for more than 33 years, it is evident that this comission must establish a just basis of profits and compensation for labor that will be equally fair to all concerned.

These items and many others of equal import may well receive the careful study of a fact-finding commission. The eliminating of middle-men, in the sale of coal to the individual consumer, will also greatly assist in lowering the ultimate price to the public.

Linton, Ind. W. H. Luxton.

Improved Longwall—Explanation



Face headings dividing panels driven single instead of three abreast—Timbers set as longwall face is advanced to break roof and protect pillar.

In the issue of *Coal Age*, Nov. 9, p. 759, F. C. Cornet has kindly drawn attention to a point that I had failed to make clear in my previous letter (Sept. 21, p. 455).

In that letter commenting on an improved method of working longwall panels, advancing, I proposed driving the face headings separating the panels, single instead of three abreast, as was suggested in the original article by M. L. O'Neale (Vol. 21, p. 877).

As stated in my letter at that time, the scheme suggested by Mr. O'Neale, of driving face headings between the panels and keeping these headings a few yards in advance of the longwall face has unquestionable advantages. My suggestion was to drive these headings single, instead of three abreast, however, and thus save a considerable expense for yardage.

In order to bring the matter more clearly before the reader, I have revised

IMPROVED METHOD OF ADVANCING LONGWALL WORKING

my sketch so as to show the timbers that I intended should be set to break the roof and maintain an air passage between the gob and the coal rib when drawing back the pillars. As shown in the accompanying figure, these breaking timbers are reinforced by cribs built at each crosscut. In my previous letter, I assumed that this was understood to duplicate the method already briefly described by Mr. O'Neale, in his original article.

With this explanation, I think Mr. Cornet and other readers will agree that driving the face headings single is an undoubted advantage over driving them three abreast. Under the light cover assumed by Mr. O'Neale, my plan should present no difficulties in respect to ventilation when drawing back the pillars. Indeed, the conditions are similar, in every respect, to those presented in the original article, except for the driving of a single face heading between panels, instead of three headings abreast of each other.

Linton, Ind. W. H. Luxton.

Competent Machine Runners

Experience needed in running and caring for a coal-cutting machine—Expensive to employ incompetent machine men—Capabilities of men fit them for different work.

Reference made by a writer, in a recent issue of *Coal Age*, regarding the choice of men for particular work, leads me to offer a few remarks relative to the competency and incompetency of machine runners. The employment of competent men to operate coal-cutting machines is an important consideration in any coal company.

An electrician whose duty it is to inspect and keep in repair the coal-cutting machines of a large company has a hard job on his hands unless competent men are employed to operate the machines. An experience of seventeen years in operating and keeping in repair machines of various types and makes, run by all classes of men, convinces me of the importance of employing only men fitted for the work.

What Constitutes a Competent Machine Runner

In my opinion, a competent machine runner is one who has had sufficient experience to enable him to take proper care of the machine in his charge. Many seem to think that competency depends on knowing how to switch on the power for operating the machine. My claim is that it is more important to know when to switch off the power and stop the machine.

An inexperienced, careless operator is a great expense to his company and a handicap in the work of cutting coal. Much damage can be done by the man who does not know or understand when a machine should not be run until some needed repairs have been made. Such a man may cost the company four or five hundred dollars, by reason of his lack of knowledge and experience.

Operating a machine that is in need of some slight repair will often cause damage that will throw the machine idle for several days. The expense of making the repairs is by no means the only item. A far greater loss is the delay in cutting the coal and the consequent reduction in the output from that section of the mine.

Where Does Responsibility Rest?

Who, then, is responsible for the employment of incompetent machine men? It often happens that inexperienced men are employed through relationship, or the close friendship of a mine official; and the company must stand the expense of their incompetency or carelessness in the performance of work. There are mine officials who put the company to needless expense in this manner.

Each and every man in the mine should be chosen with regard to his special capability to perform certain work. Different men are endowed with different capabilities which fit them for different tasks. One writer has referred to the duty of a mine foreman

to select men who are fitted for the work he gives them. It is just as important for a mine electrician to select competent men for cutting the coal. If the electrician is efficient, he will make daily inspections of each machine in the mine. Only in this way will he be in a position to know beforehand what will be needed and to make timely repairs.

Observation shows that comparatively few operators realize the great saving in expense, in the operation and maintenance of coal-cutting machines, by the employment of an efficient and competent electrician charged with the duty of employing competent men to run the machines. Moreover, by his daily inspection of the machines, many delays and much expense will be avoided, which will more than offset the expense of the man's employment.

O. KENNETT.

Hillside, Ky.

Developing Mine Officials

Need of moral and mental development —Strict discipline essential—Only one boss worthy of the name.

THE discussion, in *Coal Age*, of ways and means of developing better mine officials has appealed to me with peculiar interest, inasmuch as I have always been strongly inclined toward the moral and mental development of men who are to supervise and direct the work of their fellows. Moral development is largely the result of a high standard of character and favorable environment. Mental development is only attained by arduous study and application.

What I believe would do more than anything else to develop a higher efficiency, in all classes of mining men, is a higher standard of requirement in regard to mining examinations for certificates of competency. It is my belief that a series of five or six annual examinations would not prove too rigid a requirement, in the granting of mine foremen's certificates.

It is generally agreed that our present mine foremen are not developing into managers as fast as they should. Indeed, the facts seem to prove the truth of the old saying, "Once a Foreman, always a Foreman." This should not be true. Instead, a properly trained foreman should eventually develop into an efficient superintendent and manager.

DEVELOPMENT REQUIRES TRAINING

There is no development possible through an indifferent course of training and a low standard of requirement. Such condition may be the result of a lack of necessary activity on the part of the individual himself or those supervising his work. We often find energetic young men losing their ambition when working under conditions that do not demand the exercise of their best powers.

More than once, I have observed that a *real* boss and disciplinarian is the maker of *real* men. In other words, there is only one boss worthy of the name and he is one who demands respect and enforces discipline. A young man who finds himself working under a laggard would do well to look about him, until he finds a real boss, one who is rigid and severe in his requirements. On finding such a one, the worker can console himself that he is developing into a real man.

In respect to one's own personal efforts in development, there is nothing better that can be said than to quote the old rule of study and application. Solve a problem every day. For myself, I prefer the careful study of the questions and answers found in our coal-mining journals and textbooks. Such a study develops confidence in one's own capabilities.

Pikeville, Ky. GEORGE EDWARDS.

Inquiries Of General Interest

Calculation of Efficiency in Fan Installation

Air Volume and Water Gage Determined by Measurement—Volume of Fan—Volumetric Efficiency—Manometric Efficiency—Power on the Air—Input and Mechanical Efficiency

KINDLY explain the necessary calculations involved in the correct solution of the following problem:

Careful measurement of the air current passing in an airway 11 ft. 4½ in. by 6 ft. 2 in., shows that the air travels at the rate of 1,243 ft. per min. The reading of the water gage at this point in the airway is 0.75 in. The fan producing the circulation is a 10 x 6 ft. double-inlet, Sirocco fan, operated as a blower and run at a speed of 86 r.p.m. The fan is driven by an electric motor belted to the fanwheel. The current is a three-phase system, having a power factor of 0.85, the input to the motor being 42 amp. under a pressure of 440 volts.

It is required to calculate (a) the volumetric efficiency; (b) the manometric efficiency; and (c) the overall efficiency of this installation. I shall greatly appreciate seeing the correct solution of this problem in *Coal Age*.

STUDENT.

Monaville, W. Va.

(a) The first step is to calculate the volume of air in circulation. The sectional area of the airway is $11.375 \times 6\frac{1}{3} = 70.146$ sq.ft.; and the volume of air passing is, therefore, $70.146 \times 1,243 =$ say 87,190 cu.ft. per min.

In order to determine the volumetric efficiency of the fan, it is necessary to first calculate its volume in cubic feet per minute. Running at a speed of 86 r.p.m., a fan 10 ft. in diameter and 6 ft. wide has a volumetric capacity of $6(0.7854 \times 10^2)86 = 40,526.6$ cu.ft. per min. The volumetric efficiency of this fan is, therefore, $(100 \times 40,526.6) \div 87,190 = 215$ per cent.

(b) The manometric efficiency of the fan is the ratio of the actual water gage observed in its operation, to the calculated theoretical water gage. The theoretical water gage of a fan is calculated by dividing the square of the tip speed in feet per second, by 2,233. At a speed of 86 r.p.m., the tip speed of a 10-ft. fan is $86(3,1416 \times 10) \div 60 =$ say 45 ft. per sec. The corresponding theoretical water gage is, therefore, $(45 \times 45) \div 2,233 = 0.906$ in. Finally, the manometric efficiency of this fan is $(100 \times 0.75) \div 0.906 = 82.7$ per cent.

(c) The mechanical overall efficiency is the ratio of the power on the air to the electrical input of the motor. The horsepower on the air is the product of the quantity of air in circulation (cu.ft. per min.) and the unit pressure (lb. per sq.ft.), divided by 33,000, which gives in this case $(87,190 \times 5.2 \times 0.75) \div 33,000 = 10.3$ hp.

Finally, an input of 42 amp. at a pressure of 440 volts is equivalent to $(42 \times 440) \div 746 = 24.77$ hp. For a power factor of 0.85, the effective input is $0.85 \times 24.77 = 21.05$ hp. The overall efficiency is then $(100 \times 10.3) \div 21.05 =$ say 49 per cent nearly.

Standard Wire Gauzes

American standard gauze for safety lamps determined by experiments of Sir Humphry Davy — Experiments of French engineers set up another standard used in some French lamps.

PLEASE explain, through the columns of *Coal Age*, how many openings to the square inch there are in the standard wire gauze used in safety lamps. My understanding has always been that the standard safety-lamp gauze has 784 openings to the square inch of mesh. Recently, some one has told me, or I have seen it stated somewhere, that there are 900 openings to the square inch in standard gauze. I am anxious to know which is correct.

Wheeling, W. Va. S. C. PRITCHARD.

The standard wire gauze used in practically all English and American lamps consists of a mesh of No. 28 B.w.g. steel wires. There are 28 of such wires to the inch, making $28 \times 28 = 784$ openings to the square inch of

mesh. This was adopted as the standard mesh for safety-lamp gauzes, as the result of protracted experiments by Sir Humphry Davy (1815).

Most of the wire gauze, used by safety-lamp manufacturers in this country, has been imported from England. The only other standard wire gauze, as far as our knowledge goes, is that adopted by two eminent French engineers, who investigated the subject in a series of careful experiments. The result was the adoption of a mesh containing 1,264 openings to the square inch, which is now used in some French lamps. We know of no standard safety-lamp gauze containing 900 openings to the square inch, although it is possible that such a gauze is manufactured by some company, today.

Examination Questions Answered

Miscellaneous Examination Questions

(Answered by Request)

QUESTION—*Name the non-explosive gases found in lignite coal mines. Where are these gases found and how are they produced; what are their effects on health and combustion; and what is the most effective means of removing them?*

ANSWER—The gases generated in a lignite mine do not necessarily differ from those in bituminous mines. The non-explosive or extinctive gases found in coal mines are carbon dioxide (CO_2) and nitrogen (N_2). Carbon dioxide is found in poorly ventilated places and wherever combustion, in any form, is going on in the mine. It is produced by the explosion of powder, burning of lamps, breathing of men and animals and the slow combustion of coal in the gob.

Nitrogen is to be found in poorly ventilated places and is produced as the result of the depletion of the oxygen of the air through insufficient ventilation, the oxygen being absorbed by the coal or consumed by some form of combustion taking place in the mine.

The effect of these two gases on health is to produce headache, nausea, and final suffocation by excluding the oxygen of the air from the lungs, if the gas is present in sufficient quantity. Both of the gases being extinctive have the effect to dim or extinguish the flame of a lamp and retard combustion in any form.

The most effective means of removing these gases from the mine is to provide an ample circulation of air, sufficient to sweep them from their lurking places and carry them out of the mine.

QUESTION—*A shaft bottom* 18 *ft. wide and* 250 *ft. long is timbered with* 14 *x* 14 *in. cross-timbers, placed on* 2*-ft. centers. The roof is badly broken and there is a great deal of weight on the timbers, some of which are badly decayed. Describe in detail how you would direct the work of replacing these timbers, at the least expense, yet insuring the safety of the workmen.*

ANSWER—The timbers being 14 x 14 in. in section and placed 2 ft. apart, center to center, there is but 24 — 14 = 10 in. between the timber frames. It may be possible to wedge over one timber set four or five inches to make room for a new set of timbers to be put in place. If this can be done, the old set should then be removed, taking due precaution to avoid disturbing the loose material any more than necessary. There should now be room for standing another new timber set, before drawing a second set of old timbers.

If it is not possible to wedge over one of the old sets of timbers, as just mentioned, the work of standing the new timbers must be started at one end, or at some point where it is comparatively safe to remove an old set. It will be safer and often cheaper to stand a set of temporary timbers of smaller diameter between the old ones, supporting the collar or cross-beam by center posts, in order to hold the loose material in place while replacing the old set with a new timber frame. Such temporary sets must be set before withdrawing the old timbers.

QUESTION—*A slope is* 5,800 *ft. deep, dipping* 25 *per cent. The cable in use is a six-strand, nineteen-wire, steel cable,* $1\frac{3}{8}$ *in. in diameter. (a) What is the breaking strain on the cable when the load is at the bottom of the slope? (b) What safe load will this cable hoist on the given incline, allowing* 30 *lb. per ton of moving load for frictional resistance?*

ANSWER—(a) The breaking strain of a six-strand, nineteen-wire, steel hoisting rope, 1 in. in diameter is 34 tons. Then, since the strength of wire rope varies as the square of the diameter, the breaking strain of a similar rope $1\frac{3}{8}$ in. in diameter is $S = 34(1\frac{3}{8})^2 = 64.28$ tons.

The breaking strain of the rope is the same regardless of the position of the load on the incline. The safe working load, however, must be estimated when the load is at the foot of the incline, in order to make due allowance for the weight of the rope itself.

(b) The safe working strength of a steel hoisting rope may be taken, under ordinary conditions, as one-fifth of its breaking strain; or, in this case, $\frac{1}{5}(64.28 \times 2{,}000) = 25{,}712$ lb.

In estimating the total safe load including the weight of the rope, both the grade and track resistances must be taken into account. An allowance of 20 lb. per ton, for each per cent grade, makes the grade resistance $20 \times 25 = 500$ lb. per ton. To this, must be added the track resistance of 30 lb. per ton. The total resistance is, therefore, approximately, 530 lb., per ton of moving load. The total safe load, including the weight of the rope, then, is $25{,}712 \div 530 = 48.5$ tons.

A $1\frac{3}{8}$-in. wire rope weighs 3 lb. per running foot, which makes the total weight of this rope lying on the incline $(3 \times 5{,}800) \div 2{,}000 = 8.7$ tons. The net load hoisted is, therefore, 48.5 — 8.7 = say 40 tons.

QUESTION—*A slope mine has two intakes and one main return; where would be the best place to install a booster fan and how can I prove whether the return airway will be large enough to carry the increased quantity of air, before installing the booster?*

ANSWER—This is a fool question. Judging from the brief description given, the best place to install the booster would be on the junk heap. Better results in ventilation may be expected, in general, if the mine had one intake and two return airways. A single return airway would need to have a large sectional area to carry the air of two main intakes. Except under special conditions, a booster fan has no place in a mine.

QUESTION—*A shaft* 250 *ft. deep has been sunk to a gaseous coal seam. From the foot of the shaft, the main heading runs to the dip. This heading has been driven* 200 *ft. in advance of the last cut-through, where the entry is dipping* 14 *per cent. How and where would you test for firedamp; or where would you expect to find the gas in largest quantity?*

ANSWER—The question gives no information regarding the character of the workings. It is natural to assume that the gas, in this case, is generated at the face of the dip workings and, mixing with the air current, is carried by the return airway to the foot of the upcast shaft where it passes out of the mine. If the circulation is insufficient to properly ventilate the workings, a firedamp mixture will accumulate in cavities of the roof and in any void places in the workings. All such places should be carefully tested in the expectation of finding gas accumulated therein. Tests for gas must be made at the roof of all entries and rooms and in all live workings that are being driven to the rise.

QUESTION—*A pump discharges* 340 *gallons of water per minute and has a capacity of* 3.4 *gal. per stroke; how many revolutions per minute will a single-acting pump have to make, under these conditions?*

ANSWER—A single-acting pump discharges only on each alternate stroke, or but once during a revolution. Therefore, the speed of the pump in this case is $340 \div 3.4 = 100$ r.p.m.

Spens Outlines Work as Federal Fuel Distributor in Report Accompanying His Resignation

In formally transmitting to the President his resignation as Federal Fuel Distributor, which became effective Jan. 1, C. E. Spens presented a brief report on the work of the emergency office, which was established Sept. 22, after the conclusion of the coal strikes.

F. R. Wadleigh has been designated by the President to succeed C. E. Spens as federal fuel distributor. Mr. Wadleigh has been chief lieutenant to Mr. Spens throughout Mr. Spens' administration. He also is continuing to fill the position of chief of the coal commodity division of the Department of Commerce.

"On account of the greatly decreased production of coal, due to the miners' strike, which lasted approximately five months," says the report, "our first act was to apprise the public of conditions and to urge upon consumers—industrial and domestic—to confine their purchases to current requirements, that there might be no distress, until such time as increased production would permit of reserves. An inquiry also was directed to the Governors of all the states as to their local conditions and to ascertain whether or not federal assistance was necessary or desired. The replies indicated there was little, if any, cause for anxiety in any of the states west of the Mississippi River, excepting as to Minnesota, North Dakota and South Dakota. In most of the territory east of the Mississippi River the situation appeared to be quite serious.

Two Advisory Committees Appointed

"Two committees were appointed to assist the Federal Fuel Distributor—one designated as the Advisory Committee on Industry and the other as Advisory Committee on Transportation.

"On Sept. 27, regulations were issued and served on all coal producers, providing for daily information as to shipments and prices charged on each class of coal shipped. These regulations, due to the improved conditions, were withdrawn on Dec. 1.

"At a conference on Oct. 5 with the Advisory Committee on Transportation, specific recommendations were agreed upon and issued by that committee to all carriers as to the different requirements necessary to meet the situation. These recommendations contemplated, among other things, that all railroad material, including railroad fuel in coal cars, was to be promptly unloaded; that all maintenance and construction work requiring use of power and cars should be discontinued in so far as practicable, that this equipment might be turned into commercial service; that a vigorous campaign should be inaugurated to reduce to a minimum the number of locomotives and cars awaiting repairs, and that there should be an organized effort to check delays in transit or at terminals of cars loaded with coal as well as empty coal cars returning to the mines.

"There has been a continuous decline in the percentage of cars in bad order—the reduction from Sept. 1 to Dec. 1 being 4.3 per cent.

"Production is now approximately 11,000,000 tons per week, although during November in particular, there was an unusually large number of holidays at the mines.

"It is estimated that the current consumption is from 8,500,000 to 9,000,000 tons per week. A census taken at our direction by the U. S. Geological Survey and the Census Bureau, Department of Commerce, indicated that the amount of bituminous coal in storage on Sept. 1 was 22,000,000, which had increased to 28,000,000 on Oct. 1, and our best estimate is that on Nov. 1 the amount had grown to 35,000,000 tons and at least to 40,000,000 by Dec. 1.

"That the carriers co-operated to the fullest extent is evidenced by the increased production, when consideration is given to the fact that they themselves were still suffering from the ravages of the shopmen's strike, and the further fact that during this period offerings of tonnage of all character were extremely large. A glance at the following figures, which represent the number of carloads of revenue freight loaded for each week specified, during this fall, as compared with similar periods in 1921 and 1920, show that the total loading in 1922 was considerably in excess of that for 1921, and, in a number of instances, greater in 1922 than in 1920. The week ended Oct. 14, 1920, was the heaviest week in the history of the railroads, viz.: 1,018,539 carloads, but for the week ended Oct. 28, 1922, the loading was 1,014,480 carloads, or only about 4,000 cars less than the 'peak' week:

Week Ending	1922	1921	1920
September 16	945,919	852,552	991,166
September 23	973,291	873,641	1,008,109
September 30	988,381	904,831	992,283
October 7	968,169	899,681	1,011,666
October 14	983,470	910,529	1,018,539
October 21	1,003,759	964,811	1,008,818
October 28	1,014,480	951,384	981,242
November 4	994,827	837,576	915,615
November 11	953,909	755,777	927,586
November 18	969,094	790,363	889,138
November 25	955,495	673,465	803,701
December 2	845,219	741,849	882,604

"The bituminous production in 1921 was 415,000,000 tons. The production in 1922 up to and including Dec. 16 was 387,152,040 tons, so that the production during 1922 will nearly equal that in 1921, despite the strike this year that lasted nearly five months.

"As to priorities in transportation, as contemplated in the act, the instances where we have recommended issue of individual priorities have been comparatively few. Where applications for priorities have been received, we have endeavored to take care of such instances by increased car supply and by co-operation with shippers. Individual priorities are undesirable, creating as they usually do, discriminations and often merely resulting in the transfer of cause for similar applications to other localities.

"In the matter of prices on bituminous coal, practically all complaints received have been confined to prepared sizes for household use, and in consequence our efforts as to prices have been largely confined to domestic coals.

"Numerous conferences were held with the operators in the various districts with the following results: In the Pocahontas district, New River district, Tug River and Winding Gulf districts of West Virginia the operators voluntarily expressed a willingness to maintain a maximum price, f.o.b. mines, that constituted a reduction in the previous maximum price of approximately $3 per ton; in Alabama, $1 per ton; in the Pittsburgh (Pa.) district, $1.50 per ton; southern districts of Ohio, $2.25 per ton; in Pittsburgh No. 8 Ohio district, $1.50 per ton; in the Fairmont (W. Va.) district, $1.25 per ton; and in the Fifth and Ninth districts in Illinois, $1 per ton. The reductions in these districts automatically resulted in similar reductions in competitive fields, and in other districts increased production has had a similar effect.

"We have in no instance attempted arbitrarily to fix specific prices, all the reductions referred to having been made voluntarily by the operators, at our instance and request.

"The following figures, taken from *Coal Age*, give a comparison of the weekly average spot prices of bituminous coal, f.o.b. mines, for the week ended Sept. 11 up to and including the week ended Dec. 11, as compared with the months of September, October and November, 1920. Production and demand in 1920 were abnormally large:

WEEKLY		WEEKLY	
September 5	$5.08	November 20	$4.15
September 11	5.17	November 27	3.99
September 18	4.99	December 4	3.95
September 25	5.06	December 11	4.07
October 2	4.89		
October 9	4.60	MONTHLY	
October 16	4.45		1920
October 23	4.26	September	$8.52
October 30	4.19	October	7.78
November 6	4.16	November	5.87
November 13	4.12	December	4.38

"In the matter of bituminous coal loaded into vessels at

Lake Erie ports, this season's tonnage of cargo coal amounted to 18,501,055 tons; in 1921, 22,412,380 tons; in 1920, 22,408,355 tons. In addition, the amount of bituminous coal on hand on commercial docks at Upper Lake Ports (Lake Superior and Lake Michigan, not including Chicago) was 4,300,744 tons on April 1, 1922; 2,053,022 tons on April 1, 1921, and 860,521 tons on April 1, 1920. There were about 2,000,000 tons more of bituminous coal on hand on these commercial docks on April 1, 1922, than on April 1, 1921, and more than 3,000,000 in excess of that on hand April 1, 1920.

"Due to the miners' strike the shipment of lake coal was necessarily largely concentrated within the period Sept. 11 to Dec. 1. During the twelve weeks ended with Dec. 4, this year, the average weekly loading into vessels amounted to 1,012,664 at Lake Erie ports as compared with an average weekly loading of 477,945 tons for the same period in 1921.

"The movement of soft coal from Illinois and Indiana and other districts this season also has been far in excess of that during last year, so that the northern districts served principally by the lakes are in a satisfactory condition in so far as bituminous coal is concerned. The distribution of 'lake' coal as between the various ports this season has followed very closely the percentage distribution that obtained during the previous years.

"Due to the miners' strike, it has been estimated that the production of anthracite this season—that is, from the date the strike ended, Sept. 11, up to April 1, 1923—will not exceed 60 per cent of last year's production, and the plan of distribution of this season's production contemplates a prorata distribution among last year's consuming communities. The following figures indicate the trend of weekly production since the week ended with Sept. 9 as compared with similar period in 1921:

	1922	1921
September 9	50,000	1,483,000
September 16	1,107,000	1,749,000
September 23	1,863,000	1,725,000
September 30	1,947,000	1,802,000
October 7	1,959,000	1,764,000
October 14	2,075,000	1,813,000
October 21	2,003,000	1,910,000
October 28	1,804,000	1,751,000
November 4	1,839,000	1,689,000
November 11	1,863,000	1,350,000
November 18	2,191,000	1,879,000
November 25	2,174,000	1,650,000
December 2	1,819,000	1,815,000
December 9	2,038,000	1,675,000
December 16	2,200,000	1,637,000

"In terms of cars, the loading this season as compared with 1921 and 1920, is as follows:

	1920	1921	1922
Average daily loading October	5,910	5,853	6,049
Average daily loading, November	5,447	5,327	5,919

"Up to and including the 19th of this month, the average daily loading for December, 1922, was 6,196 cars.

"The lake anthracite program contemplated a movement of about 2,000,000 tons. Lake navigation closed with approximately a movement of only 1,250,000 tons, a shortage in this program of 750,000 tons, which deficit, it is planned, will be equalized by all-rail movement, and which movement is now under way.

"Canada's current allotment of 1,300,000 tons would represent about 4 per cent of the total production. During the calendar year 1921 the total shipments of domestic anthracite amounted to 51,916,578 tons, of which Canada received 3,920,000 tons, or 7.55 per cent.

"In the matter of prices on anthracite, the Commonwealth of Pennsylvania appointed a Fair Practices Committee, reporting to the Pennsylvania Fuel Commission, to fix maximum prices, f.o.b. at the mines. This committee has practically completed its work; prices on approximately 99 per cent of the production have been established, which maximum prices range from $8.50 to $12 per ton, dependent upon cost of production.

"Throughout our service we have enjoyed the most sincere co-operation on the part of the Interstate Commerce Commission, State Fuel Administrators, railroads and also a large majority of the coal operators. In no instance have we found it necessary to invoke the penalties provided in the act.

"The bituminous situation generally is in good shape. Complaints continue of shortage in car supply, but there are few complaints of current shortage of bituminous coal. There is, however, a demand by industry, particularly public service corporations, in certain sections, for greater opportunity to increase reserves, due to a large extent to anticipated possible renewal of labor troubles this coming spring.

"With the seasonal reduction in other traffic, which this year, however, has been greatly retarded, additional power should be released for the transportation of coal, and while this power generally is not yet up to standard due to the shopmen's strike, barring extreme weather, which, of course, would further affect the railroads' capacity, we are hopeful that the situation may be cared for without serious distress. Difficult weather might result quite seriously.

"The clamor for anthracite is quite urgent. We have repeatedly advised the public of the situation with regard to this commodity, that they might provide themselves, to some extent, with substitutes. The current production is, however, so satisfactory that, barring unexpected difficulties, we believe the available supply will somewhat exceed the earlier expectations.

"Of the amount appropriated by Congress for the purpose of this act, approximately $40,000 will have been expended for the period Sept. 22, the date the law became effective, until Jan. 1, 1923."

Operators Within Rights in Draining Mine Water Into Indian Creek, Judge Holds

In an opinion covering nearly 100 typewritten pages handed down last week Judge J. Q. Swearingen, in the Common Pleas Court of Fayette County, Pennsylvania, denied an injunction sought by the Mountain Water Supply Co., the Dunbar Water Co. and the Pennsylvania Railroad Co. to restrain twenty-nine coal operators in the Indian Creek Valley from draining sulphuric acid-laden water into Indian Creek, thereby contaminating the water supply of the plaintiff companies.

The court held that the mine owners could permit the water from mines to flow by gravity into Indian Creek when that stream provided the natural drainage for the watershed and that it is incumbent upon the water companies to receive the water as it flows into the creek and into the storage reservoir of the plaintiffs and purify it for whatever use it is intended.

The decision is the conclusion of the first phase of the battle between the Pennsylvania Railroad Co. and its subsidiary water companies on one side and the coal operators on the other.

The case will be appealed to the higher courts. This has been the understanding from the beginning of the litigation.

Ford Buys Pond Creek Coal Property

The Ford Motor Co. has purchased the coal lands, mining plant and equipment of the Pond Creek Coal Co., situated in Pike County, Kentucky, according to an announcement Dec. 28 by T. B. Davis, president of the latter company. The purchase price was not announced, but Mr. Davis estimated that upon final liquidation the net worth of the present company would approximate $45 a share. There are 212,920 shares of common stock, which would make a valuation of about $9,581,400. The Pond Creek company is a producer of soft coal, in a non-union mining field.

Henry Ford had an option to purchase the Elkhorn coal properties in eastern Kentucky which he failed to exercise. It expired Dec. 22.

Howat Ticket Wins in Kansas

The Howat ticket headed by William Bogartz for president, won in the recent election in District 14, United Mine Workers, the official recount now shows. The new officers have assumed office, thus raising the Howat question formidably again in Kansas. Alexander Howat, now in prison for violating orders of the Kansas Industrial Court, was ousted from the district presidency by the International nearly two years ago for calling an unauthorized strike.

Miners' Nationalization Committee Submits Plan for Public Ownership and Operation of Coal Industry

"A plan of public ownership, public control and democratic management of the coal industry," prepared by the Nationalization Research Committee of the United Mine Workers, was made public Dec. 29 by C. J. Golden, president of District 9 and chairman of the committee, at a dinner of the League for Industrial Democracy, at the Aldine Club, New York City. The miners' union created the Nationalization Research Committee at the international biennial convention of 1921 to study nationalization of mines and the plan is the result of eight months' work by the committee.

The scheme, which is embodied in a brochure entitled "How to Run Coal," placed a valuation on the soft-coal industry—based on operators' and government estimates—of between $1,500,000,000 and $2,000,000,000. This, they pointed out, was a little more than the selling price of soft coal at the mines for 1921.

The estimate of capital investment in the anthracite fields was given as $432,000,000, the federal census figures, and the value of royalty payments on coal in the ground in which operators have made investments was placed at $2,000,000,000. So the miners estimate the total cost of the government taking over the coal fields as $4,500,000,000.

The miners propose as the basis of an organization for operating the mines and fixing prices a Federal Interstate Commission of Mines, at the head of which would be a Secretary of Mines with a place in the Cabinet. This commission would be appointed partly by professional and industrial associations and partly by the President. It would include fact finding, scientific determination of costs, price fixing and other similar duties.

The work of administration, of actual operation, would be done by a National Mining Council, composed of three groups representing the financial, technical and administrative heads of the industry; the miners and the coal consumers. They would be appointed by the federal commission from the nominations made by the groups represented.

Wages would be made a first charge upon the industry, with a national basic wage as a foundation for determination. There would be differentials for risk, skill and local conditions, the determination to be not on "class warfare" but on measurement of skill and efficiency.

The plan frankly states that a political labor party, which would protect the interests of the miners by bringing political influence to bear on government commissions, is essential to the success of the plan, inasmuch as the representatives of the people designated to decide problems of control and expenditure probably would at present be unsympathetic to labor.

The plan, which the committee calls the American plan, has the following preamble of justification:

"The coal industry has been so disorganized and mismanaged that the situation in recent years has approached what big business men and stand-pat Senators describe as a 'catastrophe.' Intelligent men, with the welfare of the industry at heart, agree that the 'game is up'—the old game of speculative profits, overproduction, shortages, sky-high prices, unemployment, gunmen, spies, the murder of miners, a sullen, desperate public. Unless unification and order enter the industry, there will be a blow-up somewhere, followed by drastic, angry and frenzied legislation. The American Kingdom of Coal is today in as chaotic and explosive condition as the States of Europe. No single constructive suggestion has come from the operators. No large leading idea has come from the public. The public is feeling intensely, but is not yet thinking wisely.

"The operators have a fresh explanation for the annual crisis as often as it rolls around. One year it is car shortage, another year, high wages, then the war, then government interference. Of thought-out plan and remedy they have offered none.

"The only large-scale proposal has come from the United Mine Workers of America in their demand for nationalization. It is the only proposal that grapples with slack work for the miners, high prices and irregular supply for the consumers. It is now the job of the miners to decide what kind of nationalization they want. There are only three plans possible for control and administration. All other plans are minor variations on those three. There are only three plans possible, because, after the owners are bought out, only three interests are concerned—the public, the miners and the technical and managerial group. The plans differ in the proportion of power they give to each of the three interests."

Any plan must not only provide a decent American standard of living to the worker, but must satisfy his desire for a voice in the management, said the proposal. Some gains, such as control over the rate of pay, qualifications, hours, inspection and other details, have been won by the union.

"But these gains are not enough for a worker in a democratically managed industry," said the plan. "He wishes the right to make suggestions on technical improvements, on car-pushing, on slack work, on output and the right to take part in carrying them out. There will be no complete co-operation until his suggestions are welcomed and weighed. His good-will and intelligence should be encouraged. They must be incorporated in any successful scheme of administration. The working miner must have a real part in the government of coal. Democratic management is what the worker wants.

"But any plan of nationalization must also include ownership by the public. Ownership of the mines by the miners alone would be as unjust and as disastrous as ownership by the coal operators has proved itelf to be. The public must give the final decision on the large issues of the industry.

Would Separate Control from Administration

"Any plan of nationalization must include the separation of control from administration. The decision of policy is one thing. The job of administration, that is, running the industry, is quite a different thing. To give control to the community as a whole, to safeguard the future as well as the present, to practice the American policy of conservation equally with that of business initiative—all this is in the job of control. Control means to know what is actually being done as well as to know what must be done to get results and to order the thing to be done. Control means statistics of output, requirements, stocks; it means tests, inspections, research, publicity; it means the collection of all the necessary new and now unknown facts about the industry.

"Under public ownership and democratic administration the coal industry will find out how much coal the people want, how much of a supply is already in stock, what is the cost of mining coal, how much pay a miner gets, and what the correct price is for a ton of coal. These are simple, easy, fundamental and essential facts in running an industry. But not one of these elementary facts is known today.

"A permanent fact-finding agency will be one of the instruments of control. Control means a permanent federal interstate commission of mines, and the eyes of the commission will be a fact-finding agency, with uniform accounting and a research group. At the head is the Secretary of Mines, a Cabinet member. This federal commission will be created by Congress and composed of at least eleven members. Five of these members should be named by such bodies as the professional and industrial associations (engineers, &c.). The other six members will be appointed by the President. The functions of this federal commission include fact finding, scientific costing, budget determination, price fixing, research. A scientific budget is essential to the success of this plan."

The Federal Commission on Mines would control the finances of mining under the plan, and the National Mining

Council, representing the operation body, would present to the commission its receipts, expenses, salaries, wages, costs, plans for development and prices.

"Any plan of nationalization must arrange for the determination of price, quality and quantity of output by the whole community, and not by the group, of workers," said the plan. "This means that the Federal Commission on Mines and the Secretary of Mines will have the final say on these matters. That will be the public safeguard."

The Bureau of Wage Measurement would be a part of the federal commission, which will pass upon the findings of the bureau "from the point of view of business expediency and economic feasibility. The Bureau of Wage Measurement will deal scientifically with the disputed points in rate fixing, such as dead work, for which no satisfactory standardized rate has been worked out.

"Wages will be made the first charge against the industry. A good American life for the miner will be regarded as of equal importance with a steady supply of coal at a reasonable price to the public. For the first time in the history of the industry, disputed wage questions will be removed from the administration of the industry, where they do not belong, and placed under the economic control of the industry, where they do belong. The mine manager will be able to turn his face away from the business office and direct his full attention to the getting out of coal. In the past the 'good' manager has too often been forced to be a labor 'squeezer,' cutting rates to prove his efficiency. The good manager of the future will be ranked by his skill in coal production and in the sound organization of work. Administrators, instead of wage haggling and market juggling, will administer."

Plan Would Maintain Collective Bargaining

The principle of collective bargaining would be maintained under the nationalization plan, which holds that the union must be safeguarded as much as under private ownership.

"The United Mine Workers of America under nationalization will not only participate in administration, but must in addition maintain its own life and integrity as 'an independent organization of initiative and defense,'" says the statement. "It must be in a position to discuss wages through the Wage Scale Committee, an independent joint conference board. This is the same right which workers under consumers' co-operation enjoy."

This was in substance the outline of the plan for nationalization as put forward by the miners. It was given "not as a final plan but as something round which the miners may build their own program and as a focus for the thinking of the public." It pointed out that "the coal industry is so dependent on transportation that the miners' program is one with the program of the railroad workers for nationalization of the railroads."

Joined to the plan was a second section, entitled "A Warning," which contained the miners' reasons for putting forward their plan. It said:

"The present private control of coal is doomed. Plans for reorganization are already being pushed by the press, President Underwood of the Erie Railroad and many others. This is a dangerous time for miners. The miners must do their own thinking and do it quickly. They must beware of specious plans in place of sound plans. When the miners offered to the House Committee the suggestion for an emergency investigating commission with a joint representation of the industry, miners and operators, the operators responded with a substitute—a commission from which miners were barred. When the miners urged a federal fact-finding agency, permanent and compulsory, the business interests answered with various schemes for governmental regulation, or for trustification.

"The conditions of success for nationalization are these:

"1. Administrative organizing minds in the public service.

"2. A competent technical staff.

"3. A 100 per cent organized union.

"4. Collective bargaining publicity accepted as the basis of wage agreements.

"5. A large labor representation in all departments of government.

"6. A political labor party.

"Confiscation, in any form, is of course unthinkable. All those holding an investment in mines, equipment, and coal beds will be recompensed at a just figure. The first steps will be taken by the Federal Fact-Finding Agency, the Bureau of Statistics, in listing the plants, and in making a list of the owners of the coal beds. That register is an immediate need, regardless of nationalization. Then follows the task of a valuation of the coal beds. The government has used up several years in valuing railroad properties. We suggest as the principle for appraising the value of coal the principle of established expectations. This means that the nation buys up the established expectations of the owners of the coal beds. It gives compensation for the disturbance of established expectations of being able to draw an income. With established expectations as the principle of purchase, the work of valuating is simplified.

"For the British coal industry, it was estimated by Sidney Webb that between two and three hundred million pounds would meet all demands. That would be from a billion to a billion and a half dollars. This estimate included coal and collieries, royalties, and every form of stock holding.

"Four and a half billion dollars for the coal industry and the coal of the United States is a liberal estimate."

Analysis of Railroad Performance Expected To Result in More Efficient Service

Railroad performance in the handling of coal since the close of the strike has been studied and analyzed more carefully than ever before. The conclusions which are being reached do not reflect credit on the railroads. When the figures are all compiled, it is believed they will prove conclusively that railroading efficiency is very low.

These figures also will show, it is believed, that in addition to the poor handling of cars the principal causes of transportation deficiencies will be found in the lack of motive power and in the inadequacy of terminal facilities. The railroads have enough open-top cars actually engaged in the transportation of coal to move the entire requirements of the country if each car will average thirteen trips a year. It is believed that even a better movement is within the range of good management. At present the average railroad car in service is twenty days under load and 2.2 days in movement, but it is earning revenue during only 1.5 days.

This year's careful scrutiny of transportation conditions will develop, it is believed, that bottle-neck and expensive terminals must give way to expanded facilities and the sale of high-priced, close-in terminals. In many cities the land occupied by terminals can be sold for very high prices. Terminals can be located on cheap outlying land with better facilities for the spotting of cars where they are available to motor trucks.

I. C. C. Issues Service Order 32

Service Order No. 32 has been issued by the Interstate Commerce Commission to insure further supplies of coal for the Government Fuel Yard at Washington. The Chesapeake & Ohio R.R. has been ordered to assign cars at the rate of five per day for ten consecutive working days to the mine of the E. E. White Coal Co. at Glen White, W. Va.; to the mine of the same company at Stotesbury, W. Va.; to the mine of the East Gulf Coal Co., at Helen, W. Va., and to the mine of the White Oak Coal Co., at Sprague, W. Va.

The Pennsylvania R.R. is instructed to assign five cars per day for five consecutive working days to the Arrow No. 5 mine of the Arrow Coal Mining Co. at Reitz, Pa.; six cars per day for ten consecutive working days to the mine of the Emerson & Morgan Coal Mining Corporation at Hagevo, Pa.

The Baltimore & Ohio R.R. has been directed to assign two cars per day for ten consecutive working days to the Big Chief Mine of the Sagamore Coal Co., Indian Head, Pa., on the Indian Creek Valley R.R.

Publication of Facts as Obtained by Coal Commission An Important Work in Public Education

By Paul Wooton
Washington Correspondent of *Coal Age*

While it is confidently expected that the President's Coal Commission will make available considerable quantities of facts which may be used in the wage negotiations, it is pointed out that the Jan. 15 report need not be the only revelation of facts which can be used by the wage-scale committees.

Both operators and mine workers apparently have been convinced that the commission does not expect to undertake mediation. Since the entire responsibility in the negotiation of wages is left to those immediately concerned, those who are engaged in the task, many believe, have a right to expect such assistance as the commission can give by making available in installments such facts as the commission is gathering. The situation is one which needs all the light that can be thrown on it.

In addition to contributing authoritative data to those conducting the wage conferences, the success of the commission's work depends to a great extent on the public support which may be given to its recommendations. If the commission withholds its facts and submits ultimately a long and voluminous report, the public will not be inclined to attempt to digest it. In the opinion of those who are particularly anxious to see the commission accomplish the maximum of good, the data on which its conclusions will be based should be submitted to the public piece by piece as fast as it comes to hand. Facts presented in this interim manner will be published widely and will be assimilated by the public. It will not only give Congress the benefit of the opinion which the public thus will form and make known but it will do an important work in public education. As it is, the public is surprisingly ignorant of the workings of the coal industry. So much of its prosperity depends on the proper functioning of the coal business that anything which makes it possible for the people to grasp the problems more knowingly, will do a service to the nation.

Insufficient Cost Forms Supplied

Regardless of who may be to blame, a bad psychological effect has been created among the operators because sufficient cost forms were not immediately available. It has been difficult for the leaders among the operators to engender any great amount of enthusiasm among their associates in the matter of submitting this cost information. It has had the tendency to slow up the work at a time when basic information of this character is essential to the commission's progress.

Published statements to the effect that there is friction among the members of the Coal Commission and that the President may be called upon to decide between the disputants were denied categorically by Chairman Hammond on Dec. 30. He characterized the statements as "imagination" and "romance." He declared that while there are frequent occasions where the opinions of the members of the commission do not coincide, there never has been a single discussion where even a semblance of heat was developed. As a matter of fact, Mr. Hammond stated, the discussions of the commission have been particularly free from anything other than the most friendly and earnest exchanges of views.

It has been stated that "one portion of the commission wants to abandon the questionnaire method." No such thought ever has been entertained, Mr. Hammond declared. The commission is unanimous in its belief that it must make use of the questionnaire method, as it is obviously impossible for comprehensive facts and figures to be gathered in a short time by any other means. He said the commission had been assured by members of Congress that it can get all the authority it needs to gather any information which is germane to the inquiry.

Chairman Hammond revealed at the Dec. 30 conference with the newspaper correspondents that thought is being given by the railroads and by the operators to reductions in freight rates and in the price of coal, respectively, during certain months with the idea of decreasing the seasonal character of the coal movement.

Professor Stoek, University of Illinois, the recognized authority on storage of bituminous coal, whose services as a consulting engineer in the U. S. Bureau of Mines are being utilized by the Coal Commission, was in Washington last week and was called into conference by the commission. He convinced the commission, it is reported, that the storage of bituminous coal is entirely practicable and that the danger of spontaneous combustion has been greatly exaggerated.

The Coal Commission's report to Congress of Jan. 15, according to definite statements of Mr. Hammond on Dec. 30, will not take up the questions of transportation, car shortage or the labor situation. He further indicated that the report will be final as far as it goes and that there will be no tentative discussion. It will contain facts on the coal industry, such facts as have been assembled so far by the staff of the commission.

The Jan. 15 report is but the forerunner of a series of statements that will be published by the commission. As an investigation is completed, results will be given to the public. Suggestions for legislation affecting the coal industry called for by the act creating the commission will not, however, be formulated prior to the final report of the commission next September.

Commerce Commission to Investigate Car And Motive-Power Equipment of Roads

The Interstate Commerce Commission began Dec. 7 a general investigation, under docket 14,489, of the adequacy of the car and motive-power supply of railroads and into the practices prevailing with respect to the interchange of cars. The inquiry has been instituted "with a view to promoting economical and efficient service, to prescribing and establishing such just and reasonable rules, regulations and practices with respect to car service, and to require the respondents to provide themselves with such safe and adequate locomotives and cars wherewith to perform as common carriers their car service as may upon such investigation appear to be contemplated and required by law." As a preliminary step the commission has by questionnaires called upon the carriers for the following information:

(a) Freight train cars owned or leased at the beginning and close of year 1922, and number ordered but not delivered Dec. 31, 1922.

(b) Estimated number of additional cars needed by classes, estimated cost thereof, proposed program for acquiring such cars and proposed plan of financing.

(c) Ages of cars in service by classes, Dec. 31, 1922, 100,000 lb. capacity and over.

(d) Ages of cars in service, 80,000 lb. and less than 100,000 lb. capacity.

(e) Ages of cars in service, 60,000 lb. and less than 80,000 capacity.

(f) Ages of cars in service less than 60,000 lb. capacity.

(g) Locomotives owned or leased at the beginning and close of year 1922 and number ordered but not delivered on Dec. 31, 1922.

(h) Unserviceable locomotives on line first of each month in 1922, by classes, and tractive power.

(i) Ages of locomotives at close of year 1922, by classes —freight, passenger, switch.

(j) Estimated number of additional locomotives needed,

proposed program for acquiring such equipment and proposed plan of financing the purchase thereof.

(k) Commodities loaded monthly, 1922, revenue freight—carloads.

(l) Carloads of non-revenue freight loaded monthly 1922.

(m) Freight cars on line daily, serviceable and unserviceable, by months in 1922, box, coal.

(n) Freight cars on line daily, serviceable and unserviceable, by months in 1922, refrigerator, flat.

(o) Freight cars on line daily, serviceable and unserviceable, by months in 1922, stock, all freight.

(p) Freight-car surplusages, daily averages by months, 1922, railroad owned cars.

(q) Freight-car shortages, daily averages by months, 1922, railroad owned cars.

(r) Freight-car surplusages, daily average by months, 1922, cars owned by private companies.

A questionnaire also has been directed to all private car lines requesting information concerning fraight-train cars owned or leased by them, and the number of such cars ordered, but not received.

All carriers by railroad subject to the interstate commerce act are made respondents. The Governor of each state, as well as the tribunal thereof, if any, having regulatory powers over the common carriers by railroad, have been notified of this proceeding. The times and places for hearings will be announced later.

Creation of Coal Commission Unanimously Approved, Council of Churches Finds

As the result of an inquiry conducted by the research department of the Federal Council of Churches during the last few weeks into the public attitude toward regulation of the coal industry, the council has made public its conclusions, based on interviews and detailed replies to specific questions received from employers, labor representatives, technicians, editors, educators and church leaders in various parts of the country, summarized as follows:

"(1) The demand for a full and authoritative statement of the facts is almost a wail. There is apparently unanimous approval of the government's action in creating the present commission. Even persons generally well informed who have lost no opportunity to read and observe, use such expressions as these: 'I am in a mist of perplexity'; 'There is so much doctored publicity'; 'The public finds itself quite without any dependable information'; 'No intelligent public opinion'; 'Complete lack of reliable information.' The editor of a great metropolitan paper which has given much space to the coal controversy complains that 'none of us has sufficient data yet on which to formulate a policy.' One of the ablest members of the American Federation of Labor executive committee writes: 'If there is any one thing in connection with the coal situation which impresses the thinking man, it is the absence of reliable and adequate knowledge.' Manifestly if the Coal Commission should not fill this need it would be distinctly disappointing to the general public.

"(2) Fear is expressed lest the commission may not pursue its inquiry to the full extent of the powers given it by Congress; that, specifically, it will not secure the facts concerning investment and profits. The law obviously contemplates that the commission shall utilize the data in the hands of the Federal Trade Commission and the Bureau of Internal Revenue and shall supplement this as necessary by direct testimony. It is likewise apparent that if the question of the relation of civil liberties to the control of the mining industry, with particular reference to portions of Pennsylvania and West Virginia, is not fully canvassed by the commission, there will be much dissatisfaction with its findings of fact. The public is apparently well aware now that the crux of this whole matter, in so far as the labor controversy is concerned, is the question whether the miners are to be allowed to unionize or are to be permanently arrayed against each other in competing union and non-union fields. Some persons recommend the latter alternative as a matter of public policy; others see justice only in the former.

"(3) There is a remarkably widespread conviction that what is wrong with the industry goes far deeper than those natural periodic conflicts of interest over wages and hours which arbitration might adjust. It seems to be generally recognized that because of overdevelopment and seasonal demand in the soft-coal industry some form of government regulation is necessary.

"(4) The replies indicate no organized public opinion in favor of government ownership or of full government control of the mines. It is felt, rightly or wrongly, that federal operation of the railroads was accompanied by waste and inefficiency, and that industrial progress in general demands as little federal interference as possible. There has been much talk of nationalization among the miners themselves, but official spokesmen for labor are by no means of one mind on the subject. There is on all hands fear that the machinery of government control would fall under political domination. Yet the coal situation so clearly constitutes an emergency that many people are thinking in terms of regulation through one or more federal agencies. The suggestions are for the most part not developed in detail, but the analogy of railroad regulation through the Interstate Commerce Commission has apparently impressed many people as instructive in this connection. Further, it appears likely that if the threatened strike takes place next spring, there will be a general demand for drastic action. 'I am against nationalization of any industry,' writes a well-known conservative editor, but adds that 'it may be that nationalization is the only cure for the troubles of the coal industry, and if the present commission so reports, I should certainly be inclined to a favorable consideration of its recommendation.'"

Berwind-White Mine Workers Worse Off Than Slaves, Says Report of Investigators

Miners employed in the Berwind-White Coal Co.'s mines have to endure living and working conditions "worse than the conditions of the slaves prior to the Civil War" according to the report of the committee appointed by Mayor Hylan, of New York City, to investigate labor conditions in the Berwind coal mines in Somerset and other counties of Pennsylvania which supply the Interborough Rapid Transit Co. with coal. This report, made public Jan. 1 by David Hirshfield, Commissioner of Accounts of New York City and chairman of the committee, urged that the government take over the coal fields and operate them for the "benefit of the people and place it beyond the possibility of any men or group of men to restrict coal production or its distribution."

The committee declared that E. J. Berwind, president of the Berwind-White company, as chairman of the Board of Directors of the Interborough, controlled the coal-supply policy of the transit company, which had made it possible for him "to purchase from his own company coal mined under unfair and heartbreaking conditions and reap therefrom enormous profits, amounting in 1921 to over $1,600,000, with corresponding financial detriment to the tax and rent payers in the City of New York."

Agreement on Four-State Wage Negotiation Expected in Chicago in Three Days

Chicago, Jan. 2.—Western operators were optimistic before the opening of the miner-operator conference in Chicago Wednesday that within three days both sides would have agreed to four-state negotiation with the idea of continuing the present wage scale one year. The possibility of an "unholy alliance" between operators of the outlying districts and the miners, on the ground that the miners would oppose the one-year plan and because the outliers would be bankrupted by a continuance of the present high wages was scouted by the best observers. Instead it was generally prophesied that a quick agreement upon four-state negotiation would be made and then that outlying districts would struggle in the negotiations for a variation in their scales so that they might meet non-union competition in 1923. The sub-committee on methods was scheduled to meet an hour before the main conference.

Hammond Appeal Urges Operators and Mine Workers At Chicago to Agree on Wage-Making Machinery

John Hays Hammond, chairman of the President's Coal Commission, addressed an appeal on Jan. 2 to the operators and mine workers assembled in Chicago to set up the machinery for wage-scale negotiations. In effect, he points out that the coal-consuming public is tired of living under the existing armistice between the operators and the mine workers. It wants peace. The inference of the appeal is that the people who burn coal look to the men who own the mines and to the men who work in mines to come to terms and to keep at work. It is not a private quarrel but a public issue.

It is significant that while the Coal Commission does not claim authority to negotiate or arbitrate it does mention in the opening sentence that it has a specific duty to investigate causes of strikes and in the last sentence it suggests that it will not hesitate to fix the blame if the mines are shut down on April 1. Were an impartial body like the Coal Commission to place the blame all admit the possibility that the public then would be likely to take into its own hands the matter of arbitrating the disputed points, without being invited by either side most immediately concerned. The text of Chairman Hammond's telegraphic appeal to operators and mine workers' committee follows:

"The United States Coal Commission respectfully calls your attention to the fact that among the subjects assigned to it by the Congress of the United States for investigation is that of the causes which from time to time induce strikes in the industry. There is sharp conflict in opinions expressed to the commission as to whether the cessation of work on April 1, 1922, in the unionized bituminous-coal fields of America was a strike by the miners or a lock-out by the operators.

"As the duly appointed representatives of operators and miners in the fifteen organized union districts, you have met for the purposes of finding a way to maintain peace in your fields. Failure to agree would create an intolerable situation. Such failure would inevitably result in most serious injury to the general business and common welfare of this country. All branches of the industry have promised this commission their co-operation in the discharge of its duties. The commission, therefore, in the public interest urges upon you the obvious necessity of promptly devising some plan whereby the mines affected by your conference will be kept in operation to the end that the revival of all industry be unchecked, the uninterrupted flow of commerce among the states be maintained, and the menace of an insufficient coal supply be averted.

"Business halts while in doubt as to your action, and awaits with anxiety the speedy and successful outcome of your labors! You can contribute to the peace of American economic life by reaching a speedy agreement and avoiding further conflict in the fields under your control. Your agreement will spare the commission the necessity of fixing the blame for failure to adjust your differences."

Development of German Mines Handicapped By Depth of Coal Deposits

BY H. C. HERZOG

Owing to the depths of the German coal deposits and the not over-flourishing condition of the mines, the development of German mine capacity has never gone far beyond actual needs, and cannot nearly be compared with conditions in countries where, as in the United States, the deposits are easily accessible. Apart from considerations of expense, which, especially in the Ruhr basin, always were a weighty matter, the coal syndicates which made it one of their chief tasks to prevent overproduction have exercised a strong restraining influence on development.

In pre-war times Germany had eight bituminous-coal producing districts: Rhineland-Westphalia, Upper Silesia, Lower Silesia, Hanover, Aix-la-Chapelle, Saxony, Sarre and Alsace-Lorraine. Two of them, Sarre and Alsace-Lorraine, have since then been alienated entirely and Upper Silesia in large part. The Ruhr district, which has always played a leading part in the German coal production, has now attained a position of predominance among the country's coal fields.

Of all mining districts the development of the mine capacity in Upper Silesia was furthest ahead of actual production, owing to such favorable conditions as comparatively shallow depths, abundance of timber and cheapness of labor. The intimate relation between the coal industry on the one hand and the metallurgical industry on the other hand in this district has further acted as a spur upon the development of the coal mines.

No authoritative figures are available on the relation between developed mine capacity and actual production in any district. Conditions in this respect are different in almost every mine. An average, it appears, has never been drawn. From various estimates it may be assumed that in 1913 the developed mine capacity in Upper Silesia was approximately 10 to 15 per cent and in the Ruhr district 5 to 10 per cent in excess of the highest annual production.

Since the outbreak of the war development has practically stopped. Seven new shafts, estimated to produce annually about 1,000,000 tons of coal each, have been sunk or are being sunk in the Ruhr district and two in Upper Silesia. None of them, however, has begun producing yet.

At present the developed mine capacity of Germany, excluding the Sarre district and Alsace-Lorraine, can, if the above estimates are correct, be assumed to be 190,000,000 tons per year, taking Upper Silesia as a whole, or from 150,000,000 to 155,000,000 tons after deducting the now Polish part of the Upper Silesian basin.

Actual coal consumption in 1913 of the territory embraced within Germany's present frontiers was 119,000,000 tons, or 75 per cent of the developed mine capacity. The various groups of consumers shared in this production in the following way: Railroads, 21.7 per cent; gas works, 11.1 per cent; electric plants, 6.8 per cent; shipping, 3.8 per cent; industry, 43.5 per cent; domestic fuel, agriculture and sundries, 13 per cent. On the strength of these figures it is seen that the excess of developed mine capacity over consumption is from 30,000,000 to 35,000,000 tons per year. Reparation coal amounts to approximately 20,000,000 tons per year, which explains the strained condition of the German coal situation today.

The total reserve of coal remaining to Germany has been calculated as follows, in millions of metric tons:

Depth in meters	0–1,200	1,200–1,500	1,500–2,000
Total Germany	104,711	67,695	106,496
Ruhr District	71,391	56,061	95,667
Upper Silesia	26,685	5,646	9,140
Lower Silesia	1,546	543	855

Under existing conditions only the strata down to 1,200 m., or at the utmost those to 1,500 m., are of any practical value. The lower levels must be considered as a reserve for the remote future. It is most unfortunate for Germany that through the alienation of Polish Upper Silesia a large part of the best accessible reserves has been lost to the country. The Upper Silesian reserves down to 1,200 m. level were calculated at 170,000,000,000 tons as compared with 71,391,000,000 tons in the Ruhr District. Taking into consideration the levels down to 1,200 m. only, the reserves are 104,711,000,000 tons, or 0.015 per cent of the developed mine capacity.

A SPECIAL MEETING of the Board of Directors of the National Coal Association has been called by President Ogle at the Waldorf-Astoria Hotel, in New York, on Jan. 16. The finance committee of the association will meet just prior to the session of the board.

Purchasing Agents to Issue Chart Showing Coal Consumption, Stocks and Output

A chart which will be both a "business barometer" and at the same time show the production and consumption of coal by industrial concerns in the United States and Canada will soon be issued by the National Association of Purchasing Agents. "The biggest and most important matter ever undertaken by any association" is the way Mark Kuehn, chairman of the fuel committee of the association, describes it. The chart will show three principal lines: A line of consumption, a line showing the coal on hand, and a line of production, which will be furnished by the U. S. Geological Survey. Forms have been sent to every member of the association, upon which each will be asked to make reports showing the amount of coal on hand on the first day of the month, the coal consumed during the month and the coal on hand the last day of the month. These reports are to be treated as confidential, but a tabulation of all reports will be printed each month in the monthly magazine of the association, the *Purchaser*, and will be mailed to each member.

Mr. Kuehn says that the membership of the association buys approximately 80 per cent of all coal consumed for commercial purposes and feels that the committee is in a position to undertake the problem and have a chart that is reliable. The chart, he feels, will prove a dependable business barometer.

The stock line will show the average days of supply on hand from month to month, says Mr. Kuehn, and will be indicative of the future.

The production figures or line will be furnished by the U. S. Geological Survey and will show what the mines are doing and give full information regarding the production of coal.

The first chart will be printed in the January number of the *Purchaser* and will show the lines of production, consumption and stocks for the months of October, November and December, reflecting the trend of business for that period. Thereafter the chart will go to the members regularly each month with a month's data added.

The form on which the members of the association have been asked to report the amount of coal consumed by the industry they represent follows:

Confidential

THE NATIONAL ASSOCIATION OF PURCHASING AGENTS
REPORT OF COAL SUPPLY OCT. 1, 1922

Dear Sir:

This statement will be held strictly confidential, only aggregate totals will be disclosed. Please mail your statement at once if possible. Use estimated weights if exact tonnage cannot be given. Report only in *net tons*. Do *not* report in pounds.

Stock on hand Oct. 1, 1922 ..... net tons
Coal consumed during October ..... net tons
Stock on hand Oct. 31 ..... net tons
Coal consumed during November ..... net tons
Stock on hand Nov. 30 ..... net tons

.....
Name of Company.

.....
Name of P. A.

.....
City and State

This report mailed
.....
date

The fuel committee of the association has been active during the past year. Items of interest and data with definite information are regularly supplied from various sections of the United States and Canada by fuel counsellors, and furnished for the members through the *Purchaser*. The association took a leading part in the hand-to-mouth policy of buying coal adopted following the conference called by Secretary Hoover in Washington, thus augmenting the movement which the association already had under way.

Warriner Avers Shamokin and Mount Carmel Mines Are Working Full Time

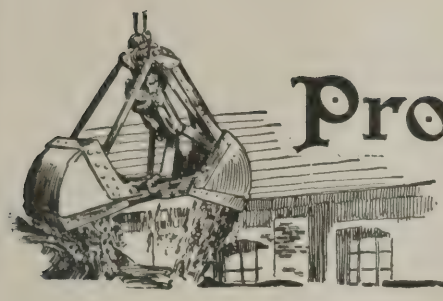
Following a newspaper statement that miners are being deprived of the opportunity to work in the Shamokin and Mount Carmel districts of Pennsylvania, S. D. Warriner, president of the Lehigh Coal & Navigation Co. and chairman of the general policies committee of anthracite operators, sent the following letter to W. H. Woodin, State Fuel Administrator of New York:

"Any published accounts saying that miners are being deprived of the opportunity to work in the Shamokin and Mount Carmel districts, or in any other part of the Schuylkill region, are entirely untrue. Not only are the mines offering full time work but they are maintaining steady operation, in the Shamokin and Mount Carmel districts especially, under great difficulties due to the prolonged drought. Instead of keeping mines and miners idle, operators are hauling water in special tank trains from Sunbury to supply their boilers, this haul being from 20 to 30 miles, according to the situation of the mines.

"Published stories of great amounts of culm and 'dust' being sent out of the region are merely revivals of a hoary fabrication. For many years good coal has been reclaimed from culm banks, but there is less so recovered today than there was five years ago or four years ago, and the great bulk of it goes into steam consumption.

"Total coal shipments from the Schuylkill region—which includes the Shamokin and Mount Carmel districts—were a little more than 2,000,000 gross tons each in November. Of this total, almost 1,280,000 tons were domestic sizes. The remainder, a little less than 750,000 tons, comprised all the steam sizes shipped from that region, and this tonnage included more than 280,000 tons of buckwheat No. 1, available for domestic purposes when used in combination with larger sizes for steady burning or when used alone to bank household fires.

"Shipment figures to date for December indicate that output will be substantially the same as in November, so that the above figures on total tonnage and proportion of sizes apply to this month. For the entire anthracite territory, including Schuylkill, Lehigh and Wyoming regions, the percentage of domestic sizes shipped was 66 per cent. In November the domestic sizes were almost 68 per cent. For the region as a whole, therefore, the proportional shipments of small sizes are not increasing, but are showing a slight decrease.



"In short, there is no idleness of mines in the Schuylkill region through causes within control of the operators; there is no shortage of coal cars on the railroads serving that region; and there is not, nor has there been, any substantial variation in the proportion of sizes shipped to market."

Production and the Market

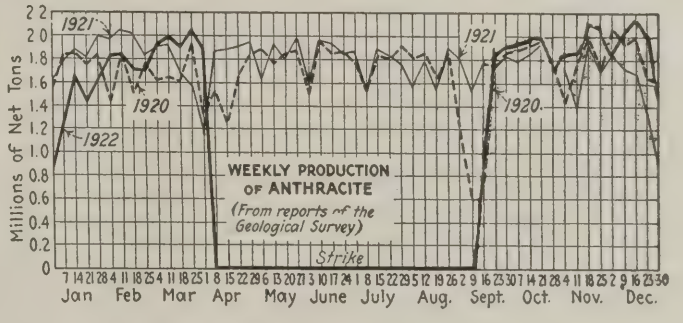
Weekly Review

Holiday business has been surprising in its volume and coupled with the usual idleness of the men and the meager car supply has firmed up all prices. *Coal Age* Index of spot bituminous-coal prices stood at 369 on Jan. 2, as compared with 349 in the preceding week. This is the third consecutive week in which the index number has advanced, and prices have rallied to the level of Oct. 18, 1922. The average spot price, f.o.b. mines, corresponding to this week's index is $4.47; last week it was $4.23.

The holiday lull in production enabled the railroads to make inroads on their line congestion but empties are still very slow in returning to the mining fields. While the volume of demand did not increase last week, it was more apparent than ever because of reduced offerings and shows the urgency of the hand-to-mouth purchasing that has been the rule for so long. It is evident that reserves are so low that they do not permit the least relaxation of current purchases.

Only Steam Prices Rose in Middle West

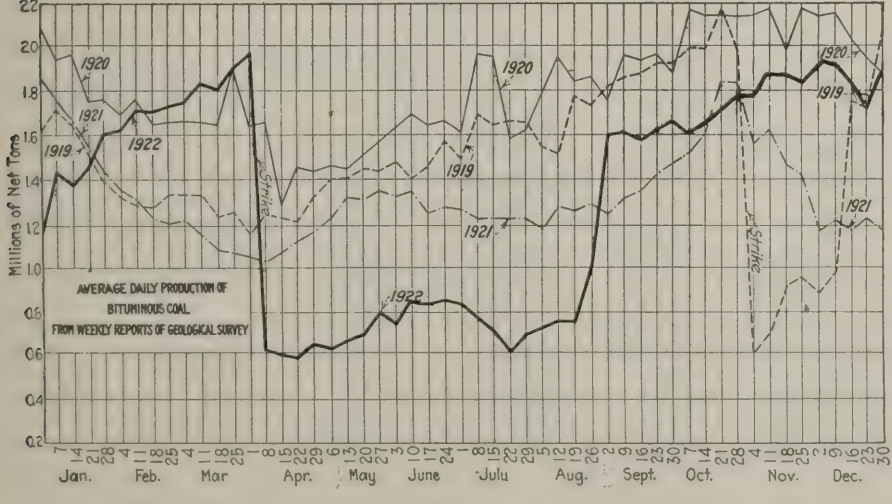
The market ranges from comparative quiet in the Middle West to feverish activity in the North Atlantic section, although New England has not yet felt the urge to buy heavily at the high ruling quotations. Strangely enough, the steam coals were the only ones to increase in price last week in the Middle West, in spite of the fact that the domestic season is at its height and retail supplies far from topheavy.



The Pittsburgh and Cincinnati markets are very firm. Smaller industries are actively seeking tonnage and iron and steel buying is improving. The eastern Ohio field is furnishing over 50 per cent of its output to the railroads and has little free coal to offer. Ohio coal is substituting for anthracite and Pocahontas, the latter being almost unobtainable.

Softer weather has eased the tension in the Northwest. Bituminous coal on the docks is largely under contract, but all-rail offerings are comfortably heavy. The market is basically weak and the weather determines the day-to-day demand.

Light receipts, steady industrial demand and the growing need of screened soft coal to offset the anthracite shortage has done the trick in the East. The market is tight all around, quality coals are no longer quoted and mediocre grades are eagerly sought. Those who must have immediate tonnage are fast bringing a bidders' market for the coal that is rolling.



New England Reflects Conditions

The conditions are reflected in New England. Both coastwise and all-rail shippers have raised their prices but purchases are kept down by the reserves in hand.

The shortage of anthracite really determines the market; gas screened coals move at fancy figures and this excellent demand has reduced the available supply for industrial consumption.

Famine conditions in the anthracite market have put a heavy burden on the retailer. Practically every dealer has had some trouble in distributing receipts but

(*a*) Subject to revision. (*b*) Revised from last report.

mainly because the coal is scattered in small lots. Substitute fuels are also scarce and high priced.

Independent operators obtain large premiums for quick shipments of family sizes. Little of this costly tonnage finds its way to the larger Eastern centers, however, as retailers hesitate to pass such figures along to the consumer. Steam coals are in good demand and there is no surplus tonnage. Prices have rallied to the level of company quotations.

BITUMINOUS

"The production of bituminous coal continued to decline in the week ended Dec. 23," says the weekly report of the Geological Survey. "The total estimated output, including coal coked at the mines, mine fuel and local sales, was 10,031,000 net tons. Increased traffic difficulties and interruptions caused by the occurrence of certain church holidays were largely responsible for the decrease.

"Preliminary reports of cars loaded during the first four days of last week (Dec. 25-30) indicate that production virtually ceased on Christmas Day. It is expected that the probable output will be between 10,500,000 and 10,700,000 net tons. Thus while the total output during Christmas week will be considerably less than that in the week before, the average daily rate of production moved upward considerably because of the less number of working days.

"The estimated cumulative production of bituminous coal during 1922 to Dec. 23 stood at 397,631,000 tons. Production during the first 301 working days of the past six years has been as follows, in net tons:

1917	530,535,000	1920	543,199,000
1918	571,530,000	1921	399,111,000
1919	446,650,000	1922	397,631,000

"Thus it is seen that from the viewpoint of bituminous coal production 1922 is 0.4 per cent behind 1921, 26.8 per cent behind 1920, 11 per cent behind 1919, 30.4 per cent behind 1918, and 25 per cent behind 1917.

"Receipts of coal in New England, according to reports from the Massachusetts Special Commission on Necessaries of Life, during the month of November were as follows:

	Tide (net tons)	Rail (net tons)	Total (net tons)
Anthracite	345,000	650,000	995,000
Bituminous	1,095,000	684,000	1,779,000

"Total receipts of anthracite for the first eleven months of 1922 were 5,470,000 tons, and of bituminous coal, 17,078,000 tons. During the corresponding period in 1921, total receipts were 10,520,000 and 15,716,000 tons of anthracite

* Net tons, f.o.b. mines. † Advances over previous week shown in **heavy type**, declines in *italics*.

and bituminous respectively. Thus it is seen that during the present year to Dec. 1, total receipts of all coal—anthracite and bituminous—was 3,688,000 tons, or 14 per cent less than in 1921."

Hampton Roads dumpings were 277,312 net tons during the week ended Dec. 28, as compared with 300,552 tons dur-

ing the preceding week. Total dumpings for the year were approximately 14,900,000 tons, as compared with 1921 figure of 17,500,000 tons.

During December 376,050 net tons of soft coal and 97,000 tons of anthracite passed through the "Soo." This brought the season's movement of bituminous coal to 8,790,571 tons and anthracite to 670,447 tons. During 1921 the "Soo" movements totaled 12,507,027 and 2,256,128 tons respectively.

Notwithstanding the coal strike, up to Dec. 16 the railroads reported loadings of 7,093,638 cars of coal during the year, as compared with 7,734,627 cars during the corresponding period of 1921 and 9,731,796 cars in 1920.

ANTHRACITE

Production of anthracite declined to 1,976,000 net tons during the week ended Dec. 23, largely due to ceasing work on Christmas eve and the occurrence of certain church holidays. In comparison with the preceding week's output this was a decrease of 221,000 tons, or 10 per cent. Early returns for last week showed that no coal was loaded on Christmas Day and that even on Tuesday, Dec. 26, loadings were but a fraction of normal. It is not likely that the output for the week will exceed 1,500,000 tons. The cumulative output during 1922 to Dec. 23 is 50,872,000, or 38,934,000 tons less than during the corresponding period of 1921.

Anthracite domestic sizes are being distributed as fast as they are received and dealers are swamped with orders. Substitute domestic fuels are relieving the situation, but these, too, are in short supply.

COKE

Production of beehive coke declined to 280,000 net tons during the week ended Dec. 23, as compared with 298,000 tons in the previous week. The decline was general in all coke-producing districts except Colorado and New Mexico.

The Christmas celebrations reduced Connellsville production just at a time when the coke market was very active. The emergency domestic demand upset the boat just when blast furnaces were negotiating first-quarter contracts, and prices offered because of the need for coke as a substitute for anthracite places coke out of reach of regular users. Blast furnaces now say they will be forced to bank or blow out unless lower prices are realized soon. Operators, however, are not inclined to put on more ovens to increase the output, as the longer hauls involved would adversely affect the already poor car supply.

Coal Age Index 369, Week of Jan. 2, 1923. Average spot price for same period, $4.47. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board.

Foreign Market And Export News

Great Britain Ends Year with Maximum Production and Growing Demand

Great Britain is ending the year with maximum production. The output during the week ended Dec. 16 was 5,738,000 gross tons, according to a cable to *Coal Age*, exceeding any week since 1913 and compared with 5,592,000 tons during the week ended Dec. 9.

Severe weather during the past week has increased shipping congestion and price concessions are being made to relieve the situation. A South American railway has placed orders for nearly 250,000 tons of second Admiralty at 26s. and for best Monmouthshire at 25s.@25s. 6d.

According to the Board of Trade returns exports of coal during November totaled 6,570,578 tons. In the last eleven months the quantity of coal exported was 58,243,742 tons, compared with 20,351,390 and 22,629,777 tons respectively in the corresponding periods of 1921, and 1920.

Numerous contract inquiries are circulating from France, South America, and other directions over the coming year. The market in Northumberland and Durham is very stable but there is not enough coal to go around. Among the inquiries are the following: The Norwegian State Railways, 35,000 tons of best steam coals for shipment during the next two months; the Frederickshaven Gasworks, 2,000 tons of Durham gas coals; the Aalborg Gasworks, 2,000 tons to be shipped during January; the Soviet Government, 150,000 tons of Northumberland steam coal for deliveries monthly during next season, and the Esthonian State Railways 10,000 tons of steam coals for shipment.

Supplies Gain at Hampton Roads

Little change from the dullness of the past two months was apparent at the end of the year. Total dumpings were approximately 14,900,000 tons, against approximately 17,500,000 tons for the previous year.

Car shortage continued the chief factor in the situation, with stocks somewhat increased after the holiday let-up in output. Demand had fallen off somewhat, with a consequent reduction in prices.

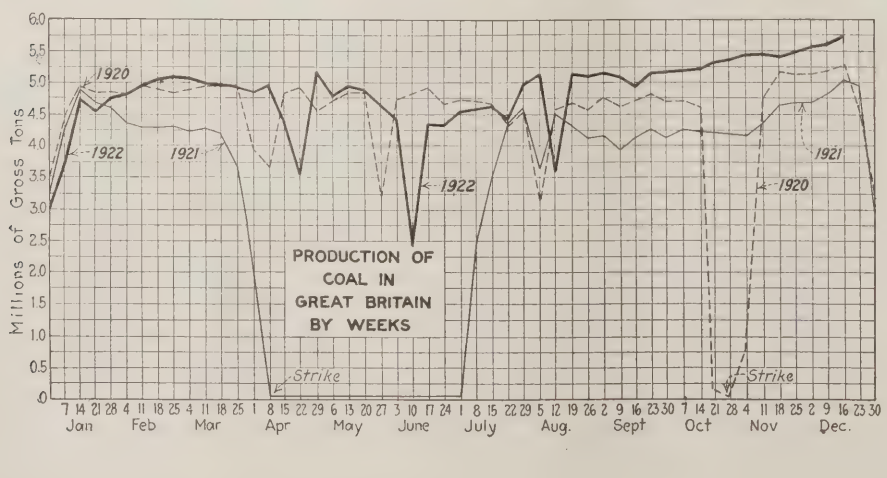
German Production Is Inadequate

The Prussian State has just published its report on coal mining for the first nine months of the current year. As 96 per cent of Germany's production of bituminous coal falls to the share of Prussia, the report permits a comprehensive survey of German coal mining.

GERMAN COAL PRODUCTION

	First Quarter	Second Quarter	Third Quarter
Ruhr	23,958,226	21,899,931	23,594,753
Upper Silesia	2,197,640	2,080,057	2,237,917
Lower Silesia	1,356,251	1,304,753	1,421,158
Bonn	1,568,685	1,407,375	1,491,776
All others	138,188	131,911	145,502
Total	29,218,990	26,824,027	28,891,106

The figures for Upper Silesia do not include the output of the detached part of the province prior to its division, which was 12,577,905 tons. Germany's coal resources are in the main situated near the frontiers. This is of special interest in view of the threatened occupation of the Ruhr district.



Production in Upper Silesia was 775,371 tons in November as compared with 812,685 tons in October.

English coal shipments to Germany have been falling off during the last 60 days, although up to the autumn months the total imports had grown by leaps and bounds.

BRITISH COAL IMPORTS IN GERMANY

	Tons
January	247,300
February	359,900
March	467,700
April	256,600
May	601,500
June	889,600
July	1,133,400
August	1,165,200
September	1,060,800
October	918,600

At the allied conference the French have asked that an allied or French commission be set up at certain points in the Ruhr to control delivery of the amount of coal ordered by the Reparation Commission. Also that a tax be established on coal in the Ruhr district, under an allied or French commission. One-quarter of this tax to be payable in foreign currency, and it is estimated that 400,000,000 gold marks a year can be collected.

U. S. Exports During November

November exports were 440,208 tons of anthracite and 1,618,037 tons of soft coal as compared with 329,380 and 1,078,806 tons respectively in November, 1921. For the eleven months this year there were 1,983,429 tons of anthracite and 9,614,195 tons of bituminous coal exported as compared with 1921 figures of 3,869,944 and 19,822,735 tons respectively.

North Atlantic

Events Combine to Boost Market on All Coals

Though Prices Rise Rapidly, Little Free Tonnage Is in Sight—Bidding Now Common—Best Grades Disappear—Domestic Demand Out of Bounds.

Curtailed holiday production, insufficient car supply and inclement weather have boosted the market on all coals. Although prices have increased rapidly in the last two weeks there is very little free tonnage to be had and those who must have an immediate supply are bidding for the coal that is rolling.

Mediocre coals are now eagerly sought, as the best grades are practically unobtainable and reserves at the smaller industries are evidently approaching the danger line. The domestic demand has grown out of bounds and has further cut into the available spot supply. Shippers are securing fancy prices for screened coal that is on wheels.

BALTIMORE

Industrial demand has increased to such an extent that the meager supply is very inadequate. The car supply is wretched, and even the lightened production due to Christmas and New Year holidays could not be taken care of by the number of empties received.

Prices kept mounting and even mediocre coals were quickly absorbed around $4 and better. The greatest trouble with traffic at present seems to be the widely scattered distribution of coal cars and the inability of the railroads to get quick unloading and dispatch.

The export situation continues a closed book. A review of the industrial situation in Maryland shows that while a few of the larger industries have fair supplies ahead that others of important nature are now at the danger line. In an effort to prevent any industrial stagnation, some of the coal men are using their discretion about handling in full some of their contract calls and giving a little of the coal to emergency cases.

NEW YORK

Very little spot coal is being offered. While reports show the cars at the local terminals to be steadily increasing it is known that most of the coal is on order and that the free coals consist mostly of Pool 11. Quotations are increasing rapidly, most grades showing advances of $1.50@$2 from those of about two weeks back.

Demand is stronger but there is no flood of orders. Inquiries have increased probably because of the continued car shortage which is as bad as it was before the Christmas holiday. Public utility corporations are now in the market and several railroads are buying high-volatiles around $3.50.

The use of bituminous coal as a substitute for anthracite has aided in keeping down the supply at the local terminals. Screened bituminous has grown into such favor that the supply cannot meet the demand. Some operators are refusing orders until they get caught up.

Coke is in good demand. Some houses are booked so far ahead that new orders are being refused for the present. Quotations for 48-hr. run of oven, low-sulphur, range from $8.50 without car numbers to $9.50 with car numbers supplied; prepared coke is being quoted around $12.50 at ovens.

There were about 2,679 cars at the local piers on Dec. 29, as against 2,465 cars the previous day.

High-volatile coals, including Pool 4, were quoted around $4.85 f.o.b. mine; slack, $3.75@$4; ¾-in. lump, $5@$5.50. Other quotations heard late in the week included Pool 14 at $8.25@$8.50, f.o.b. local piers.

CENTRAL PENNSYLVANIA

Slight improvement is noted in the car supply. On the Cresson division of the Pennsylvania there was a 30 per cent distribution on several days last week, due, it is said, to the fact that the railroads are pretty well stocked, thus releasing cars for commercial purposes. Conditions are reported worse along the New York Central lines. On the Pittsburgh, Rochester & Buffalo road there is still a 100-per cent distribution. However, this line does not reach much of this field.

Production shows but little variance from November. Up to and including Dec. 21, the production was 54,910 carloads as compared with 55,303 cars for the corresponding period of November. Prices are advancing and are higher now than at any time during the fall and winter.

PHILADELPHIA

The holiday season has had the effect, as usual, of curtailing production, and this combined with the indifferent car supply, has made it a difficult matter to anywhere near meet the demands of the consumer. With winter just beginning it looks as though the consumer without heavy reserve stocks is going to find it difficult to have his needs cared for. The promise of betterment in the immediate future is not encouraging, as no sooner are the regular holidays over, when the celebration begins all over again on Jan. 8 with the Greek Christmas.

Prices have again gone upward, but as there is so very little tonnage to be had it really doesn't mean a great deal, as most consumers are being supplied by their shippers on contracts or on block orders placed a long while ago. In many instances the consumer who is seriously short simply makes new offers in his desperation for fuel, and most spot sales recently at high prices have been for coal which was rolling.

Those concerns with good grades of coal who have been making a bid for a domestic market for their fuel are receiving added encouragement from their customers, who state they have developed many users who expect to continue the use of soft coal. The only drawback at present is the slow movement of coal on order.

FAIRMONT

Cars are more plentiful than in the high-volatile fields. Many of the mines, however, especially those loading commercial fuel are not getting as much as a 30-per cent supply of empties. The Western Maryland is furnishing more cars proportionately than is the B. & O. The Christmas holiday intervened to curtail production somewhat. Prices are advancing in response to a heavier demand.

UPPER POTOMAC

The advent of the holiday period found mines in the Upper Potomac and Georges Creek regions producing coal on a somewhat larger scale than had been possible earlier in December. The improvement was especially marked in the Upper Potomac region. With the demand in the East attaining larger proportions, prices are on a somewhat higher level.

West

SALT LAKE CITY

Retailers are doing a good business, but operators report things as quiet. Prices remain firm, except for nut coal. More "charity" coal was sold during the holiday season, according to one prominent dealer. On the other hand another leading firm said fewer persons had bought coal for presents this year than for a long time. The labor and car situations continue satisfactory.

DENVER

Transportation has grown a little easier in Colorado and the softness of the weather has slowed down the market so that plenty of coal is reaching everybody who wants it, with prices steady as follows: Walsenburg lump, $6; nut, $5.50; Trinidad lump, $5.50; nut, $5.25; Canon City lump, $6.50; nut, $6. Production is a little better but the state's total for the week was only about 56 per cent, which is from 10 to 15 per cent less than the running time of all the surrounding coal states.

KANSAS CITY

With a slightly strengthened market as a result of the recent clearing of mine tracks of no-bills and a consequent diminution of supply, coal men of this district are feeling the pinch of weakened transportation. Kansas mines are operating from 40 to 45 per cent of normal time, and Arkansas mines, the products of which must be moved a greater distance, only 25 per cent of normal. Unseasonably, warm weather so far has kept the situation from becoming extremely serious.

Quotations on Kansas coal are: Lump, $5.50; nut, $5; mine run, $3.75; screenings, $2.50. Arkansas coal is quoted at $6 for lump; $4 for mine run, and $2 for slack.

Anthracite

Retailer Heavily Burdened As Icy Temperature Appears

Distribution of Small Lots Covers Wide Area — Substitute Supply Low — Storms and Poor Car Supply and Motive Power Hamper Delivery.

The advent of severe weather has placed a heavy burden on the retailer. Receipts of anthracite have been sufficient to keep the yards working at top speed mainly because the small-lot distribution has been spread over an unusually wide area. The supply of substitute fuel is running down, as cars are scarce in the soft-coal fields and deliveries are hampered by storms and poor motive power.

Independent producers are securing their own figures for prompt business, although the East is taking but little of the higher-priced coal. All steam sizes move easily and buckwheat commands a premium. Washery product sells at very little price concession.

BALTIMORE

The last days of the old year brought a better run of anthracite to Baltimore, just when the majority of yards were completely out of coal and hundreds of householders were clamoring for new supplies. Some relief also came through the arrival of coke.

In order to speed the deliveries, the Police Department lifted the ban against deliveries on Sunday. The better arrivals of anthracite in the past few days will probably give the "coal politicians" another chance to give out a story to the daily press of Baltimore telling "what we did." This entire situation is one of the few points of comedy in the fuel supply situation in the minds of people who really understand the coal trade. Because of light call at city stations established to sell fuel to the poor it has been practically decided to abandon this means of relief.

NEW YORK

The local situation is serious. There is little domestic coal to be had and the supply of substitutes is growing less. Cold weather has resulted in a greater demand which the dealers are not able to meet. Domestic coals, including pea size, arriving here disappear almost as rapidly as they are received.

The peddler pool coal stations provided by the State Fuel Administration are doing a better business than when first established. A couple of thousand consumers living in the lower section of Manhattan who had bins large enough to hold a half-ton were enabled to secure that quantity early last week through the co-operation of the Fuel Administration and one of the large retail dealers.

Cashiers' checks are being offered by buyers in the mining fields for quick shipments, according to information received here. Not much of the high-priced domestic coals of the smaller independent operators are being brought here.

Pea is as short as the larger sizes. Offers of washery pea coal at around $13.50, alongside this harbor, were reported late in the week, while fresh-mined pea was quoted at $14.75, alongside.

Buckwheat has gained much strength. The surplus has been cleaned up and is growing scarcer. The better grades of independent product are going at a premium over company schedules. Rice and barley are holding firm. Current prices are quoted in the Weekly Review.

BUFFALO

The hard-coal trade is just now facing a big snow storm and it sets people to teasing for coal as they have not done in the time just passed when there was not much snow and only cool weather. Dealers do not really believe anyone is suffering for want of fuel, but there is at least much inconvenience and it is going to last till the worst of the winter is over. It is useless to expect more than that. The consumption equals the mining.

The independent shipper rubs his hands over the advance from $9.50 to $14.50 and is pleased to know that the consumer who would not pay the smaller price is eager to pay the larger one now.

The Mayor of Buffalo has set a policeman to counting the cars of coal that go across to Canada, though nobody believes that he knows hard coal from soft and there is enough soft coal for all. And if it was all anthracite the Mayor has no authority to act in the matter.

After the Lake trade closed some of the shippers diverted some cargoes that did not get off, into the local trade, and the increase has made a big difference in the situation. But the one-ton delivery is likely to last just the same.

PHILADELPHIA

The advent of wintry weather has put a heavy burden on the retail trade. Buyers in their eagerness for coal are going from yard to yard in the hope that they can find some dealer willing and able to care for their needs.

Dealers generally admit that there have been good shipments of coal made to them during the past ten days, and with some of them the cars accumulated just a trifle faster than they could unload. These latter cases were, of course, exceptional.

Practically every dealer has received enough coal to keep him busy. Unfortunately, they are all so far back on their orders that they hardly know where to send the coal. The time has come when those people who, earlier in the fall were served with one or two tons, are now coming back for replenishment.

The larger companies say that they are fully up to their allotments of 60 per cent of last year's supply. Prices, both wholesale and retail, remain quite stable, and it is really exceptional to hear of offerings of coal at any price. Occasionally a dealer has been known to seek a car or two of family coal at prices up to $13, but unable to place the business. However, in another instance a dealer was able to place an order for two cars each of egg, stove, nut and pea at a flat price of $12.

The steam trade is strong and there is no surplus buckwheat, as the companies who were storing this size are now picking it up. Independents are getting up to $5 a ton for such buckwheat as they sell on the market. The companies still have sufficient rice, but barley is being more closely taken. Most individual shippers are moving all steam sizes without difficulty.

BOSTON

Protracted gales and thick weather along the coast have interfered with arrivals, and all-rail on accentuated car shortage together with light production have meant very meagre receipts recently. There is a feeling that with full output in January the hard-coal situation will gradually correct itself, but of course a further season of storm and cold will upset such calculations.

At retail the dealers are managing somehow to keep things going. A reasonably heavy tonnage of bituminous is being used in place of anthracite especially in apartment houses, and this is bound to be felt later on.

South

BIRMINGHAM

The accumulation of empty coal cars during the holidays has served to afford a fairly good quota at all mines and is expected to give temporary relief to the car shortage for the remainder of the week. Mine labor is somewhat slow in returning to work and normal forces will probably not be available until after New Year's. Output for the week of Dec. 23 and also for the week of Dec. 30 will be considerably below the weekly average, due to the mines being idle on account of Christmas.

The market for both commercial and domestic coal has been very quiet during the past week. Continued warm weather has slackened interest in domestic trade and there is no insistent demand for such fuel except as occasioned by the recurring periods of cool weather. There will probably be more favorable market conditions and a better demand for commercial coal after the turn of the year.

Prices remain stable, no changes being noted over the quotations given a week ago.

VIRGINIA

Production is much below market requirements, owing to further losses sustained as a result of an even more limited supply of empties. About 22,000 tons of coal per week are being used for the production of coke, there being a ready demand for it in the district. More coal is being produced on the line of the C. C. & O. than on any other line in the district.

Chicago and Midwest

Markets Hold Strong on Everything They Can Get

Demand Is Fairly Stiff for Both Steam And Domestic Though No Heavy Stock Call Is Heard—Railroads Hold Down Production under 50 Per Cent.

Nothing seriously worries the coal markets of the Midwest region nowadays. All available coals are in fair demand at firm prices high enough to make it worth anybody's while to handle coal. Illinois and Indiana domestic sizes bring $4@$5.50 and there is a place for all that can be shipped. Steam buyers take enough of the smaller sizes to keep distress coal practically off the market even though few of them are buying heavily for stock, apparently figuring there is real doubt of a spring strike. Steam prices are steady and have advanced a little in Indiana.

Transportation, which was extremely bad a week ago during the pre-Christmas zero weather, has slowly improved during the recent comparatively warm spell but production in this territory is still below 50 per cent. This is enough to just about take care of the demand on Western coals. Traffic congestion is keeping most shipments from the East down low.

CHICAGO

After weathering a period of painful transportation trouble and a coal spell which snapped up demand for all sorts of coal to the rush point, concerns here are still busy meeting a fairly strong call for most coals. Domestic sizes are maintaining last week's prices evenly. Steam demand has pushed screenings in Indiana up about 25c. and the trade is buzzing along at a good clip in spite of a week of weather that was decidedly warm for late December. Car supply has been improving a little throughout Indiana and Illinois, but it still is an exceptional mine that works more than half time.

There is no sign of immediate heavy stocking by big consumers here. The slow process of rolling in small reserves continues, but the general opinion of Western operators that a strike is going to be avoided has already taken off what little edge there was to storage demand. Buyers here give evidence of planning to wait at least until after wage conferences start before they decide what to do about preparing for a spring shut-down of mines.

Very little coal other than that from Indiana and Illinois is trading here now. A Cincinnati transportation jam has shortened down shipments from the East materially and Kentucky coal is now going principally to other markets, though it requires very little encouragement to start a flood of western Kentucky fuel in this direction. Anthracite at mine prices ranging $6.25@$8.25 continues to come in a small but steady flow through one big Erie shipper retailing here at $14@$17. Pocahontas shipments here are slight indeed. Current prices are quoted in the Weekly Review.

ST. LOUIS

A little cold weather has caused a picking up in the domestic market in St. Louis proper. This is chiefly for small loads and the cheaper grades. Country domestic has also shown up a little better the past week. Steam is slow locally and in the country but a good tonnage is moving to the Chicago market. There has been no change in retail prices.

A little storage coal is being put in by big manufacturing plants. One plant reports 50,000 tons on hand Jan. 1 and another, 15,000 tons. These are fully supplied and are about the only two plants that have their storage up to the maximum.

SOUTHERN ILLINOIS

While the weather is not exactly seasonable, yet the demand for the better grades of Carterville and Duquoin coal has been good and most mines are sold up on all sizes. This is principally caused by the car shortage which has given the mines about two days working time the past week. Mines producing an inferior coal, however, have no bills on hand. The association mines are maintaining a price of $5.50 on the domestic sizes and $3 on screenings. The independent mines are as low as $4.50 on domestic sizes and $2.75 on screenings. Railroad tonnage is fair.

Mt. Olive movement is slow on everything excepting railroad tonnage, which is fairly good to the Northwest. Car supply is sufficient to cover the demand. Domestic sizes in the St. Louis market sell for $4 and outside for $4.50. Steam sizes, egg and nut, are a little heavy selling down to $2.50.

In the Standard district conditions are unusually bad on account of no cars. Pennsylvania lines have been jammed up in the last two weeks, perhaps the worst in several years. The B. & O. have a record at one mine of giving it cars for fourteen hours' work between the 18th and 30th of the month.

Prices on Standard 2-in. lump are $3 @$3.25; 6-in., $3.75@$4; steam nut and egg, $2.50@$2.75; mine run, $2.35@ $2.50. Car supply in this field varies from one day a week to three days on different roads. Steam is moving about equal to domestic sizes.

INDIANAPOLIS

After nearly a week of zero weather, moderating temperatures have softened the coal business, especially the retail end. The holiday season hurt the industrial demand, as many of the plants in the state closed during the week for inventory.

In those instances where prepared grades had been increased 25c. a ton and sometimes slightly more because of the sudden rush with the advent of zero weather, a relapse has been noticed in the prices. Prices of West Virginia and Kentucky coals continue weakening slightly. The transportation situation has been such in the past two weeks that the normal flow of these coals into Indiana has been hampered, but even with slightly less tonnage delivered there is no price strength.

LOUISVILLE

Jobbers and producers report a dull market this week, and except for the very light loadings, due to car supply and the fact that miners are loafing, prices would probably be lower than last week. With the mildest sort of weather general consumption is light, and industries are refusing to place much tonnage until after the inventory period. Jobbers report that there is no general inquiry from any line of industry. Retailers are buying in very small quantities.

Calling off of some railroad embargoes on movement of freights other than coal, food and livestock, show that terminal congestion is being relieved, and the transportation situation looks much better, provided there is no heavy snow or severe weather. Present indications are for better return of empties to the mines, and a softening rather than a strengthening of the market.

Quotations show eastern Kentucky lump, $6.25@$7; mine run, $3.25@ $3.85; screenings, $3@$3.50; western Kentucky lump, $4.25@$4.50; mine run, $2.50@$3; screenings, $2@$2.25.

WESTERN KENTUCKY

Miners have done little work since Christmas, and many mines have been down, or limping along on short forces. Poor car supply has not been felt so much the past few days, due to the poor loading capacity. However, transportation is light, and with good weather indications are that railroads are cleaning up congestion, and that there will be a much better car supply available before long. In fact it is now showing some improvement. Transportation conditions are better generally, it is said.

Prices are firm but not advancing as had been anticipated when a few days of cold weather broke in shortly before the holidays. Some operators report that they are just about supplying contracts, booked business, etc., and are not soliciting orders until the holidays are over, being unable to figure a good production. Industrial demand is slower over the inventory period and with mild weather price advance looks to be checked for the time being, especially if car supply improves.

Christmas was the warmest December 25, since 1893, and as a result of the very mild weather retailers are buying in small lots, as domestic demand has been quiet generally since just before Christmas. Even charity orders on retailers for half to ton lots, have been scarce this year.

Quotations at which coal appears to be moving show lump at $4.25@$4.50; mine run, $2.50@$3 and screenings, $2 @$2.25. However, some lump is quoted as high as $5, and some low grade at $4, while some mine run quotations are reported as high as $4 and screenings as high as $3.

Eastern Inland

Wintry Blasts Hit Car Supply; Market Stiffer

Domestic Is Strongest Feature—Smokeless Practically Unobtainable—Offerings of Industrial Fuel Curtailed by Holiday Idleness—Volume of Demand Unchanged—Quotations Advance.

Severe weather has made the car supply more irregular and the market has stiffened further in the past week. Domestic coal is, of course, the strongest feature, as retailers are hard put to replenish their stocks, which are rapidly being distributed to householders in response to an active demand. Smokeless sizes are practically unobtainable.

Holiday idleness reduced the offerings of industrial coal and while the volume of demand remains unchanged the advancing quotations show the urgency of consumers' hand-to-mouth needs, as the spot tonnage is being accepted without any price bickering.

CLEVELAND

Domestic consumers have small amounts on hand and dealers have not been sufficiently well stocked to supply the demand without replenishing their supplies, with the result that coal buying on the part of dealers has been more firm. Gradually consumers are learning to substitute soft coal for anthracite and West Virginia coal, which is difficult to obtain. Railroads are buying a larger tonnage than any other consumers.

Southern coal is coming into this district more easily over the Wheeling & Lake Erie, but shipments that are routed by way of the C. & O. have been delayed the last few days in contrast to a recent increased movement by this route.

Pocahontas shoveled lump is sold at around $13, delivered. Prices on Ohio coal shipped here are remaining firm. Good buying is expected on the part of steel plants in this district after the turn of the year. Mills are booked with orders for some months to come, demand is strong and prices are stiffening. The backbone of steel demand is the large purchasing by the railroads.

EASTERN OHIO

Operations were at a minimum during the pre-holiday week. On Dec. 18, about 1.140 cars were loaded, and each succeeding day registered a lower output, on Saturday, only 721 cars being loaded. Aggregate production amounted to 266,000 tons, the lowest figure for any six-day week of the year.

Severe weather has slowed up railroad movement to a considerable degree. At the present rate of production, over half of eastern Ohio's output is going to the railroads for fuel, both for current needs and necessary reserve stocks at this time of the year. Consequently the supply of fuel available for other steam users has become more restricted and keen demand from that quarter has stiffened up prices from 25c.@50c. per ton on most all grades.

With the present status of the coal trade, due principally to transportation conditions which are not expected to improve much before spring, and the possibilities of another coal strike at the end of the coal year, many operators are advising their customers to not only buy now for current needs, but to begin building up their reserve fuel so as to be on the safe side.

Retail demand is unusually active and current supply is inadequate.

Cumulative figures covering the output for the calendar year to Dec. 23 indicate an aggregate production of 10,902,500 tons, as against a potential capacity of 30,834,000 tons, or only 35 per cent operations.

Receipts of bituminous coal at Cleveland during the week ended Dec. 23 fell off 500 cars from the volume received during the preceding week. Total arrivals were 2,552 cars, of which 1,988 cars were for industries and 664 cars for retail yards.

PITTSBURGH

While the general average of car supplies may not be different from that of a month ago, there seems to be much more irregularity from day to day, and between divisions. The uncertainty seems to have an influence on market prices, which are stiffer, although the total demand is not materially altered. No definite information is available as to stocking of coal by consumers but there is reason to assume that there is a very fair volume of stocking, possibly more than there was a year ago.

Pittsburgh steam coal has sold both at $3 and $3.50 in the past few days, although there are no differences in tonnages or grade sufficient to account for so wide a spread. Youghiogheny gas is decidely higher, having brought as high as $4 for mine run. Gas slack is irregular, and generally quotable at $3@3.50.

Industrial consumption appears to be improving a trifle. The steel mills have run through December at their former gait, instead of curtailing as they usually do at the year-end. Prospects are for heavy operation through the first quarter.

DETROIT

With the holiday season at hand, other interests apparently are taking precedence over the business of buying bituminous coal. Sales are coming at irregular intervals. The buyers generally seem to be limiting their purchases to the smallest quantity that will provide for current requirements.

Receipts are not large. Jobbers say the shipments at present are scarcely equal to the quantity of coal moving into the city before the closing of navigation on the Lakes. The decrease is attributed to the effect of railroad embargoes, as well as to the transportation obstacles created by winter weather.

West Virginia or Kentucky lump and egg is quoted at $5.50, with mine run, $3.25 and slack, $3. Pittsburgh No. 8 lump is $4.25; mine run, $3.25; slack, $3; Hocking lump is $5.50; egg, $5; mine run, $3; nut, pea and slack, $2.90. Smokeless lump and egg is around $8, with mine run and slack, $5.75@$6. The supply of smokeless continues light.

Anthracite receipts are not increasing and little encouragement is given to hope for a more adequate supply.

COLUMBUS

The coal trade is showing considerable strength, even during the holiday period when the market is usually unstable. Prices are on the upgrade although advances have not been heavy.

Domestic trade is still the big feature, with retailers buying actively to rep'enish stocks. Householders are placing larger orders as the cold weather has apparently come to stay. Retail prices in Columbus are steady and the cutting of several weeks ago has disappeared. Only a small tonnage of smokeless is finding its way into the market.

Steam business is showing more activity in all localities. This has caused an advance of 15c.@25c. Assigned cars for railroad fuel comprise a good percentage of the output.

The car supply is not increasing and is estimated at from 35 to 40 per cent in the Hocking Valley, Crooksville and Pomeroy fields. Following Christmas there was a pretty fair run but some mines have not produced, owing to the disposition of miners to stay away from work.

BUFFALO

The market is decidely quiet, but the scarcity of cars has stiffened the prices some. A very heavy passenger business during the Christmas holiday seems to have taken up the motive power and when that drops off, as it will soon, the light demand is expected to restore prices to the old rather low level.

The labor situation comes in for a large amount of discussion now. There had been a general prediction of an April strike, but recent declarations from the union head that there will be no strike has set the speculation in a somewhat different direction. It is pretty plain that the meaning of the speech is that control of the situation can be held without a strike.

Consumers are not inclined to buy much coal against strike possibilities. The entire trade is becoming used to some sort of a struggle and is prepared, though not welcoming it.

Quotations are: $4.75@$5 for Youghiogheny gas lump; $4.25@$4.50 for Pittsburgh and No. 8 steam lump; $3.50@$3.75 for all mine run, and $3@$3.25 for slack, adding $2.09 to Allegheny Valley and $2.24 to other coals, to cover freight.

NORTHERN PANHANDLE

Owing to transportation conditions railroad fuel loading is larger than any other class of business. River shipments and local deliveries are helping to swell the sum total of production. More coal is being used in the iron and steel mills in the Wheeling district. Embargoes are interfering to some extent, however, with Western shipments. There is a steady demand in Northern markets.

Northwest

Free Dock Coal Scarce: Region Relies on Rails

Lake Shipping Brought Less Than Half Normal Supply—Extra Effort May Get Overland Anthracite—Demand for Coal Softens with Weather.

Now that Lake shipping is ended for the season there are many eyes on the dock coal stocks. A good deal of bituminous is on hand but most of it is railroad or contract fuel so that free coal is scarce indeed. Soft coal by rail is so easily available, however, that there is no worry about that. Anthracite is a different story. Extra and official effort is being made to get considerable hard coal by rail all winter.

The comparatively warm weather of the past week was been enough to return the market almost to its pre-cold snap lethargy so far as bituminous is concerned. Price concessions were resorted to again before the end of the week and surplus coal is on the market throughout the southern Lake country.

MINNEAPOLIS

With the close of the old year, the federal fuel distributor for the Northwest ceased his labors. At about the same time, the available stores of anthracite were exhausted in the hands of wholesalers. For the remainder of the winter, the Northwest must depend upon all-rail receipts. The season has seen between 40 and 50 per cent of a normal season's stock received and the carry-over would run the entire total up to perhaps 60 or 70 per cent.

The coal selling season is at its height and it will be up to the trade to worry along as best it may, until spring. There is a pronounced shortage of hard coal. How much cannot be determined, since it is so entirely a weather proposition. Undoubtedly the normal consumption has been reduced by mild weather and by the use of other grades.

The soft coal market is easier again. The weather moderated sharply after a few days of real cold. Consumption and buying took a sharp slump. During the severe weather, there was no surplus coal in the market, but it reappeared soon. It has not demoralized the market but price concessions have been forced. The dock trade found the severe weather a big help toward stabilizing its market, and has been able to present a fairly consistent market position for some days. But the market basically is weak.

MILWAUKEE

The market is quite active, as an aftermath of the recent zero weather. Local consumers of anthracite are forced to buy sparingly, as the dock companies are conserving stocks in order that they may be able to deal equitably with both the city and country trade. Soft coal and coke are in good demand. Western screenings are fairly plentiful, but the popular sizes of coke keep well sold out. There is a scarcity of screened Pocahontas but an abundance of mine run.

A real hard cold snap is bound to make business lively for everything burnable, as coal dealers have only been buying to meet immediate needs, notwithstanding the uncertainty of rail transportation in winter. The rail situation at present is about 50 per cent of normal. There have been no changes in prices.

The hard coal shortage is so acute that the state fuel authorities contemplate, in the event of prolonged cold weather, seizing of anthracite for adequate distribution. The State Legislature will be asked to give the coal authorities more power to dictate to coal distributors. With distribution centralized, it is believed every community will get its just share of hard coal.

Wisconsin has received only 29 per cent of a normal anthracite supply. Ample stocks of soft coal will tend to relieve the hard coal shortage. Gov. Blaine is using every effort to secure at least 250 carloads of anthracite daily during the winter.

Many complaints have been received by coal dealers of the poor quality of coal that is being marketed.

DULUTH

Estimated stocks on the docks here now come to 2,700,000 tons of bituminous coal. Of this, 1,000,000 tons is owned by the railroads and 1,000,000 tons is under contract. This leaves 700,000 tons free. The demand for both anthracite and bituminous has dropped off appreciably in the last week. Mild weather causes the anthracite slump. There are some hard-coal stocks still left on the docks but these are being apportioned out to satisfy the need, so there is really no free anthracite. Householders are using a good deal of buckwheat mixed with egg.

A notice of real suffering from lack of anthracite at Streeter, N. D., and Marble, Minn., has been received here from C. P. White, retiring fuel administrator at St. Paul. Mr. White asked that anthracite be shipped immediately and the order was complied with.

The slackness in bituminous coal comes from the fact that consumers have purchased well already, and are in the main overstocked for present needs. There seems to be no doubt that the Northwest will come through the winter on the stocks on hand and what will be shipped by all-rail.

A comparison of prices with last year in the bituminous market is interesting. Now soft coal is selling at $9.50 for lump, $8.50@$8.75 for run of pile and $6.25@$6.50 for screenings. Last year at this time bituminous coal was selling for $6 for lump, with a 50c. differential for run of pile and screenings. Pocahontas is in strong demand.

New England

No Let-up in Inquiry for Good Low-Volatile Coals

Prices Climb Steadily—Slow Delivery All-Rail from Central Pennsylvania Causes Some Declination of Commitments — Reaction in High-Volatile Sets In.

Due to heavy demand from householders, inquiry for all the favorably known low-volatile coals has by no means relaxed. Quotations advance every few days. Deliveries all-rail from Central Pennsylvania are very slow and in many cases operators have been obliged to decline making further commitments.

For a considerable period there was no appreciable increase in demand for coals in excess of 30 per cent volatile, but now there has set in a reaction in that direction as well. Grades that were selling at $2.75 per net ton at the mines a fortnight or so ago have sold recently as high as $4.50, and so long as the anthracite situation remains uncorrected there is every prospect that prices will continue to advance. It is notable that coals originating as far west as Pittsburgh and taking a relatively high tariff to this territory have been in demand, especially for screened sizes, and this is likely to continue well into January.

Pocahontas and New River remains in short supply at Hampton Roads. Car supply is erratic, but with most of the agencies prepared sizes are moving west rather more heavily than run of mine is reaching Tidewater. Shipments on contract are being made with fair regularity, but for spot shipment there is surprisingly little tonnage available, and correspondingly there seems no strong inquiry for the smokeless coals here in cargo lots. For Inland delivery, in restricted tonnages, there is an improving demand which is reflected in higher prices from week to week.

While the shortage of anthracite is almost a determining factor in the present bituminous market, yet the shortage of cars on the originating roads continues to be a serious consideration. Much more steam coal is being produced than would be necessary for the industries on their present basis and as soon as anthracite begins to flow in better volume it is probable that the change will be promptly reflected in spot quotations for all the coals that reach this territory via the all-rail route.

Cincinnati Gateway

Holidays Add Their Impetus to Upturn Of the Market

Railways Have Been Able to Clear Congestion Points of Most of Their Clutter of Cars but Empties Are Slow in Returning.

With production held at a low ebb because of the usual holiday lay-offs and with a small amount of free coal moving there has been quite a scramble for that which could be picked up as it passes through "the neck of the bottle" and another upturn of 25c.@ 50c. a ton has been the net result. So far as actual sales are concerned the steam grades are now practically on the same basis as gas and by-product coals.

The L. & N. is again allowing free movement through this gateway and claims to have its car accumulations pretty well cleared away. The N. & W. is said to be in better shape than for months, while the C. & O. seems to be neither better nor worse. The clearing of the congestion at Toledo is always a big help to this market, and, right now the Pere Marquette is said to be the only line that is clogged.

CINCINNATI

The volume of business for the holiday season has been rather surprising and would indicate that the hand-to-mouth process of supply this year will permit of no slowing up. Domestic coals have been in excellent demand and even with a large number of mines turning to this make it does not seem possible to keep pace with the demand. Good Kentucky block had no difficulty in bringing $7 while better grades of West Virginia were being quoted at $6.50@$7.

The smokeless situation has developed into an acute shortage. Chicago buyers and those of the Inland territory have been offering local jobbers a price that permits of an $8 bid for lump and egg, but little or no tonnage to be had at those fancy figures. Sales agents have not deviated from the $6-price, top and bottom, for everything from screening to lump, but with the narrowing of the shipments west their proratings have been smaller than for months. Little or no Dry Fork or New River is coming on the market now.

HIGH-VOLATILE FIELDS

Kanawha

On the eve of the Christas holidays the transportation situation was worse than it had ever been. The district is getting cars about every tenth day, so that the order directing that an excess of cars be turned over to the C. & O. by Western roads is not helping matters any after all, making it apparent that deficient motive power has much to do with the situation. The shortage of cars in conjunction with a somewhat heavier demand has stimulated prices.

Logan and Thacker

While the Logan region is suffering from a shortage of loading equipment many of the mines are able to continue operation since much coal is being stored. Increased demand in some quarters meant nothing to producers since they had no transportation facilities with which to increase shipments.

Mines in the Kenova-Thacker region are producing on a somewhat larger scale owing to a better car supply on the N. & W., yet the transportation facilities on that road preclude loadings in excess of 50 per cent of potential capacity.

Northeastern Kentucky

A slight improvement in the car supply does not permit the mines to produce more than 30 per cent or somewhat in excess of 110,000 tons a week. Indeed, the output hardly more than suffices producers to take care of standing orders. Retailers are actively in the market so that domestic is in prime demand.

LOW-VOLATILE FIELDS

New River and the Gulf

That part of the New River region dependent upon the C. & O. for a car supply is having an extremely limited output owing to inability to secure cars. Mines have been reduced to about one day's work a week so that as the year came to an end production was on a smaller scale than it had been at any time during that period, and when the demand was larger than it had been for some time, owing to increased consumption at Tidewater and in Inland East markets. Not only a scarcity of cars but deficient motive power were factors in retarding production.

The Virginian is able to furnish Gulf mines a somewhat better car supply and to get cars back to the mines more promptly since virtually all the coal is being shipped to Tidewater and Eastern markets. Gulf mines are producing at the rate of about 35 per cent of potential capacity.

Pocahontas and Tug River

The advent of the holiday season found the Pocahontas region producing more coal than during the earlier part of December, output being not far short of 300,000 tons a week. The greater part of the coal is for Eastern delivery, though Western movement has been increased to a small extent. Western shipments are limited owing to the small amount of equipment coming from the West and also owing to the limited ability of the N. & W. to handle coal destined west.

Much difficulty is experienced in getting Tug River coal through to Western markets. Then, too, there are not so many cars coming from Western connections. There is little spot coal available.

Coke

BUFFALO

Coke has about given out. The shortage is said to be on account of the poor car supply and as that is not improving now the coke consumer will have to wait. A little of it can be used to advantage with some fine anthracite, but so can soft coal in lumps, so the supply of substitutes is not cut off yet.

CONNELLSVILLE

Demand for coke for domestic distribution has continued, but there has not been much turnover in the market as the previous buying had absorbed all floating supplies. A new development is a bulge in demand for domestic coke from the West.

The demand, if it promised to continue merely for a few weeks, would justify the blowing in of many additional ovens, but operators in the main are quite indisposed to put on more ovens, being very doubtful as to car supply, while there is the fresh complication that sending so many cars east with coke, when the same cars were previously engaged in making short round trips to blast furnaces, may operate to decrease the total of car placements.

As high as $9.50 has been paid for coke for domestic distribution. Some operators have willingly sold at this price, while others are disposed to take care of the regular furnace trade, which cannot afford to pay any such price. It is understood that some first-quarter contracts have been made at $7@$7.50 as an accommodation to furnaces.

The *Courier* reports production during the week ended Dec. 23 at 123,810 tons by the furnace ovens, and 80,720 tons by the merchant ovens, a total of 204,530 tons, a decrease of 4 080 tons.

UNIONTOWN

Continued celebration of Christmas holidays as "wet" and bloody as any during pre-prohibition days cut sharply into the production of the Connellsville coal and coke region during last week. The restricted production came at a time when the coke market especially is very active and a firm demand also arising for coal, principally from railroad interests.

The coke situation at the closing of the year is without parallel in the trade. At a time when some blast furnaces were attempting to negotiate contracts to extend for the first three months of 1923 there suddenly appeared in the market an entirely new buyer for Connellsville coke, originating from the shortage of anthracite. Production was just being about sufficient to supply the demands of blast furnaces in operation and active price debate has ensued, with the custom coal interests leading the way. Some blast furnace interests have intimated that unless lower prices become available they will be forced to bank or blow out.

With the exception of inquiries for railroad fuel there is no concerted buying movement for bituminous coal. Scattered sales are made at $3@$3.25 for steam and $3.50@$4 for byproduct.

News Items From Field and Trade

ARKANSAS

The sale of the property of the **Arkansas Anthracite Coal Co.** near Fort Smith has been postponed to March 23.

COLORADO

Rumor has it that No. 3 mine of the **Big Creek Coal Co.**, near Kirksville, is to shut down indefinitely.

A. T. Hawkyard, P. J. Nusbaum, S. Blixt and others have incorporated **The Hub Coal Mining Co.**, of Montrose; capital, $50,000.

CONNECTICUT

Vincent Brothers Co., coal dealers, Bridgeport, recently increased their capital stock from $50,000 to $100,000.

ILLINOIS

Officers of the Central Illinois Coal Operators' Association have been elected as follows: President, H. C. Adams, Chicago (re-elected); George Soloman, Springfield, vice-president; R. I. Wilcoxson, Springfield, secretary-treasurer; Dan Clark, Springfield, commissioner. The following members were elected to the executive board: W. H. Leland, Chicago; D. A. Watson, Springfield; A. J. Moorshead, Chicago; C. W. Argest, Taylorville, and Forrest File, Decatur.

James Higgins, Chillicothe, has leased the Oscar Carlson farm, two miles south of Mineral, and has begun mining operations. This is another new mine for Bureau County.

The Bucyrus Co., South Milwaukee, Wis., announces the addition to its sales force of **John J. Gault**. Mr. Gault has had many years' experience as construction and locating engineer, having been assistant engineer on the Chicago & Northwestern, engineer maintenance of way on the Chicago & Alton, construction engineer for the United Fruit Co., and assistant engineer on the Chicago, Milwaukee & St. Paul. His last connection was with the International Harvester Co. as locating engineer on a railroad project. He will be attached to the Chicago office of the Bucyrus Co.

The Quartermaster Supply Officer at Chicago has called for **bids for coal supplies** as follows: For use at Columbus Barracks, Ohio, 4,700 tons run-of-mine, 1,300 tons over 2-in. screen; for use at Erie, Pa., 550 tons slack, 200 tons over 2 in.; for use at Fort Benjamin Harrison, Ind., 3,000 tons over 2 in., 500 tons run-of-mine; for use at Dayton, Ohio, 3,000 tons run-of-mine; for use at Fort Thomas, Ky., 1,200 tons over 2 in., 500 tons run-of-mine; for use at Jefferson Barracks, Mo., 5,000 tons over 2 in.; for use at Rock Island, Ill., 358 tons over 2 in.; for use at Selfridge, Mich., 1,000 tons over 2 in., 278 tons run-of-mine; for use at Fort Crook, Neb., 1,300 tons over 2 in.; for use at Des Moines, Iowa, 1,200 tons over 2 in.; for use at Omaha, Neb., 150 tons over 2 in.; for use at Fort Riley, Kan., 4,400 tons over 2 in., 626 tons run-of-mine; for use at Fort Robinson, Neb, 300 tons over 2 in. Bids will be opened at Chicago, Jan. 16.

The Willis Coal & Mining Co., of St. Louis, has given orders to **close down its mine at Willisville**, known as the "old mine," and all machinery, equipment, track, etc., will be immediately taken out of the mine. The order was made by Krause Bros., of St. Louis, large stockholders in the company. The mine is one of the oldest mines in that end of the state and for years has supplied large contracts to the Mobile & Ohio R.R., on which road it is located and by which it is served. The mine employed about 200 men.

The finishing touches are now being made on the **new three-story brick and concrete office building of the O'Gara Coal Co.** at Harrisburg. On the third floor of the building is a large and spacious assembly and reception hall to be used for social events. There also are two private bedrooms on this floor equipped with private bath and telephones to be used by officials of the company from Chicago, who are frequently in Harrisburg.

S. H. Wright, of the Chicago office of the Chicago, Wilmington & Franklin Coal Co., has returned after spending a short visit at the company's mines near Herrin.

James Forester, superintendent of the Paradise Coal Co., Du Quoin, recently spent several days on business with his firm in Chicago.

Edwin L. King has been appointed district sales manager of the **Reading Steel Casting Co., Inc.**, with headquarters in Chicago. He succeeds M. L. Chase, who resigned.

An accident at No. 11 mine of the Old Ben Coal Corporation at Christopher, Dec. 19, sent nineteen men to a hospital. The cage got out of control and dropped with twenty men to the bottom. One man jumped to safety just before the cage hit the bottom, the others sustained broken bones and internal injuries. The company immediately sent out a call to surrounding towns for doctors and other medical assistance. A special train was sent over the C. B. & Q. Railroad to the mine to take the injured to the Harrell Hospital, Christopher.

A. S. Austin, Sr., and A. S. Austin, Jr., both of Milwaukee, Wis., were in Du Quoin recently preparing to **open the Kanawha Fuel Co. mine there.** The company is headed by the former, while the younger Austin is superintendent of the mine. The pumps have again been started and coal will be hoisted just as soon as possible. The company operates under the name of the Old Abe Mining Co., DuQuoin, with the sales offices as Kanawha Fuel Co., Milwaukee, Wis.

A. W. Dix, of Buda, and **Edward Otis**, of Sheffield, have **purchased the Rollins mine,** three miles west of Sheffield. The property consists of 40 surface acres and 30 acres of virgin coal with buildings and mining equipment. This mine has been in operation for several years and during the last two years has been operated by Lamb and Pollack. About half of the coal is consumed locally, the balance being shipped. The property is now operated by C. M. Mapes and two associates. Mr. Mapes had charge of this mine during the war when it was owned at Spring Valley, Ill. There is a 4½-ft. vein of coal at a depth of about 60 ft. The roof is considered first class and the water problem has not bothered since the first year the mine was operated.

The Grant Coal Co., Pekin, has been incorporated with capital of $25,000. The incorporators are T. W. Karstedt, Hugh Kelly, Walter Grant, Fred Hebhardt, William Grant, Jr., David Grant and Albert Hoff.

The Bishop Hamlin Coal Co., Chicago, has been incorporated with capital of $50,000 and 1,000 shares of no par value, to deal in coal, coke, wood, oil and other fuels. The incorporators are J. Edward Bishop, Fred T. Hamlin and Francis H. Uriell.

The Shuler Coal Co. expects to begin shipping coal from the new mine south of Alpha about Jan. 15. The shaft is 225 ft. deep. The company's new office building is finished, the excavation for the track scales is complete, the truck and wagon scales have been installed and grading for the switch from the main line of the Burlington is done. The machine shop is nearly ready.

John Burpaugh, of Peoria, and associates plan the development of a coal field covering 3,000 acres in the southern part of Knox County, about 20 miles south of Galesburg. The field itself extends southeast from the new Burlington Lake to a point near DeLong. It is said that this field is underlaid with a 5-ft. vein of coal within 100 ft. of the surface. Coal tests are now being made. What is known as vein No. 2 of the Illinois series is a surface vein in that section of Knox County and has been mined by stripping. It is thought that at a depth of 100 ft. the Illinois vein No. 1 would be reached. In some parts of Illinois this coal is being mined extensively and the coal is of good quality.

The Tovey Mine No. 8, near Taylorville, broke all records for hoisting coal when 4,750 tons were raised on a recent day just before Christmas. The men at the mine say that they have an ambition to hoist 5,000 tons in one day.

INDIANA

Latest reports from local unions in Indiana assure the retention in office of the present officers and members of the executive board of District No. 11, United Mine Workers. The incumbents were running from two to three to one ahead of their competitors.

Francisco Mine No. 2, at Princeton, was struck because the men, who are being paid by the day, wish the company to pay according to tonnage. To do this it would be necessary for the company to put in scales. A representative of the company said that until the mine is completed and the tipple erected, the company does not wish to put in scales, which would be expensive and would have to be changed later. He said the mine had been operating day and night shifts, that a steel tipple, which would cost approximately $75,000, was ready for shipment to the mine, but in view of the strike it was probable the company would let the mine remain idle until April and send the contracts for coal elsewhere.

Among the measures to be supported by the **Indiana Retail Coal Merchants' Association** at the next session of the Legislature will be one to prevent unscrupulous dealers from misrepresenting the kinds and grades of coal they sell to consumers. It also is understood that the association will favor a larger appropriation for the state weights and measures department. J. H. Panabaker, of Kokomo, is president of the association; W. A. Dalton, of Gary, is first vice-president; Ray Macey, of Indianapolis, second vice-president; George E. Bruner, of Kokomo, treasurer, and R. R. Yeagley, of Indianapolis, secretary. The legislative committee is composed of Mr. Macey, Fred D. Stilz and C. F. Meyer, Jr., of Indianapolis; C. D. Cook, of Columbus, and C. C. Cochran, of Atlanta.

The Archer Coal Co. has been organized in Fort Wayne to deal in fuels of all kinds. The company has a capital stock of $10,000 and the organizers are L. H. Dunten, John Cashman and John Dehner, all of Fort Wayne.

Illegal shots were given as the **cause of an explosion** in December, in the **No. 8 mine of the J. K. Dering Coal Co.** near Clinton which killed William Davis, a shotfirer, at work near the shaft. The cages were damaged some by the force of the blast, but production was resumed after three days. This is an old mine, the shaft of which has been sunk to the No. 3 vein. Development in that seam is just well started and the mine's output is about 300 tons a day.

IOWA

M. F. Riordon, of Melrose, has been elected **president of the Gold Goose Coal & Mining Co.**, of Albia, to fill the vacancy caused by the death of L. T. Richmond.

The Sioux City Coal Exchange is trying to work out a method of licensing retail dealers so as to eliminate "snow birds" and dealers who cannot prove they are substantial.

The **Norwood-White Coal Co.** is getting coal from its new mine recently opened up at Herrold. This is a small producer and is electrically equipped. It is understood that additional operations are contemplated.

J. L. Hartstorn, Knoxville, has leased forty acres of coal land on the Elias Stierwald farm, one mile north of Flagler and now has about 50 ft. of entryway driven back into the vein which averages about 6 ft. in thickness. The location of the mine is near the Knoxville and Pella Road and the coal is equal to that found south of Knoxville, where the Andersonville and Pershing mines are in operation.

KANSAS

Large leases of strip coal land near Chetopa have been made by R. L. Hillegas to the **Cherokee Coal & Coke Co.**, of Kansas City. Deep shaft mining is possible on part of the tract.

Charging that miners working in the **Kansas State Prison mines have been removing coal from under his farm, John McCarthy**, a farmer living near Lansing, filed suit Dec. 20, 1922, against the board of directors of the prison, and M. F. Amrine, warden, for $6,000. Pending settlement of the suit, McCarthy obtained a temporary restraining order to prevent the removal of props and pillars from the tunnels he alleges are under his land, thus permitting cave-ins to obliterate signs of any operations.

At a dinner following a state first aid tournament at Girard, in December, **Ira Clemens** called attention to the fact that **since Oct. 1 there have been no strikes** in the southeastern Kansas coal district. Before this year the average was twenty-seven and one-half a month, he said. Mr. Clemens said that approximately **8,000 tons of coal is displaced each day by oil** in the district supplied by the Kansas field. He attributed the situation to public distrust of the ability of the mines to deliver because of past strikes and the threat of another strike April 1, and to high freight rates on Kansas coal. Mr. Clemens assured the miners that the use of mining machines would increase Kansas production without decreasing the number of men employed. First prize in the first-aid contest was won by a team composed of miners from various mines in the vicinity of Mulberry. Seventeen teams were entered.

KENTUCKY

The retail coal trade of the state along with all truck owners, farmers and trucking interests, has started a movement **to enjoin the state from enforcement of the Bright light load law,** which prohibits use of certain surfaced roads from Dec. 15 to April 15 except with specified weights and tire widths, which, it is asserted, prevents larger trucks from operating except with very limited loads. This, they say, would result in overloading of small trucks and more damage to roads.

A. C. Lackey, of Nashville, Tenn., and H. H. McBratney, of Louisville, Ky., president and vice-president of the **Dixie Fuel Co.,** jobbers with offices at Nashville, Louisville and Chicago, **have just closed a deal for the Phoenix Coal Co.,** a 35- to 40-car a day mine at Drakesboro, on the Owensboro & Nashville division of the L. & N. The name of the Phoenix company will be changed to the Phoenix Coal Mining Co., with A. C. Lackey as president and H. H. McBratney as secretary-treasurer. The Dixie Fuel Co. will be sales agents. The same interests own the Douglas Coal Mining Co., which was the White Coal Mining Co. prior to last August. Former owners of the Phoenix Coal Co. were James B. Torbert, P. D. Houston and Wilbur Nelson.

MARYLAND

Acting on the appeal of twelve striking miners from the decision of Justice John R. Workman, of Frostburg, who ordered them to vacate houses owned by the Consolidation Coal Co., Judge Albert A. Doud affirmed the action of the magistrate and **directed the issuance of a writ of restitution** of Sheriff Peter McFarland to restore possession of the premises to the Consolidation company and to assess the costs to the defendants. The houses are located at Eckhart, Zihlman and Hoffman. The tenants are strikers who refused to work and in most instances are back in their rent, being nominal amounts of from $2 to $3 a month. The company wants possession of the houses for men who desire to work in the mines.

MASSACHUSETTS

The Sanford Riley Stoker Co., of Worcester, has acquired the business of the **Ground Coal Engineering Co.,** of Chicago, which was incorporated in Massachusetts Dec. 23 as the Ground Coal Engineering Corporation, with headquarters in Worcester. R. Sanford Riley, of Worcester, is the president of the new corporation; Milton W. Arrowood, of Chicago, is vice-president; F. H. Daniels, of Worcester, treasurer, and David K. Beach, of Worcester, clerk. The company has a capital of $200,000 preferred stock and 1,000 shares of common stock of no par value.

MINNESOTA

C. P. White, Federal Fuel Distributor for the Northwest, closed his office in St. Paul, Dec. 30, and returned to Washington.

MISSOURI

Dickinson Bros., of Kansas City, are preparing to mine coal on a large scale at their new pit at Eve.

D. C. Crane, of Springfield, has opened up a strip mine near Creighton.

With the opening of the **Perry-Rice Coal Co.** mine at Rayville there is a boom on. There is an acute housing shortage developing as the coal tonnage increases.

In the last sixty days of 1922 upward of **15 new coal mining companies** were either opening or arranging to open that many new coal mines. Most of these are strip mines, but there are several small shafts. Tonnage from all of these mines will be small on account of the 3-ft. vein. These mines are to be opened because of the high prices of Kansas and Illinois coals. If this increase in Missouri coal continues a great part of the state will be able to get along without Kansas or Illinois fuels. Rapid strides have been made in this direction during the last year. Nearly all these new openings are non-union.

The Bonanza Coal Co. has changed its name to the Higginsville Coal Mining Co. with Nelson B. Good, of Kansas City, and H. C. Odel, of Potter, as principals; capital $15,000.

The **new mine** of the **Mosby Coal Co.,** near Mosby, is now hoisting coal. The J. E. Drysdale Coal Co., of Davenport, Iowa, has leases on 3,000 acres and is making test holes.

Coal-lease speculation is rife since the Gose & Austin Mining Co. hit a 3-ft. seam of good soft coal at 140 ft. near Spickard, with prospects of a 6-ft. seam 50 ft. further down.

NEW YORK

The Timken Roller Bearing Service & Sales Co. began operation Jan. 1, 1923. This new company adds the final link to the chain of complete control which the Timken Roller Bearing Co. exercises over its product from the raw material to the sale and maintenance of the finished bearing. Thirty-two direct factory branches are maintained.

The recapitalization plan of Burns Bros. has been formally approved by the directors. Under the new plan, by the retirement of the preferred and preference stock, there will be a saving from disbursements annually sufficient to give present stockholders a larger dividend, without taking any larger amount from current earnings. Earnings of Burns Bros. at present are of a very satisfactory character and arrangements were made to provide for additional stock, which may be distributed to stockholders as a stock dividend, when conditions warrant. Provisions also were made for further expansion.

A reorganization of the general manufacturing department of the General Electric Co. took place Jan. 1, 1923. H. F. T. Erben, heretofore manager of the Schenectady Works, becomes vice-chairman of the manufacturing committee and ranking a member of the general manufacturing staff. Charles E. Eveleth, who has been serving since September 1st as assistant works manager under Mr. Erben, is to succeed Mr. Erben as manager of the Schenectady plant. Mr. Eveleth will become works manager. J. A. Smith will continue as general superintendent and in the absence of Mr. Eveleth will be in charge of the works. The membership of the manufacturing committee and the appointment of a subcommittee to be known as a committee on appropriations, is also announced. The general manufacturing department will be as follows: H. F. T. Erben, vice-chairman of manufacturing committee and ranking member of the staff; J. T. Broderick, secretary of the manufacturing committee; L. G. Banker, general purchasing agent; M. C. Fitzgerald, manager of transportation department; W. C. Fish, manufacturing engineer; W. B. Curtiss, supervisor of production; G. S. Maxwell, supervisor of costs; E. Z. Steezer, supervisor of industrial relations.

The Rochester & Pittsburgh Coal & Iron Co., of Buffalo, is again operating its Walston mine in Jefferson County, Pa., which had been idle for some years. With a force of 40 miners, which is in prospect soon, the output will come up to about 200 tons a day.

The Lake season closed with the loss of only about 1,200 tons of coal in the upper Lakes' trade, which amount was jettisoned from the Buffalo steamer, J. J. H. Brown, lately ashore on Bois Blanc Island, in Lake Huron, near the Straits of Mackinaw. No vessels of account were lost and the loss of freight was merely small amounts from a certain small number of cargoes. This is a record breaker all around.

OHIO

Roy Heyser has accepted the position of manager of the Cincinnati office of the **Morrow Callahan Coal Co.** Mr. Heyser has resigned his position with the Semet-Solvay Co. to take on this new work. He has been located in Cincinnati for several years as fuel purchasing agent for Semet-Solvay and prior to that was with Eaton Rhodes.

Lee Hall has been re-elected president, **William Roy** vice-president, and **G. W. Savage,** secretary, of the Ohio division of the United Mine Workers of America.

All records of the Pennsylvania coal docks at Sandusky were surpassed during the navigation season just closed. During the 1922 season the Toledo division of the Pennsylvania system handled into Sandusky and dumped into lake vessels 2,246,800 tons of coal, or more than 49.5 per cent of the total amount of coal handled at Lake Erie ports by the Pennsylvania R.R. Of this amount 265,807 tons represented cargo coal, while the remainder was bunker coal. The volume of cargo coal dumped by the system at Sandusky represented approximately 41.1 per cent of the total amount of lake coal handled, or more than the combined total dumpings of Cleveland, Ashtabula and Erie, points under the jurisdiction of the central region.

OKLAHOMA

The **Red Oak Coal Co.** has been incorporated for $200,000 by Ray Morgan, James Hilling and V. Davis.

With the new acreage acquired around Edna by the **Central Coal & Coke Co.** it is estimated that close to **$175,000 has been spent in this field** for coal leases in the past six months. In the territory west of Welch the leases are going to local Oklahoma coal operators.

PENNSYLVANIA

Alberto Benturini, a coal operator of Allegheny township, Westmoreland County, was recently awarded a verdict of $4,408 in Federal District Court over A. N. Johnson, cashier of the First National Bank of Freeport, as **compensation for alleged breach of agreement** in connection with a large coal transaction. Benturini, who sued for $75,000 damages, charged that in May, 1918, he agreed to sell the output of his mine to Johnson, but that numerous deductions from the selling price caused him to lose heavily.

The Eastern Fuel Co., with main offices in the Frick Building, Pittsburgh, has opened offices in the Heymann Building, Philadelphia, temporarily in charge of C. W. Stone, of the Pittsburgh office. James F. Whelan has been promoted to the position of resident manager of the New York office, Frank W. Morton, formerly with the Underhill Coal Co. and the Tuttle Corporation, has joined the sales force of the main office.

Under the provisions of a lease, executed Sept. 29 last, and filed Dec. 26, the **Fair Coal Co. agrees to pay a royalty of $1 a ton** for all coal mined from a forty-seven acre tract in the Second Ward of Scranton, which for years has been known as the P. C. Griffin tract. Included in the lease are three separate tracts, known as the Dean, Winton and Livey tracts.

The Glen Alden Coal Co. has declared its first dividend since the company was organized a year ago. The dividend amounts to $1.50 for each share of stock. The Glen Alden Company was formed when the coal and railroad interests of the Delaware, Lackawanna & Western were separated.

State charters were issued recently to the following companies mining bituminous coal in Pennsylvania: **The Fire Coal Co.,** Dunlevy, with a capital stock of $5,000, J. H. Dunlevy, Pittsburgh, is treasurer, and the purpose of the corporation is mining, shipping, buying and selling coal and other minerals. The incorporators are Thomas T. Dunlevy, Pittsburgh; Etta N. Dunlevy, Dunlevy. **Morningstar-Schnars Coal Co.,** Philipsburg; capital, $12,000; S. Reed Morningstar, Philipsburg, treasurer, and an incorporator, the other incorporators being R. R. Schnars, Hawk Run, and H. Dixon, Hawk Run. Purpose: Mining, buying and selling coal and the products thereof. **Beadling Coal & Coke Co.,** Pittsburgh; $5,000; W. A. Beadling, Pittsburgh (treasurer); James Beadling, Beaver Falls, and William H. Beadling, Pittsburgh, are the incorporators. **White Oak Coal Mining Co.,** Johnstown; $50,000; Gordon C. Hutchison, Johnstown, treasurer. The treasurer, Thomas B. Allen, Nanty-Glo, and Toner S. Yoder Nanty-Glo are incorporators The purpose of the company is mining, selling and shipping coal and other minerals and the manufacture of coke and byproducts.

The Mid Valley Coal, Upper Lehigh Coal, Maryland Coal, Raven Run Colliery, Gerardville Mining and **Lykens Valley Coal companies,** all properties of the Wentz interests of Philadelphia, have been consolidated under the name of the Hazelbrook Coal Co., with a capital of $7,000,000. An official said the object of the merger was to facilitate management.

The Bertha Coal Co., Pittsburgh, is receiving bids for new shaker screen machinery and equipment which the company plans to install and have in operation by next April at the Bertha Mine, Dinsmore, Pa., on the Pan Handle; the Louise Mine, Louise, W. Va., on the Pittsburgh & West Virginia Ry.; the Gould Mine, Wilson, on the Pennsylvania R.R., and Rachel Mine, Downs, W. Va., on the B. & O. The new equipment will include loading booms and picking tables of the most modern type.

The Commission for the Reorganization of the State Government has sent a summary of legislation proposed, as the result of a year's study of the needs of the Commonwealth, to members of the 1923 Legislature. Among the proposals is one that **would combine the two mine inspectors' examination boards** into one board. The commission's summary contains the following paragraph: "Under the present law there are two mine inspectors' examining boards appointed by the Governor, one board for the examination of inspectors in the bituminous region and one for the examination of inspectors in the anthracite region. Under this system the mine inspectors seem entirely free from co-operation with the Department of Mines. The bill submitted provides for the consolidation of these two boards into one board composed of eight citizens to be appointed by the chief of the Department of Mines. The chief of the department is also an ex-officio member, giving the board nine members. By providing for the appointment in this manner and making the chief of the department a member of the board, it is believed that these inspectors will be tied up with the department more closely and strengthen the executive authority of that department."

SOUTH CAROLINA

The Pee Dee Coal Co. has been incorporated at Florence, and has elected the following officers: President-treasurer, E. K. Turner; vice-president-secretary, G. H. Turner.

TENNESSEE

The Independent Fuel Co. has been incorporated at Nashville by S. R. Hampton, C. B. Roberts and Cecil B. Simms.

UTAH

Announcement has been made by Wiggington E. Creed of final organization of a $20,000,000 corporation known as the **Columbia Steel Corporation**, to consolidate the plants of the Columbia Steel Co. in Pittsburg, Cal., and Portland, Ore., and the Utah Coal & Coke Co., of Utah. Construction of a large blast furnace between Provo and Springville, Utah, is promised in the near future. The plan of the company is to process steel on the Pacific Coast in as great an amount as possible, to save water and rail tariffs on this product from the East. Mr. Creed is president of the corporation.

About 250 acres of coal land in Carbon County **has been redeemed** from the delinquent tax sale in 1917 **by the Carbon Fuel Co.** The company paid to the state treasurer $6,812.62, representing the amount of the tax and the delinquent penalties and costs.

A. D. Pierson, formerly with the Utah Fuel Co., has been appointed railroad fuel agent for the U. S. Fuel Co., Salt Lake City. Mr. Pierson is regarded as one of the best informed coal men in the state.

VIRGINIA

Clyde Smith has leased coal mine properties at Pulaski, and will develop them at once.

The Richmond Coal Mining Co., of Richmond, has been incorporated for $25,000 with Sterling R. Jones as president and Sam Marcus as secretary.

The Jewell Ridge Coal Corporation, of Tazewell, has announced that it will increase its capital to $500,000.

WEST VIRGINIA

Manufacture of smokeless powder is to be undertaken on a large scale by the Main Island Creek Coal Co. Tests conducted at the Omar mines of the company have been so satisfactory that the company will build a powder plant at Omar. At the outset the company will manufacture powder only for use in its own mines, but after a time will place it in the general market.

The Ramona Coal Co., with a capital of $100,000, has been incorporated at Huntington by C. T. Egri, M. R. Tetman and E. M. Jones.

The Elkins Smokeless Coal Co., of Elkins, has been incorporated with a capital stock of $750,000. The incorporators are C. A. Parvin, of Chicago, and J. F. Bridwell and C. E. Williamson, both of Charleston.

Facilities for handling coal for river shipment on a large scale are to be provided by the **Philadelphia & Cleveland Coal Co.** at Huntington, through the erection of a large river tipple, the company having acquired 23 acres for the plant. It will be necessary to construct about 2,000 ft. of trackage from the C. & O. siding at the Camp Glass plant to the river tipple. The cost will be approximately $1,000,000. This will enable the company to handle twice as much coal as any other equipment in Huntington, but the company does not propose to restrict the use of the equipment to its own coal, having indicated that other coal companies would be permitted to use the tipple in loading coal for river shipment if they so desire.

In the case of the **Milligan Coal Co. vs. the Harvey Fork Coal Co.**, of Clay, tried in the Circuit Court of Kanawha County, Judge A. P. Hudson handed down a decision in favor of the plaintiff. The defendant admitted it was to purchase certain property of the plaintiff in Clay County for the sum of $85,000 but that there was to be no money passed at the time the defendant entered upon the possession of the property as a part of the agreement. The plaintiff in the case put forth the claim that the defendant had paid nothing for the property and had taken possession for the purpose of getting the property in shape to operate, but had failed to complete its part of the contract.

Certificates of increase in capital stock have been filed by the **MacAlpin Coal Co.** The company's stock is to be increased from 4,000 shares with par of $100 to 8,000 shares at the same value.

Teddy Arunski, Pennsylvania miner, has been found guilty by a jury of conspiring to incite striking miners to attack the Clifton Coal Co. plant during the strike last July in the Clintonville field.

The Vanbail Coal Co. has changed its general headquarters from Huntington to Charleston.

The Morgart Coal & Coke Co. and the **Carbon Hill Collieries Co.** have been dissolved as corporations and have surrendered their charters.

The Mandt Mining Co. has changed its name to the **Elrod Fuel Co.**

Foreign coal corporations recently authorized to do business in West Virginia include the **Blue Ridge Mountain Coal & Coke Co.**, of which Joseph Washington, of Cresson, Pa., is secretary; the **Barbour-O'Brien Coal Corporation**, of Delaware, of which Joseph Washington is also secretary, and the **Stevens Coal Co.**, incorporated under the laws of Delaware with offices on the North Side in Pittsburgh, Pa.

The Central Coal Mining Co., of Wheeling, is reported to have acquired 800 acres of coal land that lies close to its present properties at Wheeling. The present output of the company is 1,000 bushels of coal a week and it contemplates developing its new properties until this output is pushed to 2,000 bushels a week.

A jury in the criminal court of Harrison County found **three women guilty of participation in a riot** June 23 at Glady's Stop, in Harrison County, when a number of deputy sheriffs and non-union miners workers on their way to the Lewis mine of the Hudson Coal Co. were attacked by a mob of strikers. The jury recommended mercy. The defendants were Mrs. Daisy Simonetti, Mrs. Angelina Bassil and Mrs. Angelina Modo, the first named being the mother of Larry Simonetti, also convicted on the same charge at the same term of court. Before the trial of the three defendants began, their counsel moved for a change of venue, but the motion was denied by the court.

The Bell Creek By-Products Co. has been incorporated at Montgomery by J. E. Wilkinson, G. C. Humphreys and W. H. Thomas, with a capitalization of $50,000.

Engineers have been engaged by the **Slaters Creek Coal Co.**, of Charleston, to make surveys for large development of coal lands near that city.

F. S. Landstreet, Jr., M. F. Breslin and Herman Redd have incorporated the **Eldes Junior Coal Co.**, at Huntington, W. Va., with a capital stock of $100,000.

The Midland Smokeless Coal Co., which was recently incorporated at Ronceverte with a capital stock of $50,000, has perfected an organization with the election of the following officers: President, C. H. Thompson; vice-president, L. E. McClung; secretary-manager, B. M. Higginbotham. The company will soon install the necessary mining machinery to develop 800 acres of coal mining land.

Progress is being made by the **C. & O. in determining upon the best route into the Greenbrier County coal field**, surveyors now being at work in this territory with a view to definitely settling the question of the best method of reaching the large mines which have been opened in Greenbrier County within the last year. Although the junction point with the main line has not been decided upon, it seems to be generally accepted that the branch into the Greenbrier field will be started at Ronceverte, in which event it will become necessary to increase yard and shop facilities in order to take care of the increased traffic.

The Chafin-Jones-Heatherman Coal Co., operating in the Logan field, has not only been able to reach the production goal set ten months ago, when this company opened its mine, but this concern is planning now to double the capacity of its mines on Peach Creek. The company completed work on its tipple and finished driving several openings in the Alma seam on Feb. 1 of the present year, announcing at that time that it expected to reach a production of 1,000 tons per day. Since beginning operations the new company has extended its track up Peach Creek for nearly a mile and has made additional openings. Foundations have been built for another tipple and arrangements are being made to construct a 610 ft. conveyor from the tipple to the headhouse. The company began business with 41 miners' houses, to which have been added 25, and it is now proposed to build 50 more houses in the near future. Officers of the company are Don Chafin, president; W. T. Jones, vice president; Dr. K. J. Heatherman, general manager.

WISCONSIN

The State Fuel Administrators of Wisconsin, Minnesota, North Dakota and South Dakota wired C. E. Spens Dec. 19 urging priority order for shipment of 250 cars of anthracite daily to those states via ferry line routes to prevent suffering in the Northwest.

The Arpin Process Coke Co., of Wisconsin Rapids has been chartered, with these shareholders: J. P. Arpin, Charlotte C. Arpin and Paul H. Arpin.

CANADA

Frank T. Malone, formerly with the Century Coal & Coke Co., Ltd., Toronto, has severed his connection with that firm and **has organized the International Coal Co.**, with office on Bay Street, Toronto. The company will engage in the wholesale coal business.

Property Commissioner Chisholm, who is the new Fuel Controller in Toronto, is to put into immediate effect a regulation that every citizen must take **25 per cent of substitutes with hard coal.** It is believed that later on the proportion will be 50-50.

So bitterly is the United Mine Workers conducting the **strike in the northern Alberta field** that the **James Mulock**, Dominion Minister of Labor, has sent the following **telegram to Robert Livett**, one of the board of the union, who is conducting the strike in the field: "I shall lose no opportunity in condemning the strike as unlawful, and, so far as I can see, unjustifiable, since it appears to have no other purpose than securing a closed shop, an object that menaces alike the freedom of the individual and the welfare of the community. If you and those associated with you persist in maintaining the present situation, I shall most certainly hope to assist in framing some changed method or law that will prevent a recurrence of such an attitude on the part of those assuming to represent labor." There have been a number of outrages in the Edmonton coal field, including stoning and firing at men attempting to go to work in the mines. A number of officials of the union have been arrested and fined, and in one instance a jail sentence was given. The provincial police have been reinforced.

Alfred Odgers, a fireboss, and **Gilbert McBroon**, a pumpman, in the employ of the Western Fuel Co., were killed recently by an explosion of coal dust in the Wakesiah mine, Nanaimo, B. C.

One man is missing and property damage to an extent estimated at $300,000 as the result of a fire which destroyed the power house of the International Coal & Coke Co. at Coleman, Alta.

Nearly 400 coal mines were in active operation in Canada in 1921, working over an area of 713,000 acres, according to a report issued by the Dominion Bureau of Statistics. Approximately 30,000 men were given employment and the wage bill in 1921 amounted to $42,758,471. The total capital invested in the industry at the close of that year was $176,991,495.

Five new coal mines have been opened up along the Canadian Pacific Railway line from Acme to Drumheller. The coal mined is said to be of excellent quality for domestic use and is expected to aid considerably in relieving any coal shortage this winter.

WASHINGTON, D. C.

Coal or coal products imported from Canada, Spain, Japan and several other countries must pay a customs duty equal to the amount of duty such countries or dependencies impose upon coal and coal products from the United States, according to orders issued by the Treasury Department. This action was taken because of the retaliatory proviso of the coal paragraph of the new tariff act, which admits coal free of duty unless other countries impose a duty on coal from this country. The foreign tariffs on coal which are to be the basis of the countervailing duties to be collected on any coal from such countries imported into the United States, according to the Treasury decision, are:

Australia—Coke, 6s. per ton; coal, free.

British India—Coal, coke and patent fuels, 0.5 rupees per ton.

Canada—Anthracite, free; bituminous slack, such as will pass through a ¾-in. screen, 14c. per ton; bituminous round and run-of-mine, 53c. per ton.

Japan—Coal, free; coke, 5.65 yen per 10,000 kin (kin equals 1⅓ lb.); brick coal or briquets, 10 per cent ad valorem.

French Indo-China—Coal and coke, briquets, etc., 0.12 fr. per 1,000 kilos.

China—Coal 0.27 Haikwan taels per ton, coal briquets, 0.50 Haikwan taels per ton.

Brazil—Coal imported by undertakings manufacturing and supplying gas, 6.814 actual milreis per metric ton; imported by any other private firm or individual, 12.342 milreis; coke, free.

Chile—Coal and coke free; briquets, 3 gold pesos per ton.

Peru—Coal free; coke, 0.20 soles per 100 kilos, plus surtaxes if imported at certain ports.

Spain—Coal, coke, etc., 7.50 pesetas per metric ton.

Uruguay—Coal, 0.05 gold pesos per metric ton.

Duties are to be figured on conversion at current rates of exchange at the time of importation.

Reports to the U. S. Bureau of Mines from manufacturers representing about 90 per cent of the explosives industry in the United States show that **sales during October of black powder and permissibles were slightly below the September record, but sales of dynamite and other high explosives increased somewhat over the previous month.** The reports for October indicate total sales of 793,105 kegs of black powder, 4,692,060 lb. of permissibles, and 18,139,118 lb. of other high explosives. The total amount of explosives manufactured and used in the United States (excluding exports) during the first ten months of 1922 was as follows: Black blasting powder, 4,725,343 kegs; high explosives other than permissibles, 148,515,562 lb.; permissible explosives, 29,788,377 lb. These totals compare with 4,416,848 kegs of black blasting powder in the corresponding months of 1921 and 8,362,994 kegs in the same months of 1920; 129,097,684 lb. of high explosives other than permissibles in the first ten months of 1921 and 185,437,738 in the corresponding period of 1920; 30,564,538 lb. of permissibles in the first ten months of 1921 and 45,116,720 lb. in the same period of 1920. Distribution by uses during the first ten months of 1922 was as follows:

JANUARY TO OCTOBER, 1922

	Black Blasting Powder, Kegs	High Explosives Other Than Permissibles, Lb.	Permissible Explosives, Lb.
Quantity used for:			
Coal mining	3,964,443	16,084,987	27,084,559
Other mining	143,355	58,736,437	1,345,900
Railway and other construction work	244,547	18,156,936	118,862
All other purposes	372,998	55,537,202	1,239,056
Total, first 10 mos., 1922	4,725,343	148,515,562	29,788,377

Traffic News

Rates on coal from Dines, Wyo., to numerous Western points are held to be unreasonable in a tentative report submitted by Interstate Commerce Commission Examiner T. J. Butler. The rates were attacked by the Colony Coal Co.

Complaints have been filed with the I. C. C. alleging that present carrier rates from Lake Michigan docks and from Illinois fields in shipments of coal in carload lots to Wisconsin and Lake Superior points are unjust and unduly prejudicial to Illinois shippers and that the rates to Michigan destinations are unduly preferential to Lake Michigan dock operators. The complaints place the coal rate situation in such a shape that it will be necessary for the I. C. C. to conduct a general investigation of rates on this commodity in the western trunk line territory.

The Illinois Commerce Commission has issued an order directing the Peoria and Pekin Union Railroad Company and the Peoria Railway Terminal Company **to reduce the cost of hauling coal into Peoria by 24c. a ton.** This will effect a saving of $50,000 a year to the people of Peoria. This saving will be effected on actual hauling rates alone. Should it mean that the city will now be able to purchase, through lower rates, coal from their own nearby mines, it will mean a far larger saving. The Peoria Association of Commerce has been active on this reduction for several years. The association is particularly anxious to see local coal used, as much of the coal is now hauled from distant mines. It is believed that the reduction of freight rates on coal transported by the Peoria local terminal railroads will result in more Peoria coal being used in the city.

Obituary

William Stephan, Sr., president of the Stephan Coal Co., of St. Louis, died suddenly on a street car on his way to his office. Heart disease was the cause of his death. Mr. Stephan, who was 67 years old, was born in Germany and at the age of 19 settled in St. Louis, where he had made his home since. He recently returned from a trip abroad with Mrs. Stephan, at that time visiting the scenes of his childhood. He is survived by the widow and two sons, William Stephan, Jr., recently elected president of the Retail Credit Men's Association of St. Louis, and Oscar H. Stephan, both of whom were associated with him in the coal business.

Don H. Bacon, formerly president of the Tennessee Coal & Iron Co., died at his home in St. Augustine, Fla., on Sunday, Dec. 17. He had been ill for about a year. Mr. Bacon had been president of the Minnesota Iron Co. before the United States Steel Corporation was organized.

Dwight R. Higbee, a well known retail coal dealer of Minneapolis, head of the Northern Fuel Co., died at his home Christmas night without warning. He had celebrated the day, and had driven with his family around the city. They returned home, and he complained of not feeling well. Death followed soon after. He had been a resident of the city since 1882.

Publications Received

The Preparation, Transportation and Combustion of Powdered Coal by John Blizzard, Mines Branch, Department of Mines, Ottawa, Canada. Pp. 131; 6x9 in.; illustrated. Describes plants where powdered coal is being used and gives some interesting tests and costs.

Analyses of Kentucky Coals. Bureau of Mines, Washington, D. C. Technical paper 308. Pp. 92; 6x9 in.; tables.

Fusibility of Ash from Coals of the United States, by W. A. Selvig and A. C. Fieldner. Bureau of Mines, Washington, D. C. Bulletin 209. Pp. 119; 6x9 in.; illustrated. Contains tables giving softening temperatures of coal ash from coals of the United States.

Value of Coke, Anthracite and Bituminous Coal for Generating Steam in a Low-Pressure Cast-Iron Boiler, by John Blizzard, James Neil and F. C. Houghton, Bureau of Mines, Washington, D. C. Technical paper 303. Pp. 56; 6x9 in.; illustrated.

Lessons from the Granite Mountain Shaft Fire, Butte, by Daniel Harrington, Bureau of Mines, Washington, D. C. Bulletin 188. Pp. 50; 6x9 in.; illustrated. Describes rescue work at time of mine fire in 1917.

A Study of Explosions of Gaseous Mixtures, by A. P. Kratz and C. Z. Rosecrans. Engineering Experiment Station, University of Illinois, Urbana, Ill. Bulletin No. 133. Pp. 104; 6x9 in.; illustrated. Contains tests on study of the physical phenomena involved in the explosions of various mixtures of illuminating gas and air, including determination of the effect of differently shaped explosion vessels and of turbulence at time of ignition, as well as a study of the heat loss from the burning mass of gas. The bulletin also contains an historical review of the principal researches made in the study of explosions of gaseous mixtures.

Coal-Dust Explosion Tests in the Experimental Mine, 1913 to 1918, Inclusive, by George S. Rice, L. M. Jones, W. L. Egy and H. P. Greenwald. Bureau of Mines, Washington, D. C. Bulletin 167. Pp. 639; 6x9 in.; illustrated.

A Study of Coal Mine Haulage in Illinois, by H. H. Stoek, J. R. Fleming and A. J. Hoskin. Engineering Experiment Station, University of Illinois, Urbana, Ill. Bulletin No. 132. Pp. 136; 6x9 in.; illustrated. Describes evolution of mine haulage and the progress in mine-haulage equipment. Also gives detailed accounts of mine-haulage problems in Illinois, including the handling of cars on shaft bottom, main-line and gathering haulage, underground haulage costs, haulage accidents and accident prevention measures.

Trade Literature

W. A. Jones Foundry & Machine Co., Chicago, Ill., has now ready for distribution its catalog No. 26 on spur-gear speed reducers. This catalog contains technical and practical information, complete descriptive matter and illustrations of typical drives. Dimensions, weights and horsepower ratings for complete speed reduction sets are shown.

Portable Electric Tools and Shop Equipment. The Black & Decker Mfg. Co., Towson Heights, Baltimore, Md. Catalog No. 5. Describes the advantages of design and construction of their portable electric drills, electric screwdriver and socket wrench, post and drill stands, attachments for portable electric drills, electric grinders. Two pages are devoted to telling how to grind drill bits, and the five remaining pages describe their No. 2 lectroflater electric compressor. The book contains 30 pp., is 8 x 11 in. and well illustrated.

Railway Supplies. General Electric Co., Schenectady, N. Y. Catalog 6002. Pp. 505; 8x10 in.; illustrated. Mine locomotives, railway and mine haulage motors, controllers, resistors, switches, protecting devices for mine equipment, trolleys for mine locomotives, incandescent headlights for mine locomotives, cables, rail bonding, clamping ears for mines, are among some of the mining equipment described. The book is indexed for ready reference and is accompanied by a price supplement for estimating purposes only, being subject to change without notice.

Roberts & Schaefer Co., Chicago, Ill., have issued a four-page folder illustrating and describing their **"Perfection" Cone Stove Sand Dryer and Beamer Patent Steam Sand Dryer.** Bulletin 48.

Coming Meetings

American Engineering Council will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northeast Kentucky Coal Association will hold its annual meeting Jan. 23, 1923, at the Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

Engineers' Society of Western Pennsylvania will hold its annual banquet Monday evening, Jan. 22, 1923, at Pittsburgh, Pa. Secretary, K. F. Treschow, Pittsburgh, Pa.

Hazard Coal Operators' Exchange will meet on Jan. 12, 1923, at the Phoenix Hotel, Lexington, Ky. Secretary, R. A. Hord, Lexington, Ky.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, Editor

Volume 23 NEW YORK, THURSDAY, JANUARY 11, 1923 Number 2

Coal Commission Goes Beyond Fact Finding

LAST week was important in the annals of labor history in the bituminous-coal industry. In the Chicago conferences between the United Mine Workers and the operators from all organized bituminous-coal fields three outstanding positions were taken by three strong groups. The outcome of three days' deliberation was the apparent elimination of two of the three.

The conference, it should be understood, was the preliminary round to the negotiations for a scale and contract to cover the period beginning April next. It was concerned with a decision as to how the two parties were to come together for negotiations. The old Central Competitive Field supposedly was scuttled last August in the settlement of the 1922 strike, when a mixed group of small proportions—operators from scattered fields—signed the contract dictated by the union. With the outward semblance of reorganization after the rout of last summer, the operators entered the Chicago conference on Jan. 3 with agreement on one program—district settlements, the battle cry of 1922. When the expected resistance and outright refusal of the miners was again manifested, the operators divided. The plain, unvarnished district plan was buried.

As of old, the operators divided as between the old Central Field and the "outliers." Those who throughout the past have been without the fold, who have never been permitted to enter the council chambers of the "Big Four"—Illinois, Indiana, Ohio and Pittsburgh—fought, and fought hard, for the initiation of a new day—for a national wage policy for the bituminous-coal industry.

Conservatism of the old, old school triumphed over the new thought—for a national wage policy is a new thought for the operators. In our present state of knowledge and experience it is the only way in which there can be district settlements. But with both rejected, and apparently decisively, there remains only the old base for wage making—the Central Competitive Field. Fifteen districts—"diversity of interest and divergence of opinion"—proved too much for a majority of the operators.

The situation is far from hopeless. It is in fact quite hopeful. Of the constituent parts of that historic group it is clear that eastern Ohio, Illinois and Indiana are strongly in favor of a settlement on the old basis. Pittsburgh and southern Ohio are holding aloof, giving as one reason their fear of the pending indictments of 1921 that hold them in violation of the Sherman law for such interstate contracts as are again proposed and contemplated.

Undoubtedly the interjection of the Coal Commission into the situation has had its effect. The country at large will approve, for the country does not want a strike. The commission has gone beyond fact finding when it suggests and urges as a basis for settlement the preservation of the status quo for another year. The commission has, to all appearances, a firm hand on the wheel, and even if it be not the precise wheel that Congress designated it is one that the public expected the commission to grasp.

Opinions may differ as to the advisability of the specific action taken by Mr. Hammond and his associates, but all will concede that if, as now appears at least likely, there be no strike, then a measure of credit belongs to those who dared step into a situation that has singed those in Washington who heretofore have come to grasp with it.

The Public's Own Doing

WHEN the mines work irregularly it usually is because the public does not buy. This is trying to the operator, but he makes no complaint. He has been in the habit of buying material when he pleased, and in common justice he cannot condemn the coal buyer for doing the same.

But when charged with the irregular time of the mine worker, who, in contradistinction to the mine owner, loudly and vigorously complains, the operator does feel he is justified in resentment, for he realizes that it is an attempt on the part of the public to blame him for its own misdoings. The great mass of the people complacently directs its way without a thought of the common interest and then is angered that certain individuals producing public necessities have not victimized and penalized themselves to take care of those people who have been indifferent both to their own and the community advantage. If the average consumer of coal would give a few minutes to introspection he would realize that he himself and not the operator is to blame for irregularities in production. If he persists in pursuing his irregular way, buying when he will, then he should cease to upbraid the operator for pursuing a like path and working his mines at his own pleasure and convenience.

These are platitudes, of course, but the public sometimes find them inconvenient and consequently not so obvious as they might be if they told a different kind of story.

Europe at Work

EUROPE generally is pictured as being in such a bad way that one is somewhat surprised to note the activity abroad in coal. The rate of production and consumption of coal is an index of industrial activity in Europe as it is here. Since the middle of July the weekly rate of coal production in Great Britain has been consistently above that of 1920 and 1921. For four months the rate has been above 5,000,000 gross tons per week and in December it passed 5,500,000 tons. Demand for British coal is heavy from all the foreign markets—South America, Continental Europe

and the widely scattered coaling stations. Prices are not so sensitive as here and have climbed but slowly, being now but little above the low point of last year. The mine workers, operating under the sliding scale of wages put into effect following the strike of 1921, are receiving the minimum rate. Wages in December were based on October returns. Early next year they will derive the benefit from the better trade of last month.

In France the coal demand is active. Home collieries are working at a better rate than for many months. Reparation coals from Germany, imports from England and Belgium are in demand. Coal for coking—a sign of industrial activity—and gas coals are in particular demand. In Germany the rate of coal production in the Ruhr has been pushed up to pre-war levels through overtime shifts and increased man power. The Silesian fields are working at a high rate of speed, largely to meet the requirements of the German market.

Europe is sick indeed fiscally but quite convalescent industrially. The Secretary of Commerce last week said: "In the large view the world has made distinct economic progress during the past year and the conditions are very favorable to continued progress during 1923. There are in exception three or four states in Europe which give continued anxiety, but these exceptions should not obscure the profound forces of progress elsewhere over the whole world. In the main even in these areas of uncertainty the difficulties are to a large degree fiscal and political rather than commercial and industrial."

Restraining Prices and Equalizing Distribution

REVIEWS of the stirring events which centered in and around the coal industry during 1922 are beginning to appear. When the large consumers of coal get around to chronicling a retrospect of the situation during that year from their viewpoint, there is reason to believe that they will feature the accomplishments of the administration in restraining prices and effecting equitable distribution of such coal as was available. The public utilities and the large consumers are thought to have been particularly pleased by the manner in which these things were accomplished. It was done without resorting to mailed-fist methods. Co-operation to an extent believed impossible in peace times was obtained. It is believed that many consumers will take advantage of the ending of the year to voice a high regard for the achievements of the administration in this particular. It is always true that commendation of this character in no way keeps pace with the flood of destructive criticism.

In this connection it will be pointed out that in spite of a much worse situation in 1922, the disturbance in the coal market and in distribution was nothing like as great as during and following the 1919 strike. In 1920 563,000,000 tons of bituminous coal was produced and distributed. In 1922 the production of bituminous coal was 415,000,000 tons. Moreover, to this great decrease in production of 148,000,000 tons must be added a great shortage in anthracite. In spite of this, 1920 coal prices averaged more than 600 per cent higher than the average for 1913. Even during the peak, in August and September, prices in 1922 were only some 400 per cent greater than the 1913 average.

Economical Humidification

VERY interesting was the suggestion of J. W. Paul at the Coal Mining Institute of America that it might be possible to economize in the humidification of mines by steam by passing the air through old workings, thus effecting the necessary heating of the ventilating current without using for that purpose the heat in the steam, to which would be left only the work of bringing the heated current of air to the saturation point.

Yet it might seem that the project is not without difficulty. Unless the workings through which the current is passed are so wet that the air could not possibly dry them up, the effect of passing low-temperature air unhumidified through such air passages would be to dry them and the dust in them so greatly as to create a hazard.

It is true, humidification at the end of the passages doubtless would put a moist barrier between them and the active workings such as an explosion would fail to cross. In fact with the active workings well moistened, as Mr. Paul suggested, the explosion, unless one of gas, could not be originated. This doubtless he assumed, for otherwise he could not well have advanced his proposition.

Assuming, then, that no fear need be felt that an explosion can spread over the area devoted to the preliminary air treatment, other difficulties yet have to be met. If the point chosen for humidification is far from the main entry it might be difficult to provide coal to a boiler at that spot. The location might be unfavorable also by reason of depth. Taking a steam pipe down a deep borehole would result in much condensation.

However, if with this plan the point of humidification is nevertheless not far from the mine entrance or is at some point remote from it where the cover is light or where artificial cover is provided to resist the entry of outside air, then except for the preheating of the current it would be better to take in air at the point where the humidification is provided. To pass the air through several thousands of feet of roadways would be unnecessary and a prodigal waste of ventilating power. It must not be forgotten that such airways have to be maintained and that this would involve no slight expenditure. It would seem better to take in air, even ice-cold air, and heat it with steam than to drag it through thousands of feet of roadway needlessly.

Mr. Paul said nothing about the possibility in flat seams of flooding the airways in which the current was being warmed and thus partly at least humidifying as well as heating the air in the process. Unfortunately this would make it necessary to have a longer stretch of airway, for air below zero would freeze the water in the roadways and so put a layer of non-conductive ice between the warm coal measures and the entering air. In consequence the current would be heated satisfactorily only in those sections beyond the icy belt.

It might be wished that Mr. Paul had gone more deeply into the relation between the heat gains and friction losses of such entering air. The suggestion opens up opportunities for thought, but without pretending to have made the extensive calculations the problem merits it is safe to say that it is a plan not without many counterbalancing drawbacks to offset its apparent advantages.

Ideas That Prove Profitable To Columbus Mining Co. May Fit Your Conditions

Short Rooms Lower Costs — Nine-Position Cutter Chains Save Power — No. 2 Cable Displaces No. 3 — Knife Switch Stops Button Conveyor When Unsheaved — Car Retarder Lands Cars at Rotary Dump

By A. F. Brosky*
Pittsburgh, Pa.

ALL three of the workable seams, Nos. 4, 6 and 7, of the Hazard (Perry County) field in Kentucky are being mined by the Columbus Mining Co. It is one of the few concerns in that field working all the seams of operable thickness. The company has four mines, Nos. 3, 4, 5 and 6. They all lie close to Hazard, which town is a sort of nucleus for the plants in the Hazard field. The capacity of these mines aggregates 50,000 tons monthly.

No. 5 mine is in No. 6 and No. 7 seams. The other mines are in No. 4 seam, the thickness of which at these plants varies from 38 to 46 in. Under this seam is a shale measure known as the "jack rock" which is from 8 to 14 in. thick. This is underlaid, fortunately, by 2 to 5 in. of coal in which holes readily can be drilled when the bottom is to be lifted to make height for mine cars. If it were not for the thin bed of coal the bottom rock could not be removed with economy. In rooms and entries this jack rock is removed to a width of 6 ft.

The small band of coal, of course, is not loaded out but gobbed with the shale. Above the jack rock the seam is clean and free of partings. The roof of this bed in most places is of sandstone but in some places it is of slate.

Room-Widths and Pillars Made to Suit Roof

In the Hazard field many divergences are found as to width of rooms and pillars and as to the length of the rooms. These differences are found not only for different seams but often for the same seam. Though some of these variations may be explained by personal preferences, in many instances the differences are due to sound considerations as to the best method of working.

In seam No. 4, which is thin, the Columbus Mining Co. drives wide but short rooms and maintains wide pillars, these latter being roughly twice as wide as the rooms. The rooms, which when completed are 175 ft. long, are driven 22 ft. wide on 60-ft. centers, giving a width of pillar of 38 ft. By driving the working places wide plenty of space is left for the stowing of the lifted rock and more coal can be obtained from each room, thus concentrating the area under operation. Of course, no such width could be carried except under sound roof such as is found in these mines. In thicker coal the need for a wide room would not be so apparent, as no rock would have to be stowed and the tonnage in each place would be greater for any given width of working face.

Most mines working the Hazard No. 4 seam adopt a greater room length than is provided at these operations of the Columbus Mining Co. It is, therefore, interesting to note that in Mine No. 5, where two seams are operated, Nos. 6 and 7, the rooms are made even shorter, being only 150 ft. long. This company long ago ceased driving long rooms and for good reasons.

Why Rooms Are Made Unusually Short

By shortening the rooms the length of temporary track to be maintained is diminished without appreciably affecting the permanent trackage. Room track always is roughly laid and that difficulty probably will never be entirely eliminated. The shorter the haul on this temporary track the less will be the chances of derailments. Moreover, the less room track, the smaller the investment in track equipment. The trackage in rooms consumes much steel, and it is well to keep it down to a minimum.

Furthermore, with short rooms the gathering motors can handle larger tonnages per shift and if the cable-reel type of locomotive is used for haulage less cable has to be reeled and unreeled, less weight of cable has to be carried and a smaller reel can be used. The cutting machines also have shorter distances to travel to and from the face and they also require less cable. Not only is time saved in the reeling of cable by having short rooms but a short cable is more easily handled and is less likely to be injured than a long one. The cost of replacement of cable is reduced out of all proportion to the diminished length and the reduced voltage drop with a short cable, though small, perhaps, is worth considering.

The shorter the room the less roof left unsupported. As the area deprived of support is reduced, less timbering per square foot of unsupported area need be provided. Should a squeeze occur, only the smaller area is affected and the ill effects are soon stopped. Thus it

Note—Headpiece shows tipple, conveyor shed and supply track at mine No. 5 of Columbus Mining Co., at Allais, Ky. Note the dip in the conveyor, a condition almost beyond elimination but one which favors the jumping of the button conveyor from the sheaves on which it is stretched.

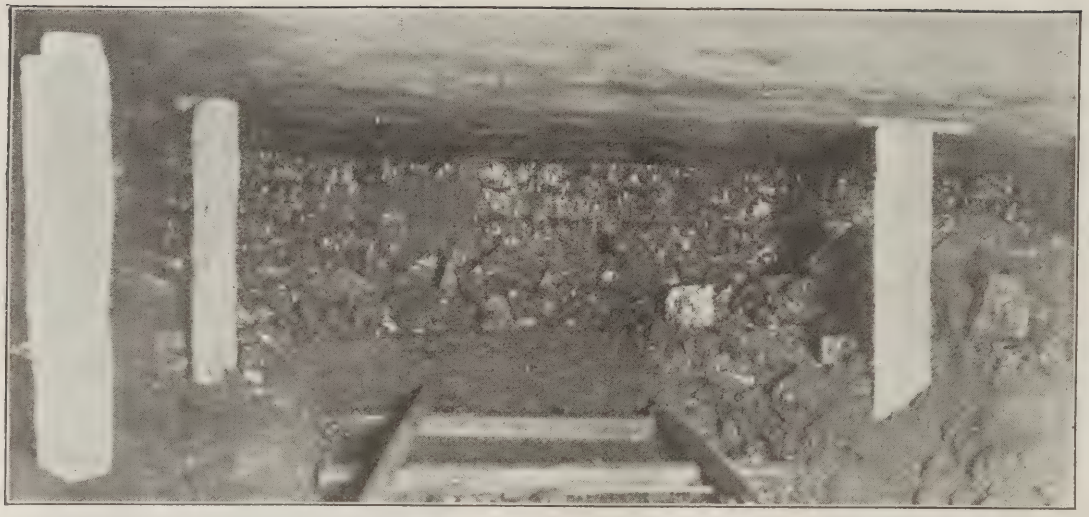

FIG. 1.

Hazard No. 4 Seam

Note the hard "jack rock," which cannot be feazed with an ordinary drill but which, being underlaid by a thin sheet of coal, can be readily drilled under and shot. Much of this material is gobbed in the rooms.

is that, though with short rooms more butt entries must be driven for any given output of coal and more track must be laid down and pulled up, the countervailing advantages may more than compensate for doing away with the long room. This is acknowledged and has been for years. Otherwise rooms would tend with experience and consideration to become longer, which by no means has been true.

In the recovery of coal from any mine there always is an appropriate ratio between the first-mined tonnage and retreat tonnage. What this ratio shall be depends entirely upon local conditions. Certainly it is cheaper to take as little as possible in the first mining, but this often makes expensive and more laborious the recovery of pillars. Driving shorter rooms and more room entries decreases the area taken in first mining, advantages warrant the change.

At this mine entries are driven 15 ft. wide to provide gob space for the bottom taken up in them. The mine is laid out in panels with the main entries on 50-ft. centers and the cross entries and room entries on 40-ft. centers. Cross entries are at intervals of only 800 ft. Barrier pillars, which are 150 ft. wide, are left on either side of the mains, which in every case consist of two haulageways and two air courses.

Upper Seam Slid Down to Lower in Chute

At Allais, Ky., all three seams of coal are worked. The coal from the Hazard No. 4 seam is dumped and prepared on its own tipple. Above, with an interval of 265 ft., lies the Hazard No. 6 seam, and 65 ft. above that the Hazard No. 7 seam. Coal from the upper opening, because of its extreme hardness, is dropped down in a chute, with little breakage, to the level of the Hazard No. 6 seam, where it is discharged from a feeder pan to the rope-and-button conveyor which handles also the coal from the intermediate seam.

The middle seam, Hazard No. 6, which runs from 7 to 8 ft. thick, also is worked on the room-and-pillar system. The mains on the two-entry system are driven from these and a 150-ft. barrier pillar is left on either side. The entries are made 11 ft. wide on 40-ft. centers. The entries are provided with a thinner chain pillar than in Hazard No. 4, as the cover is not as heavy. The rooms are mined 20 ft. wide on 50-ft. centers. Because of the small interval between Hazard Nos. 6 and 7 and because of the weakness of the sandstone, as is evidenced by the drumming sound it sometimes emits when struck, care is taken in working No. 6 not to drive places or pull pillars in advance of workings in the upper seam.

Until a year ago the same room-and-pillar system was used in both seams, but now the new workings in the upper seam are laid out on modifications of the "Elkhorn" system. Little space will be used here to go into details of this scheme of mining, for at a later date other mines will be described in which the true "Elkhorn" plan and its modifications will be explained.

Big and Small Room Pillars Alternate

It may be said briefly, however, that in the upper seam of No. 5 mine the entries are driven 10 ft. wide on 40-ft. centers and a barrier pillar is left on either side 100 ft. wide. The smaller pillars well suffice to sustain the lesser loads resultant on lighter cover. The rooms are driven systematically as follows: Two 16-ft. rooms on 29-ft. centers are succeeded by two 16-ft. rooms on 80-ft. centers. Their length usually is 150 ft., but in the irregular coal areas characteristic of seams outcropping high above stream level these may be increased near the crop so as to complete the work of mining some outstanding coal area. Rooms are driven off both room entries. In the pillar drawing, which is on the advance, a wide and an adjoining narrow pillar are brought back as one unit.

In a later story the merits of the system with alternate wide and narrow pillars will be detailed. Experience has revealed to this company that the system provides an almost absolute control of roof action and a greater flexibility of mining—that is to say, in robbing the wide pillar, crosscuts may be driven through it and the portions of the pillar thus cut off mined as desired.

In No. 5 mine three men load from one pillar set which, as stated, consists of a wide and a narrow rib. Eight cars may be spotted for loading at one time in the cuts of the wide pillar but only one can be placed for the loading of the narrow pillar. Two men load their first car from the former while the third man loads his from the latter. Then this third man loads his second and third cars from the wide pillar, working with the first two men. It is evident that as a result the coal operations are concentrated so that fewer gathering motors are needed for any given tonnage.

In all three seams of these mines shortwall mining machines are used. Each 6½ ft. cutter bar has a nine-position cutter chain, power being conveyed to the machines through a No. 2 all-rubber cable. These features are maintained as standard by the company.

Much may be said in favor of the nine-position cutter

chain, and the argument is sustained not only by reasoning but by a period of experimentation. The greater the number of bit positions the more complete the cutting action of the cutter chain. The paths of adjoining bits with a nine-position cutter chain leave little or no clearance between them, so that no ridges are left between the channels to increase the rubbing surface and add to the friction. Breaking off these ridges and working along their flanks is the cause of much unnecessary friction and loss of power.

Though no power readings have been taken to ascertain the current saved, the physical manifestations in cutting clearly point to that saving, for the machine cuts more easily, as is proved amply by the decreased tension in the feed ropes.

All cables used on shortwall machines in these mines are of the concentric, all-rubber type. The size in general use for this particular class of cutting machine is a No. 3, but the Columbus Mining Co. contends that this size is too small and that a No. 2 cable should be preferred. The Elkhorn division of the Consolidation Coal Co. is in full sympathy with this point of view. It recommends using a size larger than will carry ordinary machine loads.

The Columbus Mining Co. has tried the No. 3 cable in its mines long enough to conclude that a No. 2 cable is more desirable. The smaller size deteriorates rapidly on this machine, so that after short service it is prone to break down. The copper area in the smaller cable is too small to carry the excessive power needed when a piece of hard cutting is encountered. It may serve the purpose for a while but not for any long period of time. The excess heat generated under the rubber cover is not dissipated, and the cable is likely to burst asunder. The voltage drop from the feeder to the machine when No. 2 cable is used is less than that with the smaller cable.

Use Many-Position Cutters and Big Cable

The two changes described, the nine-position cutter chain and the large cable, cause the machine to work with greater facility, and more places are cut in a shift. The more generous cutting surface of the chain removes much of the wrack and strain on the pinions, bevels and other gears. The result of these two precautions is to diminish the heating of the motors and increase the cutting efficiency correspondingly. With the usual shortwall equipment, in the No. 7 seam of the No. 5 mine of the Columbus Mining Co., the best record was ten to twelve places per shift. Under the same conditions and in the same mine, with the alterations noted, the machine will cut fifteen to eighteen places per shift; hence the capacity of the machine is increased 33⅓ per cent.

The adjoining mine is equipped with four shortwall machines, two each of two different makes. Make No. 1 was equipped with a five-position cutter chain and make No. 2 with one of seven positions. The men preferred the latter machine because with it more places could be cut in a shift. Then the company removed the five-position chain from make No. 1 and put on one having nine positions. Thereafter the cutters showed preference for make No. 1, which proves conclusively that the change is beneficial.

The mine is equipped on the surface with a rope-and-button conveyor. This is provided with an electric knife switch which is in the circuit of the no-voltage release on the oil switch and which will break the circuit should the rope jump the sheaves. The device was originated by A. F. Barbieux, general superintendent of these mines.

Under certain conditions the rope conveyor is likely to jump from the idling or take-up sheave at the bottom of the hill. It happens that the conveyor line curves downward between the headhouse and the tipple, and the rope, accordingly, is left slack so as to fit the curve. This frequently has to be arranged in designing a conveyor line, as the level at which the conveyor is brought into the tipple is rarely at the same height as the regular hill slope at that point and therefore the slope of the conveyor must be eased up at its end. During a chilly night the conveyor buttons may be frosted to the trough and, until the finger of the motor control has turned to the fourth or fifth point, may refuse to start up for the day's run. The rope then starts with a jerk, takes up the slack suddenly and may whip the rope off the idling sheave.

Even when the conveyor is started in warm weather the rope may jump from the sheaves if there is a load in the conveyor trough, for the conveyor may refuse to budge until more than three units of resistance have been cut out. Throwing the motor handle still further, a heavier current passes through the motor and the rope then starts with a jerk. This lifts it above the level of the conveyor trough, only to fall again, coming in contact this time not with the metal sheeting of the trough but with the coal. This causes the takeup truck on which the lower idling sheave is mounted to move toward the hill, giving the rope play enough to clear the sheave. Though the rope has left the lower sheave, the motor continues to function and much damage may be done.

Only two of the reasons why the rope leaves the

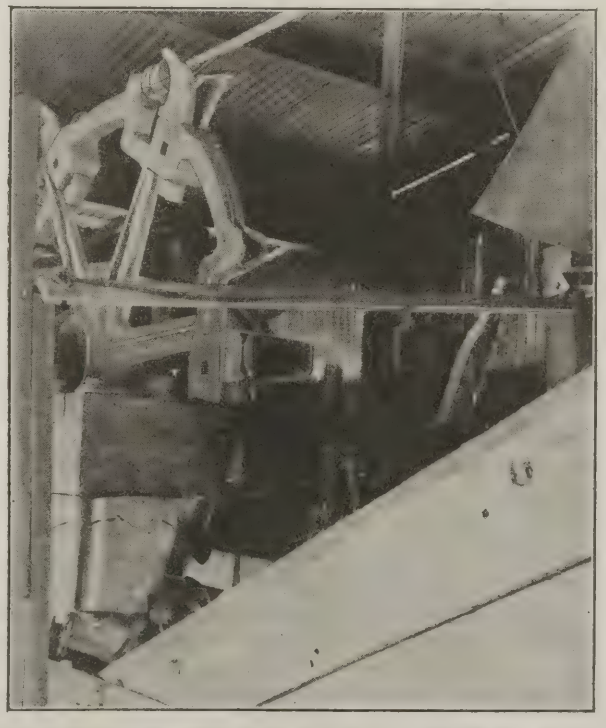

FIG. 2—KNIFE SWITCH AND IDLER SHEAVE

A two-wire conductor is taken down the conveyor gallery to the point shown. Here a knife switch is inserted. This switch is simply a board across which is carried one end of the circuit, the terminal of which rests against a knife plate, to which the other end of the circuit is attached. If the rope leaves the sheave the switch is knocked out, thus breaking the no-voltage release circuit. This trips the oil switch, stopping the motor. Note the wire-broom arrangement for cleaning the rope and buttons as they pass.

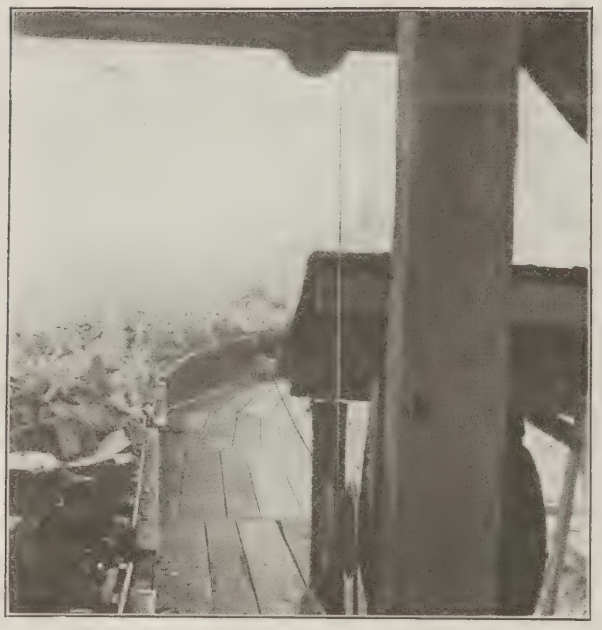

FIG. 3—RAILROAD-CAR RETARDER FEEDS MINE CARS

The gradient on the loaded track is such as to permit cars to gravitate freely to the dump. These cars are then controlled in their passage to the rotary dump by a railroad-car retarder which itself is regulated by the dump operative from his control platform. The cars, as is usual in Kentucky, are equipped with roller bearings. They have a capacity of 2½ tons. The angle-iron edges at the tops of the cars hold the wagons in place when revolved in the dump.

sheaves have been mentioned. There are others, however, and they do not occur always on starting, so to prevent damage a man would have to be stationed to watch the rope, for it comes loose at the sheave farthest removed from the motor control. To station a man for this purpose would be expensive, and no assurance could be placed on his keeping steadily on the job. Much damage might be done in the brief period before the motor is stopped.

The no-voltage release on the oil switch controlling the 25-hp. slip-ring motor by which the rope conveyor is driven is carried from the headhouse through the conveyor gallery to a point near the bottom idling sheave, which is supported on a takeup truck. At this point a large knife switch is inserted in the circuit. This knife switch is mounted between two upright supports, one on either side of the rope and at a height to allow the knife switch to lie horizontally a little higher than midway between the upper and lower course of the endless rope. If for any reason the rope jumps the sheave on the lower end, it drops down and breaks the circuit leading to the no-voltage release and the oil switch is tripped. The motor stops instantly and cannot be started again unless the rope is put in place and the knife switch reset.

Another use for the friction-drum railroad-car retarder has been discovered at the No. 4 mine of the Columbus Mining Co. The load side or the approach to the dump is on a grade sufficient to cause the loaded mine cars to gravitate to the tipple from the knuckle where the locomotive uncouples. The grade is steep enough to allow the cars to run freely, but they are held back by a friction-drum car retarder operated by the man who controls the rotary dump. The same man takes checks also.

The retarding rope passes over a ground sheave between the tipple and the knuckle point and the end is attached to as many cars as occupy the intervening distance to the rotary dump. When these cars are discharged the end of the rope has progressed to the dump. It is then uncoupled and carried back to the sheave and coupled up to another string of mine cars. One man can feed the cars, take the checks and dump as much as 1,000 tons of coal in eight hours. The crowning merit of this scheme of car feeding is that each car may be spotted accurately on the rotary dump by the dump operative, so that the procedure, while mechanical, has human intelligence controlling it.

What to Watch in Running a High-Lift Centrifugal Mine Pump

FROM A BRITISH CORRESPONDENT

AS A result of its compact design and adaptability to electric drive, the centrifugal pump has largely displaced older and more cumbersome designs. The types formerly used always were likely to give trouble underground, for the floor movements threw the different parts of the equipment out of alignment, thus causing hot bearings or fractured castings. Although the general theory of centrifugal pumps is well known, their practical operation has not received the attention its importance warrants. Especially is this true where the pump has to be operated under a high head, as in deep mines. The following notes apply more particularly to large units of this description, but much of that which makes for satisfactory operation in a large high-lift machine also applies to smaller installations.

It is well known to those acquainted with the practical operation of the centrifugal pump that unless both the casing and suction column of such a machine is fully primed—that is, completely full—it will not "catch" the water and begin pumping. Trouble from this source usually can be traced to a defective foot valve. Of all the valves connected with a pump, this one probably is the most important. Being of a non-return design, it allows the passage of water in one direction only, namely, toward the pump.

CONDITION OF FOOT VALVE MOST IMPORTANT

The condition of the foot valve is highly important, especially when priming the pump preparatory to starting. If the valve seat is defective, the water for priming leaks past it and into the sump. In most cases the quantity of water that the bypass makes available is limited and if the foot valve leaks badly the water runs away more rapidly than it can be supplied, so that it is impossible to fill either suction column or pump. Under exceptional circumstances the main valve on the delivery column may be slightly opened, but this should be done only in an emergency when it is imperative to start a pump to prevent the sump from overflowing.

It is difficult to begin pumping under such conditions and often the pump may have to be started several times before it will catch water. This continual restarting throws much unnecessary wear and tear on the controlling apparatus. A fruitful cause of a pump's failing to catch water is too rapid priming. A high-lift machine necessarily is built with several stages, and the cavities in which air may become trapped are numerous.

If by opening wide the bypass valve a large quantity of water is forced into the pump under the pressure of the discharge column, the air has little opportunity to escape, even assuming that the air cock upon each stage has been opened. The pump should be primed slowly. If the foot valve is in good order, little of the water remaining in the pump and suction column

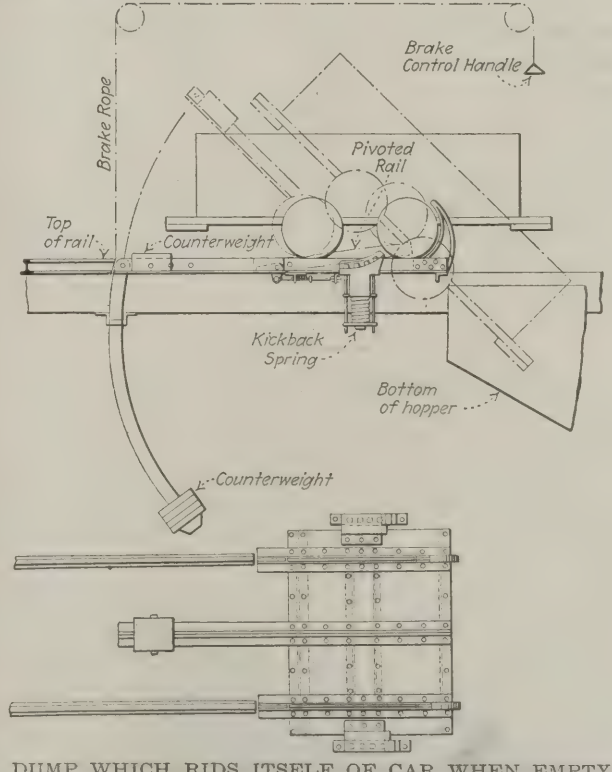
when the machine was stopped will have leaked back into the sump. Under such circumstances the pump should need for starting only a small quantity of water. A foot valve, though normally subjected to only slight water pressure, should be designed to withstand the full head of the delivery column. Of course a check valve should be installed at the bottom of every column and immediately above the pump, so that as the machine slows down and the flow of water ceases this valve will close automatically and prevent the water in the column from running back through the pump and into the sump. Where a high head must be dealt with it sometimes is advisable to put two of these valves on the delivery column, thus providing against the failure of either.

If by accident or necessity the water column becomes empty, great care is necessary when starting. When a pump is working under its normal head, the quantity of water handled is restricted. If, on the other hand, the column is empty or only partly full, it offers little or no resistance and the pump will pass an abnormal quantity of water if the delivery valve is wide open. Consequently, when starting under such conditions, the delivery valve, after the pump has been brought up to speed, should be opened slowly, careful attention being given meanwhile to the ammeter reading, which should not be allowed to go above normal full load. As soon as the column is full, which will be indicated by the ammeter not exceeding the full load reading, the valve may with safety be opened to its fullest extent.

Dangers From Pump Running Short of Water

It is dangerous to allow a centrifugal pump to run more than a few minutes when full of water unless this is actually passing through the machine. The temperature under such circumstances rises rapidly, evaporation begins in a few minutes and the pump may be ruined soon unless brought to a standstill. While running this condition may be brought about by either of two contingencies; the water level in the sump may fall below the foot valve, thus depriving the pump of water, or an accumulation of refuse in the sump may, through the absence of a suitable screen, block the valve and thus prevent the water from reaching the pump. To forestall these possibilities safeguards should be provided on every pumping unit. A suitable float should be placed in the sump indicating within the pump room at all times the level of the water; at low water this should automatically shut down the pump motor. As an additional safeguard a watertight fire alarm should be fitted to the pump itself, so arranged as to cut off the motor current in the event of an undue rise in temperature.

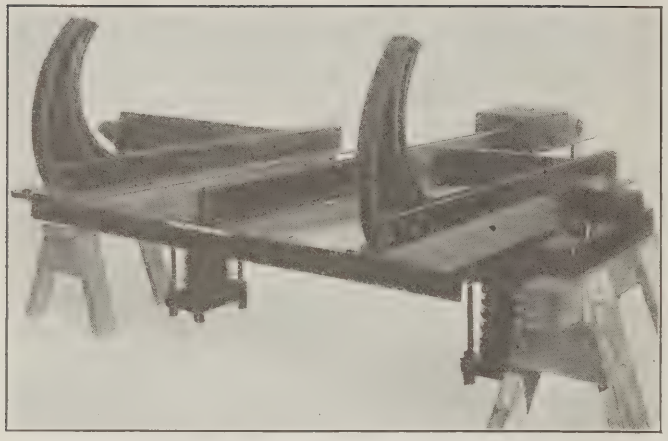
The bearings of a centrifugal pump require constant supervision, because any journal running at, say, 1,500 r.p.m. develops trouble with extreme rapidity when once things begin to go wrong. Pump bearings, of course, become warm soon after starting, even though they are water-cooled. They should not be permitted to reach a high temperature, and anything over about 100 to 120 deg. F. should be treated seriously. A bearing developing this temperature should be opened and examined at the first opportunity.



To obtain satisfactory life from bearings and freedom from overheating they must be supplied with suitable oil. Once having made a selection the same quality and grade should be habitually used except under unusual circumstances. Heavy oil should not be employed because of the difficulty in maintaining its free circulation through the bearings and journals, a failure in which results in overheating and excessive wear. On the other hand, use of an extremely light oil should be avoided, as it provides insufficient body between the bearing surfaces. Furthermore, when raised in temperature because of its low viscosity, abnormal quantities are carried into the bearings by the oil rings. This may result in splashing and leakage.

It is perhaps unwise to rely altogether on the pump attendant to keep a constant watch on the bearings. For this reason it is advisable to install a suitable fire alarm on each, working in conjunction with the one on the pump itself. All three may be arranged to interrupt the motor circuit in case of any excessive rise in temperature.

Dump That Ejects Empty from Platform



DUMPING, or the discharge of a car's contents, while admittedly a minor operation in coal producing, nevertheless is one of such importance that it often requires close attention. Many schemes and devices have been invented to accomplish the desired result. One of the latest of these is shown in the accompanying illustration.

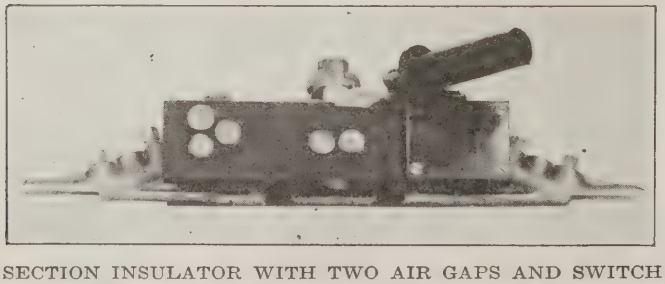
This dump, which is of the kickback type, is designed to afford some of the advantages and speed of the crossover dump. As may be seen in the accompanying illustration, the device embodies a combination of tilting platform and tilting rail sections. The tilting rails are attached to steel springs, the tension of which is adjustable and may be made such that a loaded car will depress them whereas they will rise under the weight of the same car when empty.

DUMP WHICH RIDS ITSELF OF CAR WHEN EMPTY

"Kickback dumps" when they return the car to the horizontal give it little if any movement backwards. For this reason they are ill termed "kickbacks." They are so-called only because if they kick anyway they should kick back but they don't really kick at all, and the men who handle the car are relied on to move it to the nearby empty track. This dump has pivoted rails that the car before dumping depresses. After the car is dumped and righted the rails rise so that the coal rolls off the dump without the interposition of a hand.

DUMP SHOWING SPRINGS WHICH MOVE PIVOT RAILS

When the car comes on the dump the wheels force down the pivot rails which sink to the level of the rails on the dump platform. After the car is dumped it is too light to hold down the pivot rails and they spring up putting the car on a grade steep enough to hurry it off to the empty track where the grade, there provided, will take care of its further movement.



In operation when a car comes into this dump it depresses the tilting rails against the tension of the springs till the rails reach the level of the angle irons between which the tilting rails move. Here these rails are locked in their depressed position while the bed or platform, tilts upward to the dumping position of the car. The dump may be held in the up-tilted position as long as desired by means of a brake lever bearing against the sword bar which projects downward from the end of the dump arm.

When the sword is released, however, the dump returns to a horizontal position, upon attaining which the tilting rails are unlocked. The tension of the springs under the ends of these rails is sufficient to force them upward now that all that resists their upward movement is the weight of an empty car. Accordingly the car is given a decided impetus backward off the dump and through the kickback switch. From this point onward arrangements may be made for the free movement of the car under the action of gravity.

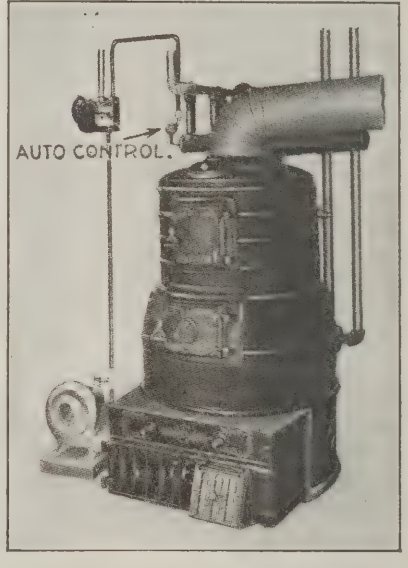
Because of its construction and method of operation it is claimed by the makers, the Charleroi Iron Works, of Charleroi, Pa., that this dump is not only strong, simple and positive in operation but that it permits greater speed in dumping and is not as destructive to cars as dumps of the ordinary type.

Double-Gap Section Insulator with Parts Renewable Without Removal from Line

AS THE electrification of coal mines has resulted in the construction of an extensive overhead network of charged wires and as the mining industry, like many others, employs in the main relatively unskilled laborers for the handling of these uncovered conductors, it is necessary to have a means of protecting these men while they are performing their duties. This protection usually is afforded by section insulators, the use of which in most states is required by law.

SECTION INSULATOR WITH TWO AIR GAPS AND SWITCH

The two beams, one on each side of the arcing tips leave a clear space above. Thus there is no charring, the arc tending to be blown out instantly when the switch is opened under load.



The Westinghouse Electric & Manufacturing Co. has developed a double-gap section insulator which meets all service conditions and also fulfills the requirements of the mining laws.

It is a double-beam insulator having two air gaps as insulating mediums and a hand-operated switch mounted on the top of the wooden beams. It is intended for use in mines where the operating voltage is 600 or less. The arcing tips, castings and approaches are made of bronze and can all be renewed without removing the insulator from the line. The switch contacts, on top of the end casting, also are renewable.

The two beams, one on each side of the arcing tips, leave a clear space above, and no trouble is caused from the arc charring the beam. This arrangement also has the advantage of giving a blowout effect on the arc when opening the switch under load. Another advantage which is especially appreciated in low mines is the small overhead room required.

Grate for Domestic Use of Bird's-Eye Coal

SUFFICIENT effort seems hardly to have been made by producers to induce the domestic consumer to use fine sizes of anthracite. There are two parties interested in the sale of fine sizes, the producer and the consumer; the retailer is not affected much either way. The producer finds sale for an otherwise waste product and the consumer gets a coal that is delivered to him at a rate below the cost of product plus freight and handling. It will be interesting, therefore, to note that the New England Fuel & Supply Co., of 73 Water St., Boston, Mass., is prepared to supply a grate for burning Schuylkill bird's-eye (No. 2 and No. 3 buckwheat) with the necessary electric fan blower, electric control and cleaning tools. The grate is perforated with slots measuring $\frac{3}{16}$ x $\frac{1}{16}$ in. and is laid on the top of the grates already installed. The fan is of a special composition aluminum and has six to ten blades operating in a cast-iron case. The electric control cuts off the electric current when the temperature of the hot water on the heater or furnace pipes reaches the desired point and starts the fan going as soon as the temperature falls to another suitable level. When running the fan keeps the ashpit under a steady pressure.

BIRD'S-EYE MAY YET BE A DOMESTIC FUEL

By the use of a special grate, an electric fan blower with electric control bird's-eye coal can be used in connection with the ordinary household furnace.

Some Recent Developments in Scraper Loading Methods*

Scraper Used for Storage and Reclaiming of Coal on Surface—Self-Transporting Chute for Loading Cars Underground, with Equipment for Operating Scraper and Illuminating Face—Keeps Ropes off Heading

By J. S. Housman
Chicago, Ill.

THOUGH mechanical loading has made much progress, the art still demands a close co-operation between operator and manufacturer. Much exceptional work has been and is being done both in mine and factory. In this article will be detailed the experience of the Goodman Manufacturing Co., of Chicago, Ill., in loading coal by mechanical means under widely varying mining conditions.

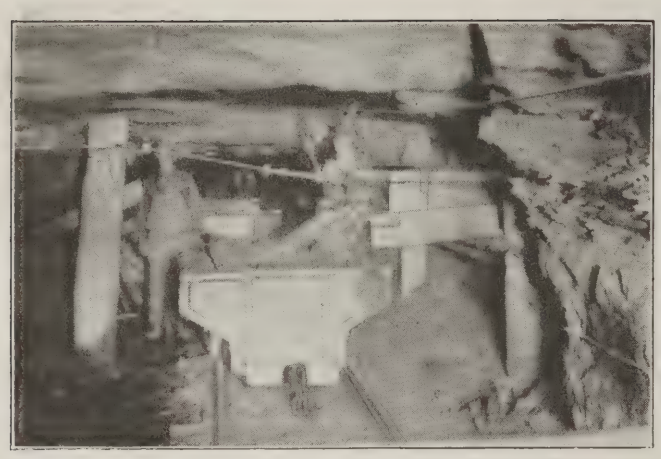
Mechanical loading may be said to divide itself into two principal classes: (1) That in which the material to be loaded is put into cars immediately at the point where it is loosened from its original location, and (2) where the material is transported a distance from its original place and put into cars by a scraper, conveyor or some other means. The first class may be termed that of face loading, the second that of entry loading.

It is with the scraper method of entry loading that this paper has to deal. This method was selected as the most desirable point of attack in the solution of the general loading problem because it seemed to require the simplest and least expensive form of apparatus and to be capable of great flexibility in operation.

The most usual form of scraper loader is so well known in the industry that it is unnecessary to give here more than the briefest description. It consists in principle of a bottomless scoop, or scraper, moved by a head rope and a tail rope and guided by sheaves and deflectors suitably located and actuated by a two-drum winding engine. A chute, or runway, is built at the outlet of each working place served, so that the scraper may deliver its load over the edge of the car.

As the winding engine usually is located in the entry and the scraper operates at the face, a signal system must be installed between them. The illustrations herewith make apparent the manner in which the scraper operates.

It has been ascertained by experience that a scraper loader of this type is best adapted to the following mining systems: (1) Longwall, either advancing or retreating; (2) panel work; (3) room and pillar, where wide faces, say 60 ft. wide or wider, are available; (4) pillar drawing, where the same general plan is used as in longwall work.



Cost of Hand and Scraper Loading Compared

Data have been procured showing the cost of mining and loading coal by hand and with the aid of the loader at various mines, each using some one of the foregoing systems. The method adopted for comparing hand with scraper loading is based upon the assumption that both start at the same point—that is, at the face which has been undercut and is ready to shoot. The governing factors for hand loading are as follows: (a) Loading rate per ton of coal, usually including drilling, shooting and powder; (b) yardage per ton of coal loaded.

The items for loading with the mechanical scraper loader are: Comparative mechanical scraper loader cost, including the following items: (a) Total labor; (b) powder; (c) power; (d) rope renewals; (e) miscellaneous repairs and supplies; (f) depreciation; (g) interest. The cost of building chutes and preparing places might be added but is paired against the saving in gathering and in track.

As typical installations of the equipment may be cited: First, a mine in West Virginia which has two

*Article presented at annual meeting of Alabama Mining Institute, Birmingham, Ala.

SCRAPER LOADER DISCHARGING COAL INTO MINE CAR

A chute is built on the entry to permit the scraper to get over the top of the car. This shows the condition where entry height has been made by taking down top. The chute is not moved till the place is worked out. With this arrangement cars can be loaded in full trips. As soon as one car is loaded another takes its place, something entirely unknown where the loading is done at the face.

scraper loaders in operation. The thickness of the coal seam in this mine varies from 24 to 28 in. The coal is covered with 4 in. of drawslate that comes down when the face is shot and is gobbed by the loader crew. The work is done on a 175-ft. face and the men load approximately 60 tons per day at a saving of 53c. per ton. The hand-loading costs are:

(a) Loading rate, per ton	$0.75
(b) Yardage, per ton	.45
Total, per ton	$1.20

The mechanical loading cost per ton is 67c.

Second, a room-and-pillar mine in Kentucky which has three of these loaders in operation, working a coal seam 40 in. thick which is overlaid with from 2 to 10 in. of drawslate that comes down with the coal. The room faces are about 50 ft. wide. During the month of July the scraper-loader coal was cut and loaded, the slate gobbed and the places timbered for 90c. per ton.

Third, a mine in West Virginia with coal 30 in. thick, working a 150-ft. longwall face. There are five men on the loader at a contract price of 40c. per ton, a saving over hand loading of 42c. per ton. The hand loading costs are:

(a) Loading, per ton	$0.70
(b) Yardage, per ton	.12
Total, per ton	$0.82

The illustrations indicate the possibilities of the loader in underground work. It also is being used successfully in surface work such as stockpiling and the loading of coal into railroad cars and trucks.

Some time ago a general manager of a coal company in West Virginia determined to put his coal into a stockpile when short of railroad cars. This plan not only would enable him to keep his mine in daily operation with a certain degree of independence of car supply but also would provide a reserve stock of coal that could be drawn upon at any time to take advantage of a rising market.

The natural conditions lent themselves readily to the general scheme. The drift opening of his mine was high up the side of a mountain, giving plenty of height for dumping and storage. The slope of the mountain caused the coal to flow readily down to the pathway of the scraper loader.

The loader he is using consists simply of a tandem two-drum winding engine and a scraper of one-ton capacity. The engine or hoist is placed at one side and near the foot of an inclined runway which he caused to be constructed between the tipple and the foot of the slope of the stockpile. Here the operator of the hoist has full view in both directions and can thus respond to any signals made to him from the tipple or the scraper loaders.

The scraper runway is built temporarily of planks, but is to be replaced by concrete. The incline to the tipple is 100 ft. long and has a pitch of 27 per cent. The scraper discharges into a bin in the tipple, where the coal may be loaded direct as mine-run or passed to the screens for sizing.

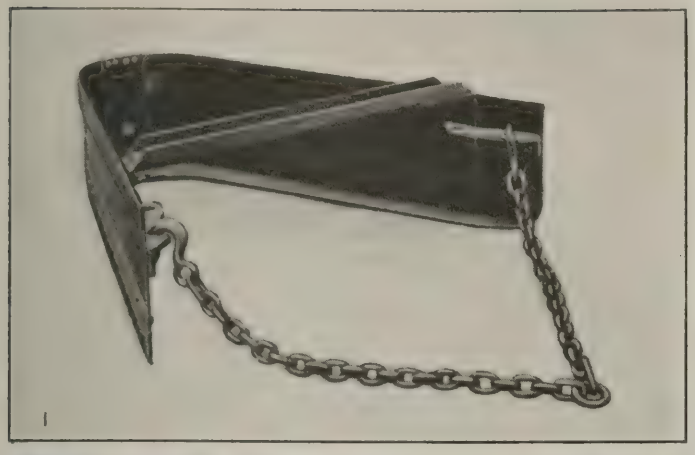
Two men operate the apparatus, one being at the winding engine and the other at the stockpile, where he can guide the scraper while loading. A letter from one of the men connected with the installation gives the following data:

"I have not as yet been able to run a full day on account of shortage of railroad cars, but the following will show some of the results obtained:

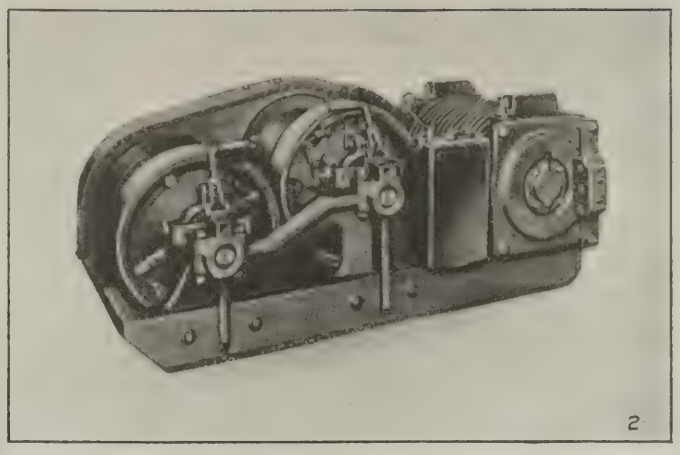
Date	Railroad Cars	Time
Aug. 1	3 (two of 55 tons one of 70 tons)	
Aug. 5	4 (all 55 tons)	
Aug. 10	3	5½ hr.
Aug. 14	3	4 hr.
Aug. 21	2	2½ hr.

I have loaded three 55-ton cars and one 70-ton car in 5½ hours and can load 300 tons in eight hours with two men to help me."

A later letter gives the following operating results:



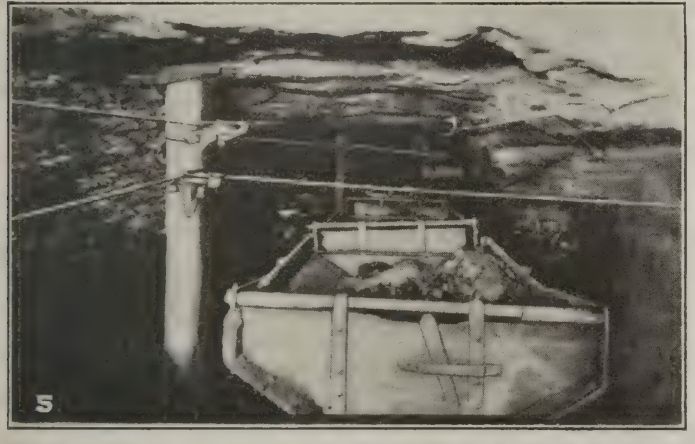
Date	Tonnage	Time
Sept. 4	150	3 hr. 26 min.
Sept. 6	165	3 hr.
Sept. 13	100	2 hr. 18 min.
Sept. 16	120	2 hr. 12 min.
Sept. 17	305	6 hr. 17 min.
Sept. 25	220	4 hr. 30 min.
Sept. 29	225	4 hr. 10 min.



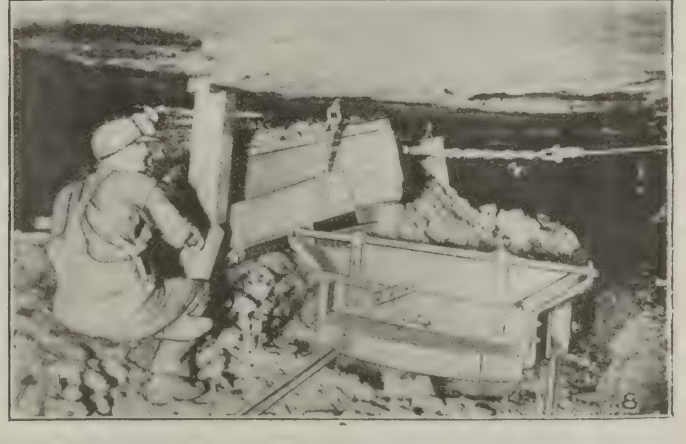
Storage as Essential as a Flywheel

The advantages to be gained by an installation of this kind are: (1) Steady operation of the mine, affording all the economies of regular working, reduced overhead expense per ton produced, greater efficiency from men and machinery and improved mine conditions. (2) Better organization of men due to steady work. (3) Reserve stock for shipping on a rising market. (4) Maintenance of uniform daily shipments regardless of late delivery of cars. (5) Maintenance of uniform daily mine output, despite any delay in production due to trouble underground. (6) Increased allotment of railroad cars resultant on increased ability to load them quickly.

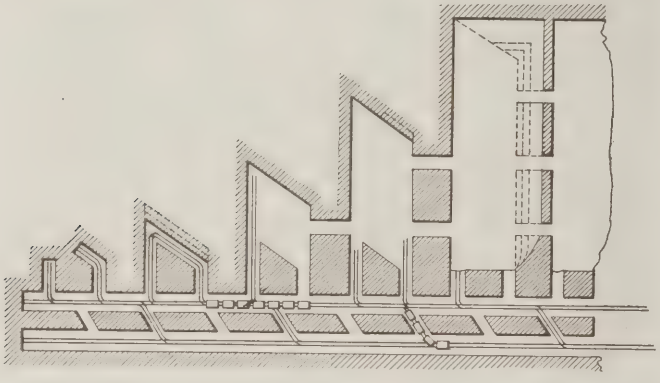
This method of operation is not confined to mountainous country alone, for at an operation in Kentucky the coal is dumped on the level, the loader apparatus doing both the stockpiling and car loading. This machine has handled 320 tons in 8 hours—that is, it has placed on a stockpile 195 tons and loaded 125 tons in trucks and wagon.



To obtain even greater flexibility and reduce the "dead work," or time required to maneuver the equipment about the mine, another type of scraper loader having the same functions as that described but which has further advantages has been devised. The same



SCRAPER LOADER WITH STATIONARY HOIST SET IN HEA DING



(1) Bottomless scraper 18 in. high with a capacity of 1,000 lb. The scraper is pulled into the coal by the chain shown and returned empty by a rope attached to the rear of the scraper. (2) This scraper hoist has a height of 27 in. and is equipped with a 35-hp. motor. (3) Winding engine on entry ready for scraping. It is held from moving forward by the two props in front and from tipping up by a piece of timber driven between the motor and the roof. Any comparatively level spot will serve. (4) Winding engine with center sheaves. (5) Ropes and post sheaves. The ropes lead from the center sheave to those in the foreground. The tail rope is the lower one. The pull rope can be seen crossing the entry further up. (6) Filling up a scraper with coal. The seam is 28 in. thick. (7) Scraper seen from behind. (8) Scraper discharging coal into car in a longwall mine. Here bottom is lifted in the roadway, and a mere apron serves to elevate the coal instead of a more lengthy dragging plane.

bottomless scraper, closed sheaves, jacks, deflectors and signal systems are used on both types of loaders.

This type of loader is somewhat more complicated than the first, and the impression might prevail that sight has been lost of the fact that simplicity is the prime requisite in scraper-loader apparatus. It is quite true that any combination of two or more mechanical devices interdependent in operation usually produces complication, yet in this case it was felt that the advantages to be derived would more than compensate for the problematical disadvantage referred to, and so it has proved in actual operation.

As to the costs of running this type of scraper loader may be cited the results in a mine in Kentucky which is working a coal seam 72 in. thick. The roof is of limestone above 7 in. of drawslate which comes down when the coal is shot and is handled by the loader crew.

There is also a 2-in. blue band in this coal bed about 24 in. from the bottom of the seam. This bottom is

ROOM-AND-PILLAR SYSTEM WITH DIAGONAL FACES

This plan shows how the diagonal faces finally can be squared up and the pillars worked away till only a narrow pillar remains between rooms.

of a very soft fireclay. The following data have been obtained from actual experience acquired in the operation of one of these machines over a period of a number of days:

Capacity of cars, tons	2
Total daily output of mine, tons	1,198
Daily output of loader, tons	72
Average time worked daily by loader, hr.	4.7
Average output per hour by loader, tons	15½
Average number hand loaders in mine	129
Average output per day per man hand loading, tons	8¾
Average output per day per man with loader, tons	18
Theoretical average output per man loader working full shift, tons	31
Hand loading rate per ton	$0.76
Cost per ton with loader	0.46
Actual saving per ton	0.30
Theoretical saving per ton on loader working full shift	0.50

A full shift log kept by the general superintendent of the mine shows that the total time from start to end of shift was 7 hr., 26 min. This time was divided as follows:

Loading cars	4 hr. 36 min.
Cleaning track	25 min.
Loader delay	38 min.
Pulling down coal	46 min.
Moving loader device	55 min.
Miscellaneous delays	10 min.
	7 hr. 26 min.

Total output from three 30-ft. places was 114 tons. The average lading per car was 1.7 tons.

2 cars averaged		1 min. per car
7 cars averaged		2 min. per car
19 cars averaged		3 min. per car
23 cars averaged		4 min. per car
5 cars averaged		5 min. per car
2 cars averaged		6 min. per car
3 cars averaged		7 min. per car
2 cars averaged		9 min. per car
2 cars averaged	(cleaning up places)	10 min. per car
1 car averaged	(cleaning up places)	15 min. per car
Total 66 cars		4 hr. 36 min.

Average time per car 4.2 min.

Total delay 172 min. of which there was chargeable to loader 38 min.

This particular run showed a saving of approximately 50c. per ton.

Another room-and-pillar mine in Kentucky is working a coal seam 40 in. high which has drawslate approximately 7 in. thick, that comes down when the coal is shot. The faces of the rooms are 40 ft. wide. A crew of four men gobs the drawslate and loads the coal for a contract price of 50c. per ton. The hand loading price is 81c. per ton.

This company also has a large acreage of slightly pitching coal which cannot be recovered profitably by hand, due to excessive yardage costs and the refusal of the miners to push the cars up the pitch without compensation. Both factors are problems eliminated by the use of the scraper loader.

Advantages of Locomotive Chute-Hoist

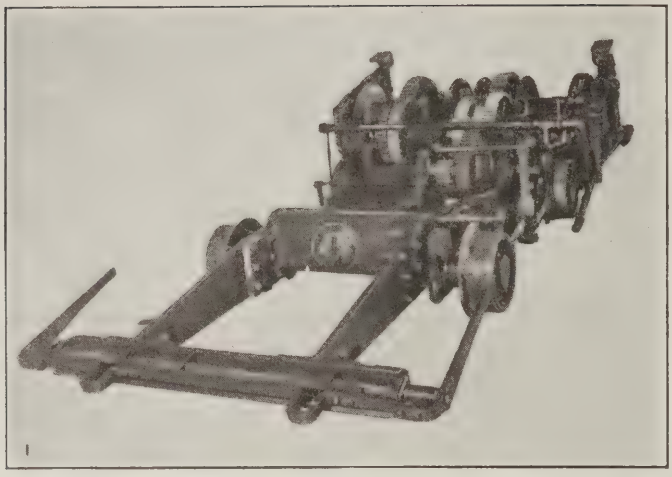
It is claimed from experience that scraper loaders can be operated successfully either by day work or on contract. The following are outstanding features of the scraper loader just described: (a) The hoist is self-propelling. (b) The chute is mounted over a hoist, thereby saving the cost of wooden chutes. (c) The system is flexible, because the hoist, being self-propelling and self-contained, is not tied up to a restricted area. (d) The operator is in position to see the scraper both when being loaded and when dumping into the cars, as the hoist is set in the room neck. (e) The equipment can be operated with one man less than is required with the first arrangement. (f) The rope at the face is sheaved automatically by the operator of the hoist, thereby eliminating the labor of sheaving the rope. (g) One less jack and sheave are used at the face and the center sheaves and all post sheaves on the entry also are eliminated. (h) No chute aprons are necessary; a complete chute and apron are part of the hoist. (i) It is not necessary to stop on the straight rib when coming out with the loaded scraper, production thereby being speeded up; this, of course, is due to the automatic rope-sheaving device. (j) Little work is necessary in making a new installation, as there is no need to build chutes nor set props for sheaves on the entry. (k) Speed is made in moving from place to place; thus at a mine in Pennsylvania a place was finished, the loader was moved and the scraper loader was operating in the next place within 15 minutes. (l) When ready to move to a new working place, the scraper and other accessories are pulled into the chute by the hoist, thereby reducing the manual labor of handling the scraper and accessories. (n) The scraper can be worked successfully in low coal on a 40-ft. face. (o) The room neck and switch are left open for the mining machine when the loader leaves.

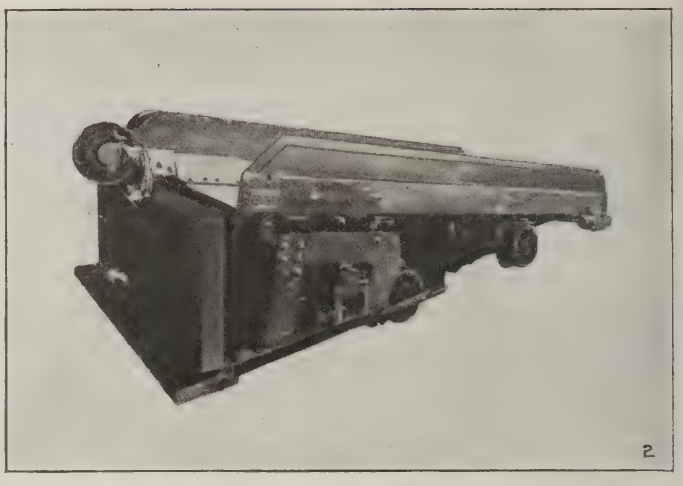
The following advantages and savings may be

effected by any mechanical loader: (a) The haulage system is concentrated; in other words, the daily output of coal loaded mechanically will be obtained in from one to four places, depending upon the length of the face and whether the system in use is a longwall, panel or room-and-pillar working. (b) The locomotives travel less territory for the same quantity of coal due to the concentration, thereby reducing the haulage costs. (c) A new mine could confine all operations to one definite section; after working out this part of the mine, the same steel, ties and trolley wire could be moved over to the new working faces; this, because no such scattered territory as is required by hand loading is necessary with a mechanical loader. In other words, there is need for only about one-fourth the number of working places for the same tonnage, consequently the extra development is not necessary. It readily can be seen that the saving in steel, ties, trolley wire and maintenance would be considerable if this system were followed. (d) The concentration of the workings due to the use of the mechanical loader means higher efficiency from the cutting machine, as the time lost in moving from place to place would decrease. The time gained could be utilized in actual work, thereby increasing the tonnage profits from each piece of cutting apparatus, as the only time it is making money for the owner is when the machine runner's helper is shoveling bug dust. (e) Places are worked out faster, which is an advantage when a mine has a tender top. The greater the speed of working out the place, the less the time for the roof to give trouble. (f) The chance of having to pay compensation is reduced from a minimum of one in two to a maximum of one in five. This, of course, all depends on the increased tonnage per man at any particular installation, for the fewer the men the less chance of injury. (g) The tonnage per man has been increased in many cases from the familiar figures of from 4 to 10 tons per man per day in hand loading to from 20 to 25 tons per man per day with the mechanical loader. (h) The decrease in the number of men for a given production also means that the present equipment of miners' houses and other facilities will serve for a large percentage of increase of output.

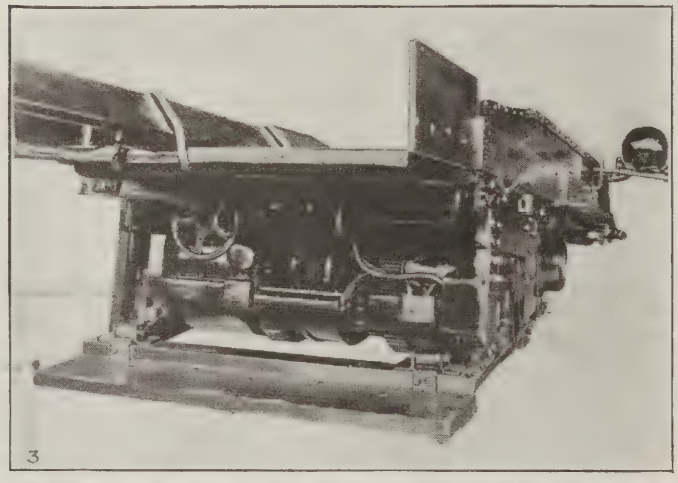
Where Scraper Has Advantages of Its Own

A scraper loader not only gives the foregoing advantages applicable to any mechanical loader, but in addition to these, the following: (a) The gathering haulage cost by use of scraper loader is further reduced as the mine car never leaves the entry. (b) A larger mine car can be used with the scraper loader, especially in low coal, as it always remains outside the working place. This not only means more tonnage per car and a saving in haulage cost, due to the larger car, but it also makes savings in oil, grease and maintenance, as there are only four wheels on a 3-ton car whereas there are twelve on three 1-ton cars. The initial investment would be less, because fewer cars are needed in a concentrated mechanical loading area than would be necessary in the scattered hand-loading territory. (c) The use of the scraper eliminates all necessity for track in the room for haulage purposes. This does away with the time lost due to wrecked cars on poorly laid room tracks. (d) The yardage cost is practically eliminated, for the scraper itself is only 18 in. high and as this is the largest moving part that enters the working place, no bottom need be lifted or top brushed in any room in which a man would be able to crawl to the face. (e) In dipping rooms the need for a small hoist to pull the loaded car from the face is obviated. The trouble caused by the miner losing control of an empty while going into a room also is eliminated. (f) In rooms driven to the rise the gathering locomotives need not enter the working place. The danger of a car getting away while being loaded also is eliminated. (g) More lump coal can be loaded in low coal seams where the height between the top of the car and the roof is small. This, of course, is due to the fact that the scraper pulls all the coal to the entry, where there is more height. The breakage of the coal due to the transporting in the scraper is practically nil, as the first few scraper loads in a new working place are composed of bug dust from the cutting machine, a small quantity of which will fill up any unevenness in the runway and act as a cushion for the remainder of the coal. (h) If a place caves at the face, there is no possibility of losing any part of the apparatus except possibly two jacks and sheaves, which may be replaced at low cost. (i) The time lost in replacing a loaded car with an empty is negligible, being made between the trips of the scraper. (j) The design can be kept simple, as a scraper loader does not need the multiplicity of moving parts necessary in a piece of apparatus which picks up and loads its own coal.

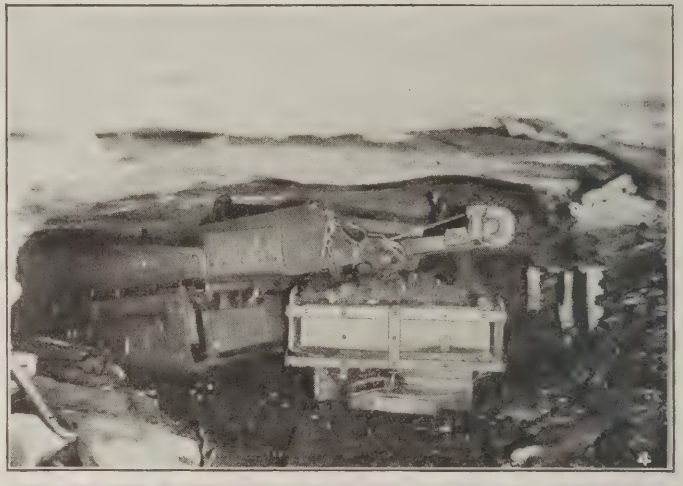




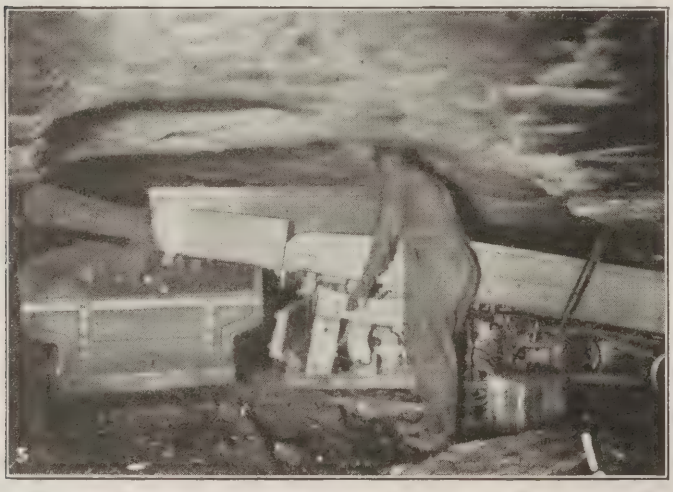
RECLAIMING STORED COAL BY SCRAPER LOADER



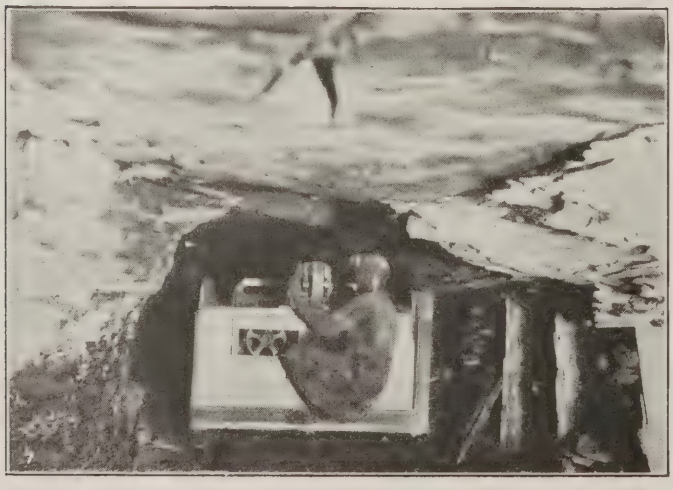
The coal can be not only reclaimed but also stored with a scraper loader. In this illustration the scraper can be seen pulling coal up to the chutes to be delivered by them to the cars in the ordinary manner. With this arrangement no slack cars need be left over from one day to the next.



The following are the conditions that will limit the production of mechanical loaders: (a) Impurities in coal seam so located that they mix with the coal when shot, thus delaying the loader; (b) inadequate car supply; (c) lack of proper support from mine officials. This failure to provide mechanical loaders with the facilities that should be afforded them can be attributed to the fact that a loader generally is installed in a section of the mine to itself. The bulk of the coal in most mines at the present time comes from the hand-loading section of the mine, hence where there is a shortage of cars the mechanical loader suffers, as it is natural for the mine foreman or haulage boss to throw all the favors to the sections producing the most coal. Later on, as the loader becomes established, the mechanical device will get its share of the cars. In other words, the more mechanical loaders there are, the better will be the service they will get.



The history of the development of the scraper loader



SCRAPER LOADING WITH LOCOMOTIVE CHUTE AND HOIST

(1) Gearing of hoist with chute removed. (2) Chute with head-pulley arm telescoped. This is a view of the completed hoist in its traveling position. It is self-propelling and self-contained and automatically sheaves the rope. (3) Loader with arm extended as seen from the heading side. Note the headlight on the machine which enables the operative to see the coal face. (4) Loading coal into car, the scraper being pulled up to the head pulley. (5) Hoist in position. Two short jacks hold the machine in place while loading. One of these can be seen in the illustration. (6) Loader leaving room neck carrying scraper. For transportation the scraper and other accessories are pulled into the chute by the winding engine. (7) Chute-hoist in the entry making its trip from room to room.

SCRAPER GATHERING COAL FOR SHIPMENT
Another view of the storage pile shown on a previous page. At this mine the operator during the depression had dumped 5,000 tons of coal in a pile which he was able to load out during the strike at a good profit.

is a repetition of the history of other mining machinery. The cutting machines passed through the same process of evolution and education. In the early days, to the skeptical mind, undercutting by machinery was impracticable, but today practically two-thirds of the coal produced in this country has been undercut by a mining machine.

The scraper loader has successfully passed through these various stages, and one point has been thoroughly demonstrated: To make a success of a loading machine in a mine, every effort must be made to keep the equipment working. Tonnage lost by any delay is irretrievably lost, because a loader loads at its maximum efficiency at all times. In other words, there is no possibility of speeding it up and regaining lost time.

With proper co-operation there is no doubt of the complete success of scraper loading. It has already proved its adaptability to widely varying sets of conditions.

The headpiece of this article shows a scraper being filled with coal. The illustration exhibits also how the sheave is placed by which the scraper is directed. The return rope can be detected at the rear of the scraper.

Coal Reserves in Armstrong County, Pa.

By John F. Reese

ARMSTRONG COUNTY, Pennsylvania, has six coal beds that are now of economic interest. In order of present importance as shipping coals they are the Upper Freeport, Lower Kittanning, Upper Kittanning, Lower Freeport, Pittsburgh and Brookville.

The extensive development and outcrop of the Upper Freeport bed throughout the county have furnished many measurements of its thickness, making possible an accurate estimate of quantity.

The percentage of this bed that can be recovered is governed by the sequence in which the Upper and Lower Freeport coals are mined. If the Lower Freeport bed is worked first and pillars are drawn, the overlying rocks will cave and break the Upper Freeport bed, thereby causing a partial and in many places complete loss of that coal. The Upper Freeport bed contains the second greatest reserve within the county and is the largest producer, yielding about 3,500,000 tons yearly.

Throughout the townships in the northern half of the county where the lower Kittanning coal outcrops a fair amount of information as to its thickness and persistency is available. For the townships in the southern half data are meager for purposes of calculation and a general average based on thicknesses in surrounding areas was adopted and a low percentage of recovery allowed because the extent and thickness of this bed are not known. This bed contains the greatest coal reserve within the county and ranks second in production with a total of over 1,500,000 tons annually.

Little information as to the extent and thickness of the Upper Kittanning bed is available, except from its recognized outcrop and development in a few localities. This bed is extremely variable as to section and thickness, attaining great height in local troughs or channels 200 to 300 yd. in width and thinning to 12 in. or less at trough limits. It is known as the "Pot Vein" because of this peculiarity. The Upper Kittanning bed in these troughs is a cannel coal, with 24 in. or less of bituminous coal under the cannel. Where available measurements show sufficient thickness for mining, the presence of small workable areas contiguous to the place of measurement has been assumed. The quantity of coal was computed from the average thickness of the bed in that vicinity. A low percentage of recovery has been adopted owing to the extreme variability of this bed and lack of knowledge of persistency and extent.

A fair number of measurements of the thickness of the Lower Freeport coal are available from its outcrop and development, making possible a fairly accurate computation of quantity. Little is known as to the extent and thickness over large areas and a general average based on thicknesses in surrounding areas has been used in calculations. A low percentage of recovery was adopted for this reason and because of the general "faulty" condition of the bed where this coal is mined.

The extensive development and outcrop of the Pittsburgh bed furnish a fair number of measurements of its thickness, thus making possible a reliable computation of quantity.

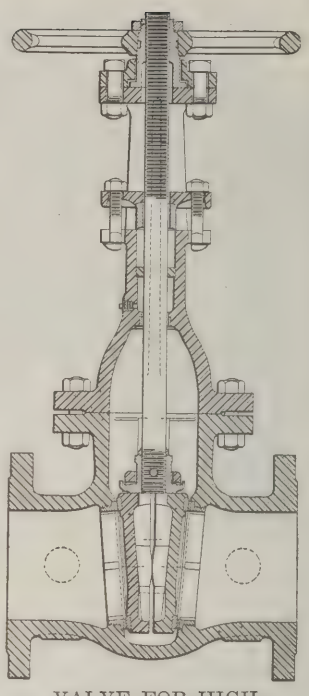
For some localities no information is available as to the mined-out areas of the various beds computed herein. For these places an estimate of probable depletion has been made based on age and size of operations, or on the difference between original areas and statements of acreages remaining unmined.

The result of computing the coal reserves within this area based on the latest maps, engineering data and methods is shown in the accompanying table.

COAL RESERVES IN ARMSTRONG COUNTY *

Bed	(In Net Tons) Original Deposit	Mined Out	Recoverable
Pittsburgh	17,500,000	13,900,000	2,800,000
U. Freeport	1,288,300,000	60,350,000	943,000,000
L. Freeport	607,000,000	5,000,000	387,100,000
U. Kittanning	131,500,000	4,500,000	69,900,000
L. Kittanning	1,541,200,000	23,510,000	1,001,000,000
Brookville	165,200,000	30,000	87,300,000
Total	3,750,700,000	107,290,000	2,491,100,000

* The area of Armstrong County is 682.2 square miles.



Steel Cast Valve with Monel Metal Parts For Use with High-Pressure Steam

INCREASING use of high pressure and superheat in modern power plants has been responsible for various improvements in the design of valves and fittings employed in the transmission and control of steam during recent years. In many instances not only has the design itself been improved but the substitution of materials better adapted to the purpose in hand than those ordinarily employed has resulted in a marked increase in utility.

The valve shown in the accompanying illustration is a case in point. In this valve a steel casting has been substituted for the cast iron usually used. No gaskets are employed, all joints under pressure being made with metal to metal surfaces. Aside from the fact that the body of this valve is a steel casting and all bearing surfaces coming in contact with each other within the valve body in controlling the flow of steam are made of monel metal, certain other details increase the utility of this piece of equipment. Among these might be mentioned a monel metal collar rolled into the upper portion of the bonnet against which the gate nut bears when the valve is open and a stuffing box of generous proportions, the gland being drawn down by means of bolts instead of the ordinary studs.

On this valve even the hand wheel is of steel casting with a rim so shaped and knurled as to give a firm hand hold.

Making the hand wheel of steel not only provides against breakage during shipment but also against breakage of the wheel when in use.

VALVE FOR HIGH PRESSURE STEAM

All joints under pressure have metal to metal surfaces, no gaskets being used.

Valves of this type, which are manufactured by the Reading Steel Castings Co., of Bridgeport, Conn., are made from steel of the following properties: Tensile strength 70,000 lb. per sq.in.; elastic limit, 35,000 lb. per sq.in.; elongation in 2 in., 30 per cent; reduction in area 25 per cent. The analysis of this material is approximately as follows: Carbon, 0.25 per cent; silicon, 0.35 per cent; manganese, 0.65 per cent; phosphorus, not over 0.045; sulphur, not over 0.040 per cent.

With a valve body of this type, should the piping in which it is placed be subjected to excessive stresses, the valve will throw such stress on to the expansion joints where it belongs. If these are not present, however, the valve is capable of assuming a certain amount of distortion without danger of failure. Valves of this kind are built for a working pressure of 350 lb. with a total temperature not exceeding 800 deg. F., or for a working pressure of 500 lb. at a temperature not exceeding 100 deg. F.

British Coal Mines Show Operating Loss In Figures for Quarter Ended in June

As a counter argument against the demand of British coal miners for increased wages the operators have issued figures for the quarter ended June this year, showing operating losses. The figures are as follows:

	Total	Per Ton
Proceeds of sales	£45,875,798	18s. 11.41d.
Net costs	45,910,483	18s. 11.58d.
Deficit	£34,685	0s. 0.17d.

Totals and the amounts per ton of the profits or losses in the different areas:

PROFITS

	Total	Per Ton
Northumberland	£92,480	0 8.18
Durham	411,398	1 1.41
South Wales	175,308	0 4.13

LOSSES

Yorkshire, Nottingham, Derby, Leicester and Warwick	£224,644	0 3.65
North Wales	48,840	1 8.02
Lancashire, Cheshire and North Staffordshire	168,775	0 8.78
South Staffordshire and Shropshire	43,903	2 8.99
Cumberland	36,306	1 10.58
Bristol	12,269	4 2.45
Forest of Dean	7,920	1 2.64
Somerset	8,048	1 2.09
Kent	14,667	3 4.80
Scotland	148,499	0 5.03

Production costs (in which wages were by far the largest item) varied considerably. Scotland was lowest with 16s. 3½d. per ton, and Bristol highest with 26s. 5d. For the country as a whole the figures are:

	Total	Per Ton s.	d.
Wages	£30,540,289	12	7.39
Stores and timber	6,005,714	2	5.77
Management, repairs, etc.	7,884,887	3	3.08
Miners' welfare fund	221,688	0	1.10
Royalties	1,477,190	0	7.32
Total costs	£46,129,768	19	0.66
Less proceeds of miners' coal	219,285	0	1.08
Net costs	£45,910,483	18	11.58

Numbers of employees and the output and earnings per man-shift worked during the quarter:

	Numbers Employed	Per Man Shift Worked: Output Cwt.	Earnings s.	d.
Northumberland	55,469	17.54	8	9.20
Durham	154,840	17.59	9	1.15
South Wales	211,009	16.77	9	8.29
Yorkshire, Nottingham, Derby, etc.	301,897	20.00	12	7.05
Lancashire, Cheshire and North Stafford	135,049	14.32	9	2.18
North Wales	15,708	12.82	8	0.19
South Stafford and Shropshire	6,651	16.13	7	4.27
Cumberland	10,164	13.94	9	11.31
Bristol	2,055	10.34	8	0.81
Forest of Dean	3,907	13.15	7	8.25
Somerset	4,503	13.05	8	9.12
Kent	1,511	20.73	12	9.35
Scotland	122,829	20.01	9	7.95
Great Britain	1,025,592	17.80	10	2.51

The total number of man-shifts worked during the three months was 59,831,062, and the number lost which could have been worked was 4,677,252.

THE COALS OF EASTERN KENTUCKY, when mixed with the proper proportion of low-volatile coal, are peculiarly suited to the manufacture of byproduct coke, states the Bureau of Mines, in Technical Paper 308, just issued. An investigation made by the engineers of the U. S. Fuel Administration showed that in 1917 87 per cent of the northeast Kentucky production, 52 per cent of the Hazard production, and 44 per cent of the production of southeast Kentucky was suitable for making such coke. Largely as a result of the expansion of the byproduct coke industry, the production of coal in eastern Kentucky has grown by leaps and bounds. In fact the field has developed more rapidly than any other major field. The average output for 1916-1920 was more than 13 times as great as the average for 1890-1900, whereas the growth in bituminous output as a whole during the same period was less than fourfold. One consequence of this extraordinary growth has been a development of mine capacity far in excess of the ability of the railroads to transport, so that eastern Kentucky is the scene of transportation difficulties whenever the demand for coal is active.

Problems of Operating Men

Edited by James T. Beard

Investigate Records of All Applicants for Certificates of Competency

Thoughts Suggested by Recommendations of Bureau of Mines Regarding Certification of Mine Officials — Investigation of Candidates' Records Needed

HAVING read with deep interest the various letters discussing the certification of mining officials and particularly the letter of Robert A. Marshall, *Coal Age*, Nov. 16, p. 799, regarding recent conferences on mine-safety-problems, I would like to offer a few comments on the subject.

The letter of Mr. Marshall refers to a circular that was recently issued by the Colorado Fuel & Iron Co., containing certain recommendatoins of the U. S. Bureau of Mines bearing on the matter of the certification of mine officials.

From the reading of the circular, as quoted by Mr. Marshall, it appears that the Bureau of Mines advocates the revoking of certificates of competency every five years. While this may be a good thing, it seems to me that some plan might be worked out by which certificates would be granted, to men who deserve them, without requiring repeated examinations.

Investigation of Candidate's Record Most Effective Plan

My opinion is that it would do more good to adopt some such plan than to require that the men shall submit to an examination, as to their fitness and qualification, each five-year period. This would, of course, require the careful investigation of the record of each certified official.

There is no question but that many incompetent men now hold certificates of competency that have been granted them by regularly appointed examining boards. If an investigation was to be made in regard to this condition, I think that much blame would be found to rest on the shoulders of the state authorities, including the members of examining boards.

Recommendations of Little Value

It will hardly be denied that, in the great majority of cases, very little investigation is made of the previous records of candidates who present themselves for examination. The recommendation as to character and habit, required by law in many states, is generally easily obtained and sufficient attention is seldom given as to its authenticity.

Would it not be well if all such recommendations were required to be properly certified before a justice of the peace, who would be responsible for its authenticity and correctness regarding the facts stated in respect to the character and habits of the applicant.

Examining Board Must Determine Capabilities of Candidates

One of the first questions that an examining board should consider, in acting on the application of a candidate for a certificate of competency, is the question of whether he is a capable man and has had the practical experience claimed. What is needed is men of practical experience, in addition to their theoretical knowledge of mining and reputable character and habits.

Allow me to suggest that the Bureau of Mines would do much good by establishing a short course in mining, conducted by correspondence. I believe such a course would help many worthy men in their struggle to obtain certificates of competency.

In reference to the proper investigation of the character and experience of candidates, it is my belief that the state mining department should make a rigid investigation of each man's record. To that end, the applicant for a certificate should be compelled to file his application with the mining department, say one year before he intends taking the examination.

Many Attempts Made to Deceive Examining Boards

One man with whom I was formerly acquainted, desiring to secure a first-class certificate and not having had the required experience in gaseous mines, undertook to substitute for that experience a subterfuge, by exposing himself, in a closed room, to an atmosphere charged with gas produced by the use of carbide and water placed in the room.

The idea of this man was to study the action of gas on the flame of a safety lamp and claim that his knowledge was obtained through actual experience in a mine generating gas. A little later, the man passed the examination required by law and received his certificate, which would not have been possible had a proper investigation been made of his previous record.

Another instance is that of a young man, a railroad employee who was out of employment, applying to the superintendent of a mine who was a friend of his and gave him work. In eight months' time the young man went before an examining board and was granted a first-class certificate. Had the examining board made any attempt to investigate the man's record and experience, the certificate would not have been given him.

Other cases could be cited showing the need of the rigid investigation of the records of all applicants for certificates; but I will only mention one more. A certain large coal company had a number of assistant foremen who they desired should secure certificates. About two months before the examination, in some mysterious fashion, these men received the questions to be asked and the maps to be ventilated by candidates in the coming examination. Strange to say these men passed the examination and were granted certificates.

In closing, let me say that if more attention was given to the qualifications of candidates for certificates our certified men would not need to have their certificates revoked and pass another examination at stated periods.

Electric Cap Lamp in Firebossing

Conditions requiring the use of cap lamps by firebosses—Safety lamp for testing, but electric lamp for light.

MOST firebosses will disagree with the statement made by O. G. Sharrer, writing in *Coal Age*, Nov. 30, p. 879, where he contends that "any official whose duties require him to test for gas in the mine should carry no other lamp than an approved testing lamp."

In this respect, Mr. Sharrer confesses that he is possibly out of date. He acknowledges that a large number of firebosses, today, carry electric lamps in their caps. The conditions under which he has been employed must have been decidedly different from conditions in the mine where I am working.

In my particular section, the chambers or chutes are very steep, pitching from 30 to 70 deg. In climbing these pitches, it is practically impossbile to carry a safety lamp in such a manner as to throw the light ahead and avoid

danger. When going up or down these chutes, one must use both hands to keep himself from falling.

These conditions require a man to carry a good light in his cap and there is no better lamp for that purpose than the electric cap lamp. An open light, would, of course, be out of the question for a fireboss. He must also have his safety lamp attached to his belt and use it for making the test for gas when he has reached the face.

Even when traveling the gangway, a fireboss can inspect the condition of the roof better and detect danger more quickly when he has a good cap lamp on his head. To my mind, for a fireboss to discard the electric cap lamp, in examining a mine, is to deprive himself of one of the best means of avoiding danger and making a thorough examination of his section.

During the past six years, my constant practice has been to carry an electric cap lamp on my head when making an examination of a mine. I believe this is as important as carrying a good safety lamp for testing for gas.

Before closing, allow me to say that I am opposed to the use of a flashlight in any place where firedamp may possibly exist. It is my opinion that every miner and mine laborer should be equipped with an electric cap lamp, since that will afford him the greatest degree of safety in his work.

Shickshinny, Pa. FIREBOSS.

Another Letter

REFERRING to the question of firebosses examining a mine when carrying an electric cap lamp on their heads, exception to which is taken by O. G. Sharrer, in his letter, *Coal Age*, Nov. 30, p. 879, I want to say that my previous claim of such being the present-day practice of a large number of firebosses can readily be confirmed by any who care to investigate further.

It was always my practice, while firebossing in a certain mine that I am safe in saying will certainly prove a difficult proposition for firebosses in the future. The roof in that mine was very poor, as it was in all the mines, in that district, working the same seam. Little attention was given to the future development of the mine and it required no prophet to see breakers ahead and know that a large amount of coal would be lost beyond recovery.

ELECTRIC CAP LAMP AN ESSENTIAL REQUIREMENT

Under the conditions prevailing throughout that district, it is my claim that one essential requirement of firebossing, in those mines, was to provide the best possible light and carry that light on the head, where it would be in the best position to reveal the condition of the roof and enable a fireboss to detect any loose top, faults and other dangers.

The following are some reasons why a good light is essential in firebossing. First, it is necessary to insure the man's own safety; and, second, it is absolutely necessary to the making of a thorough inspection of the mine that will make it safe for work.

The best testing lamp in use gives but a poor light as compared with that of an electric cap lamp. Moreover, the form of a safety lamp is not convenient for throwing the light on the roof where it is most needed in the detection of dangers such as a fireboss is seeking to find. In canting a safety lamp to one side so as to better throw the light on the roof, there is danger of smoking or cracking the glass.

Of all those who work in coal mines, the fireboss has the most need of a good light and the electric cap lamp best meets that requirement. If only for the purpose of lessening the strain on the eyes and avoiding the disease known as "miner's nystagmus," which is so common among firebosses, an electric cap lamp should always be carried when making an examination.

FAILING EYESIGHT OF FIREBOSSES

How many firebosses, on reaching forty or fifty years of age, find themselves incapacitated by reason or their failing eyesight. To such an extent has this been the case in Great Britain, that it is not uncommon for the older firebosses, in that country, to be ordered to get employment on the surface; and, in some cases, I believe, they have been pensioned. These older men, by reason of their mature judgment and experience are needed in the work of firebossing. Young firebosses are apt to be overconfident and make mistakes that the older men have learned through sad experience to avoid.

Some time ago, I was engaged with another man in repairing some stoppings that had been blown out by an explosion. Observing that I kept a watchful eye on my safety lamp, hanging on a timber nearby, my buddy asked the reason and I explained to him how the lamp was my friend, warning me of the danger should gas be present. In another way, though equally true, I have found the electric cap lamp a friend.

When making a test for gas, in order to avoid the bright glare of the light interfering with the accuracy of observing the flame cap in the safety lamp, my practice was to hide the electric light under the bib of my overalls. This became a natural habit of mine when making a test for gas.

Linton, Ind. W. H. LUXTON.

Herrin Murder-Trial Jury

Correcting a wrong statement regarding personnel of jury as being one-half miners. Jury said to include but one miner.

IT WAS with much surprise that I read the statement in *Coal Age*, Dec. 14, p. 964, regarding the make-up of the jury that is to try the men indicted for murder in connection with the Herrin massacre last June.

Speaking of the jury as completed, it is stated, "The twelve are more than half miners." Living in this vicinity as I do, it is my privilege to know, personally, the majority of the men on this jury and their several occupations.

In justice to the county officials and the honor of the State of Illinois, it should be known that the statement quoted above is very wrong. To my knowledge, there is but one miner on the jury, in spite of the efforts made by the defense to pack the jury with such men.

To corroborate this fact reference is made to the clerk of the court, at Marion, Ill. I know that *Coal Age* will gladly correct this error.

Benton, Ill. C. E. CHILDERS.

Mine-Track Switches

Providing a good roadbed — Size of track ties and rails important—Keep all switches clean to avoid derailment of cars.

LOOKING through the pages of *Coal Age*, from week to week, I have found it a great help to me in my work. The inquiry in regard to calculating the dimensions of switches and turnouts was of particular interest, Nov. 16, p. 801.

My experience in reference to mine-track switches leads me to suggest that it is of the utmost importance to provide a good roadbed. The track must be well ballasted and kept drained, if the best results are to be secured. Without these requirements, it is not possible to maintain good track conditions.

The size of the track ties and weight of rails used are also important, depending on the weight of the locomotives employed and capacity of the mine cars. With a 10-ton locomotive, hauling 2-ton cars, we are using 35-lb. steel rails laid on 4 x 6 in. ties. The frogs of all switches are made to match the rails.

One thing that must not be forgotten is the importance of keeping all mine switches clean and free from coal that falls from the cars. Unless this is done, good equipment will not suffice to prevent the derailment of cars or locomotives. ELBERT ROE.

Fork Ridge, Tenn.

Trackage in Mines

Many accidents due to poor mine tracks—Delays owing to derailment of cars cause loss in production—Instance of a mine visited.

FEW items affect both the tonnage and the cost of production of coal to the same degree as the trackage system in a mine. One cannot fail to be impressed with the importance of this fact, in reading D. C. Ashmead's account of what is being done in anthracite mines to lessen derailments, *Coal Age*, Nov. 30, p. 872.

An examination of the conditions existing in a majority of our coal mines will disclose to the most cursory observer the hindrance that a bad trackage system is in the operation of the mine. The trouble may be due to an insufficient number of ties to support the rails; or the use of too light

rails for the weight of locomotives and cars hauled over them.

Bad bonding of rails, cars in poor condition, lack of efficient arrangement of tracks, or want of a proper schedule in haulage may each or all play their part in the final result. An improperly laid track is a great drawback in the production of coal. When a car is derailed the entry may be blocked for an hour or more before the car can be again placed on the track.

Good Track Ties Important

Trouble is often due to the track ties being spaced too far apart; or they are too light for the traffic. My practice has been to space the ties not more than 4 ft. apart, in rooms, and from 2 ft. 8 in. to 3 ft. apart, on the main roads. Wherever the track is curved and on all turns and switches, the ties should be placed nearer together, say not exceeding 18 in. or 2 ft., cen. to cen., at the most.

All track ties must be of sound timber and my preference is to use sawed ties, instead of round timber. An important consideration is to use good cars mounted on good rolling stock. In laying track, it is always bad practice to use too sharp a curve.

Under favorable conditions, where proper attention has been given to the planning of a good trackage system and a good schedule is maintained in haulage, there is no reason why a maximum output should not result. There is no economy in attempting to save expense by using poor material or too small an amount of it when installing a trackage system in a mine. The entire system must be planned with respect to the desired output and the equipment in use.

A Poorly Managed Mine

Not long ago, I visited a mine that had a daily output of about 1,200 tons. On the main road, from the inby parting to the shaft bottom, the track was in good condition and could not be improved. On the cross-entries and on all the gathering hauls, however, the track conditions were very poor.

In this portion of the mine, the ties were not only of inferior quality but they were spaced too far apart, particularly as they were of hewed timber. It seems strange to me that, with the main road in such excellent condition, in this mine, more attention should not have been given to the tracks in the workings.

It will cause no surprise when I say delays in the mine were frequent and prolonged, because of the inability of the drivers gathering the cars at the face, to put the coal on the parting as quickly as the locomotive hauled it to the shaft bottom.

In my opinion, had proper attention been given to the tracks on the cross-entries and the gathering hauls, the output of this mine could have been increased from 1,200 to 1,400 tons a day. No argument is needed to press home the lesson the incident teaches.

Hillside, Ky. O. Kennett.

Inquiries Of General Interest

Calculating Weight of Water in Air Current

Humidity of Intake Air Estimated from Reading of Dry- and Wet-Bulb Thermometers—Weight of Water, Per Cubic Foot of Air, Determined by Temperature and Degree of Saturation

RECENTLY we have been much interested in determining what weight of water is carried into our mine by the air current, under varying conditions. A current of 150,000 cu.ft. of air per minute is passing into the mine. Readings taken with the hygrometer, in the intake airway, on different occasions, gave the following results: Dry bulb, 50 deg. F.; wet bulb, 48 deg. F.

Again, the readings taken were: Dry bulb, 44 deg. F.; wet bulb, 43 deg. F. I am anxious to ascertain the manner of calculating the percentage of moisture, or degree of humidity of the air and the actual weight of water carried into the mine as indicated by these readings. Also, let me ask, what portion of this moisture will be deposited from the air on its passage through the mine?

Lochgelly, W. Va. Mine Foreman.

The percentage of moisture in the air, or the degree of humidity, is the ratio that the actual vapor pressure bears to the saturated vapor pressure, at the given temperature. In order to make this calculation, in any given case, it is necessary to have at hand a table showing the saturated vapor pressures, for different temperatures. Such a table is found on page 77, *Mine Gases and Ventilation*, second edition.

Having this table, the actual vapor pressure, for any given temperature, can then be calculated from the saturated vapor pressure given in the table. The actual pressure is always less than the saturated pressure, by an amount that varies with the barometric pressure and the difference in the temperatures indicated by the dry- and wet-bulb thermometers. The calculation is made by the use of the following formula:

$$p_v = p_w - \frac{B}{30}\left(\frac{t_d - t_w}{88}\right)$$

Applying this formula to the first set of readings given by the correspondent and assuming a barometric pressure, in this case, of $B = 29.4$ in., the saturated pressure taken from the table, for the wet-bulb temperature, being $P_v = 0.3352$ in., we have for the actual vapor pressure,

$$P_v = 0.3352 - \frac{29.4}{30}\left(\frac{50 - 48}{88}\right) = 0.3129 \text{ in.}$$

In this case, therefore, the saturated vapor pressure for the dry-bulb temperature (50 deg.) being $p_{50} = 0.3610$ in., the percentage of moisture or degree of humidity of the air is, $H = (100 \times 0.3129) \div 0.3610 = 86.68$ per cent.

For the second set of readings, dry bulb 44 deg., wet bulb 43 deg., we will assume a barometric pressure of 29.5. In this case, the corresponding saturated pressures, as taken from the tables, are $p_{44} = 0.2885$ in.; and $p_{43} = 0.2777$ in. Then, the actual vapor pressure is

$$p_v = 0.2777 - \frac{29.5}{30}\left(\frac{44 - 43}{88}\right) = 0.2665 \text{ in.}$$

In this case, therefore, the percentage of moisture or degree of humidity is $H = (100 \times 0.2665) \div 0.2885 = 92.39$ per cent.

It now remains to calculate the weight of water vapor, per cubic foot of air. For this purpose, the formula giving the weight of a cubic foot of air is multiplied by the specific gravity of water vapor (0.6235); and the actual vapor pressure is substituted for the barometric pressure. Thus, for a dry-bulb temperature of 50 deg. and an actual vapor pressure of 0.3129 in., we have for the weight of water contained in a cubic foot of air,

$$w = 0.6235\left(\frac{1.3273 \times 0.3129}{460 + 50}\right) = 0.00051 \textit{ lb., nearly.}$$

Under these conditions, an air current of 150,000 cu.ft. per min. will carry into the mine $150{,}000 \times 0.00051 =$ say 76 lb. of water per minute; or $(60 \times 76) \div 2{,}000 = 2.28$ tons per hour.

Again, for the second set of readings, dry bulb 44 deg., actual vapor pressure 0.2665 in., the weight of water vapor, per cubic foot of air, is

$$w = 0.6235\left(\frac{1.3273 \times 0.2665}{460 + 44}\right) = 0.00044 \textit{ lb., nearly.}$$

Under these conditions, the weight of water vapor carried into the mine by an air current of 150,000 cu.ft. per min. is $150{,}000 \times 0.00044 =$ say 66 lb. per min.; or $(60 \times 66) \div 2{,}000 = 2$ tons nearly.

In neither case, will the moisture carried into the air by this air current be deposited in the mine. First, the air is not saturated at the temperatures given. Again, the mine temperature being generally higher than that of the air entering the mine, the capacity of the current for absorbing moisture will be increased, with the result

that the air will exert a drying action in the mine and absorb more moisture in its passage through the workings.

In the humidification of a mine, attention to which has been drawn, recently, in *Coal Age*, the only practical method is to raise the temperature of the intake air by causing it to pass over steam coils installed in the airway. At this higher temperature, the steam issuing from the pipe is rapidly absorbed by the air, which thus becomes saturated at a temperature much higher than that of the mine. As a result of being cooled in its passage through the workings, the air current will then deposit much of its moisture in the mine.

Examination Questions Answered

Indiana Hoisting Engineers' Examination, Indianapolis, 1922

(*Selected Questions*)

QUESTION—*What do you consider the proper level at which to carry water in a boiler? Give reason for your answer.*

ANSWER—The water level in a boiler should show about a two-thirds glass. That will give an ample margin between a high- and a low-water mark. If the water level in the boiler is too high, not only may priming result, by which is meant the passage of some of the water over into the cylinders of the engine; but the steam space above the water is reduced and the steaming capacity of the boiler correspondingly lessened. On the other hand, if the water level is too low there is danger of the overheating of the boiler plates, exposed to the heat of the furnace, above the water line.

QUESTION—*What effect does the size of the drum have on the life of a hoisting rope?*

ANSWER—Increasing the size (diameter) of the drum lengthens the life of the rope, by producing a less bending stress when the rope is wound on the drum. The bending stress forms part of the live load that the rope must carry. Therefore, as the bending stress is increased, the net load hoisted is proportionately decreased. It is a good rule to make the diameter of the drum from 75 to 100 times the diameter of the rope. A hoisting drum on which a six-strand, nineteen-wire, steel hoisting rope is to wind, should be at least sixty times the diameter of the rope.

QUESTION—*Where should a rope be most carefully watched and how would you examine a hoisting rope to determine that it is safe?*

ANSWER—That portion of the hoisting rope next to the coupling by which it is fastened to the cage requires the closest inspection, owing to its being subjected to harder service and more severe strains than other parts of the rope, especially when starting the cage from the bottom of the shaft too suddenly. A hoisting rope must be carefully examined, at brief intervals, to detect any possible broken wires. For that purpose, the engineer should be instructed to hoist the cage slowly, while the inspector allows the rope to pass through a bunch of waste held in his hand. At the same time, any undue wear of the wires forming the strands must be observed closely.

QUESTION—*Explain what is meant by alternating current and how it differs from direct current, as applied to electric power.*

ANSWER—An alternating electrical current is one where the arrangement is such that the direction of the current is changed, at regular short intervals. Direct current is one in which the flow is continuous in one direction. The former is capable of giving a more severe shock to the human system and requires less copper, for the transmission of the same power over equal distances, than what is required in the use of direct current.

QUESTION—*What causes scale in boilers and what means would you adopt to keep the same from accumulating?*

ANSWER—Scale is formed in boilers by the consolidation and hardening of the sediment and other impurities contained in the feedwater. The impurities are most commonly the carbonates of lime and magnesia, together with the sulphates of these elements and the sulphide of iron.

The formation of scale in boilers is greatly reduced by purifying the feedwater before it enters the boiler. Much of the impurities can be precipitated by heating the water in feedwater heaters. Where feedwater contains much sediment this may be removed by filtration or precipitation. Again, to prevent the accumulation of scale, boilers in constant use should be blown off, partially, at regular short intervals. Mud drums are most effective in collecting the sediment contained in the water and removing it from the boiler.

QUESTION—*What are the dangers to be watched for in boilers producing scales?*

ANSWER—Where scale forms readily, in boiler practice, there is always danger of overheating the boiler plates. The scale formed within the boiler impedes the transmission of the heat of the furnace to the water in the boiler and lessens the production of steam. This has a tendency to forcing the fire under the boiler and burning the plates or forming blisters that are dangerous. Excessive firing, under these conditions must be carefully avoided.

QUESTION—(*a*) *What is meant by an open circuit?* (*b*) *A closed circuit?* (*c*) *A grounded circuit?* (*d*) *A short circuit?*

ANSWER—(a) An open circuit is a wiring system in which the flow of the current is prevented by reason of an open switch.

(b) A closed circuit is any system of conducting material through which a current of electricity is flowing. It is immaterial whether the conducting material is wire or the ground, or other substance, just so the current will flow through it.

(c) A grounded circuit is one where a portion or all of the current passes into the ground through a connection with the wiring system. In many instances, a ground current is made to take the place of the return wire of the system.

(d) A short-circuit is any failure of the current to traverse the entire system intended, owing to an accidental connection being made at some intermediate point in the system, whereby the length of the circuit is shortened.

QUESTION—*Give five reasons why a steam pump will not discharge water out of a mine.*

ANSWER—Assuming the pump is located in the mine, there are numberless reasons to account for its failure to discharge water from the mine. The sump may be dry. There may be a lack of adequate steam pressure to overcome the water head and the friction head, against which the pump must operate. The pump may need to be primed, in order to start its action. The pump may need repacking to reduce the excessive slippage of water past the piston. Sediment in the water may have choked the valves, or the valve seats may need regrinding to prevent leakage. There may be an obstruction in the discharge pipe, or in the suction pipe; or these may not be of sufficient size or badly corroded.

QUESTION—*Give five reasons why a hot-water feedpump will not pump water into a boiler.*

ANSWER—The chief source of trouble in pumping hot water is due to the vapor pressure in the hot water counteracting, to that extent, the barometric pressure and thus reducing the suction lift of the pump. The pump may not be properly designed to enable it to force water into the boiler against the boiler pressure, when using the latter to operate the pump. A feedpump may be set too low, thereby increasing the head of water against the pump. The pump valves may not be working properly, or otherwise obstructed. The pump may be set too far from the boiler and unable to overcome the friction of the pipe connecting it thereto.

Electric Power Spreads in Coal Fields Of Eastern and Western Kentucky

One of the most interesting developments in 1922 in the coal districts of both eastern and western Kentucky was the spread of power and lighting service by companies supplying current to numerous small mines, at a big saving in cost of mining equipment. The Kentucky Utilities Co., which is operating in both the eastern and western Kentucky coal fields, has made great progress in developing mine-power facilities.

The company reports that in Harlan and Bell counties alone it has a 30,000-hp. connected load, and with the throwing of a single switch could stop 30,000 tons of daily production. One power plant is at Varilla, Ky., on the Cumberland River, and another at Pocket, Va. This represents seven years of development and about 500 miles of transmission line.

In western Kentucky 23 miles of additional transmission line is being completed, giving the company close to 200 miles there. Besides other plants the company is taking the surplus power from the St. Bernard Mining Co., which has a fine new 6,000-kw. power plant, and the surplus of the W. G. Duncan Mining Co.'s 6,000-kw. plant. These mines consume only a small portion of their capacity and sell the balance, in turn buying from the power company current for distant mines. These plants are of the latest type, turbine equipped.

Ninety-two miles of transmission line has been placed in service in western Kentucky in the last fourteen months. The Kentucky Utilities Co. is now serving mines, towns, farms, etc., over a wide area, 80 per cent of the power furnished being for purposes other than city service. Such towns as Greenville, Farlington, Madisonville, Hickman, Fulton, Clinton, Central City, Drakesboro, Bevier, Irvington, Dawson Springs, Hopkinsville and Princeton are now getting their power from this company.

In the larger units in both eastern and western Kentucky power is being produced at the mouth of the mines. Coal is chuted or dumped direct from cars to magazines or hoppers at the power house, saving all transportation charges and giving a ready outlet to a considerable amount of screenings in some instances, as the plants are equipped with modern stoking devices for handling small sizes.

Accidents in November Killed 365 Miners, 6.80 per Million Tons Produced

Accidents at coal mines in November caused the death of 365 men, according to reports received by the U. S. Bureau of Mines from state mine inspectors. This number includes 181 deaths in four major disasters that occurred during the month. The fatality rate for November was 6.80 per million tons of coal produced, as compared with 3.46 per million tons produced in October, 1922, and 3.60 per million tons for November a year ago. The average fatality rate for November during the past nine years (1913-1921) is 3.79 per million tons, based upon an average of 183 fatalities.

During the year 1922, to the end of November, 1,762 men were killed by accidents at coal mines, as compared with 1,823 fatalities during the first eleven months of 1921. The smaller number of lives lost during 1922 was due to the five-months' closing down of all mines affected by the miners' strike which lasted from April to August. In relation to the quantity of coal produced, the eleven-month death rate in 1922 was 4.34 per million tons, as against 3.89 for the same period in 1921.

The increased fatality rate in 1922 was due almost entirely to the heavy loss of life in explosions of gas and dust. The rate for this group of accidents was 0.742 per million tons as compared with 0.192 in the corresponding eleven months last year. The eleven-month rate for falls of roof and coal was 1.962 for 1922 and 2.004 for 1921. The rate for haulage was 0.749 as compared with 0.685; that for electricity was 0.166 as against 0.164. Fatal accidents from explosives have declined from a rate of 0.318 per million tons in 1921 to a rate of 0.201 during the year just closed.

COAL-MINE FATALITIES DURING NOVEMBER, 1922, BY CAUSES AND STATES

(Compiled by Bureau of Mines and Published by *Coal Age*)

State	Underground													Shaft					Surface								Total by State	
	Falls of roof (coal, rock, etc.).	Falls of face or pillar coal.	Mine cars and locomotives.	Gas explosions and burning gas.	Coal-dust explosions (including gas and dust combined).	Explosives.	Suffocation from mine gases.	Electricity.	Animals.	Mining machines.	Mine fires (burned, suffocated, etc.).	Other causes.	Total.	Falling down shafts or slopes.	Objects falling down shafts or slopes.	Cage, skip, or bucket.	Other causes.	Total.	Mine cars and mine locomotives.	Electricity.	Machinery.	Boiler explosions or bursting steam pipes.	Railway cars and locomotives.	Other causes. I. C. C. Issues Service Orders 33 and 34

Due to failure of the Baltimore & Ohio R.R. to furnish adequate cars to the West Virginia Northern R.R. Co. and the Indian Creek Valley Ry. for the shipment of coal for the U. S. Navy the Interstate Commerce Commission issued on Jan. 6 Service Order 33, effective Jan. 9, directing that the B. & O. assign cars to certain mines, to be counted against their allotment, as follows: Three cars per day for nine consecutive working days to the Lucky Jack Mine of the Lucky Jack Mining Co., Snyder, W. Va.; ten cars per day for nine consecutive working days to the Lambert Mine of the Bonafield Coal Co., Tunnelton, W. Va.; two cars per day for nine consecutive working days to the Victory Mine of the Victory Coal Co., Tunnelton, W. Va.; four cars per day for nine consecutive working days to the Freeport Mine of the H-D W. Coal Co., Tunnelton, W. Va.; eight cars per day for nine consecutive working days to Borgman Mines No. 1 and 2 of the Borgman Coal Co., Tunnelton, W. Va.; three cars per day for nine consecutive working days to Borgman Mine No. 3 of the Borgman Coal Co., Tunnelton, W. Va.; five cars per day for twenty-seven consecutive working days to the Kimmel Mine of the Howard Coal Co., Davistown, W. Va.

In Service Order No. 34, issued Jan. 6 effective Jan. 9, the Pennsylvania R.R. is instructed to assign eight cars daily for fifteen consecutive working days to the Ann mine of the Oakville Coal & Coke Co., at Latrobe, Pa. The coal is for Army use. The cars are to be counted against the mine's allotment.

Searles Heads Pennsylvania Coal & Coke Corporation; Watkins Resigns

J. W. Searles, who was vice-president and for several years in charge of sales of the Pennsylvania Coal & Coke Corporation, has been elected president of that corporation to succeed T. H. Watkins, who resigned. This announcement was made on Jan. 3 when it also was stated that as a result of negotiations extending over a period of several months, the Pennsylvania Coal & Coke Corporation has acquired all the property and assets of the Watkins Coal Co. It also was announced that T. H. Watkins has disposed of a large amount of his stock in the Pennsylvania Coal & Coke Corporation. His son, C. Law Watkins, will act as vice-president in charge of operations.

A. G. Edwards, secretary and treasurer, who has been associated with T. H. Watkins for more than thirty years, also retired, being succeeded by E. B. Houser. Mr. Watkins also retired as a director of the corporation.

The Pennsylvania Coal & Coke Corporation owns in fee or has under lease more than 40,000 acres of coal in Cambria, Blair, Indiana and Clearfield Counties, Pennsylvania, and negotiations have been about concluded for the acquisition of other lands which, with the Watkins Coal Co. properties, will give the corporation ample reserves.

J. W. SEARLES

Mr. Searles has been with the Pennsylvania Coal & Coke Corporation and its predecessors for more than twenty years, having joined the staff of the Webster Coal & Coke Co. in 1901. In June, 1921, he was made vice-president in charge of sales.

Summary of Statistics of Coal in West Virginia, Fiscal Years 1921 and 1920

	For Year Ending June 30, 1921	For Year Ending June 30, 1920	Increase of 1921 Over 1920	Decrease of 1921 Under 1920
Counties in which coal is mined on a commercial scale	35	35	.....	.....
Firms operating on a commercial scale	993	882	111	.....
Openings of all kinds subject to the mining law	1,570	1,440	130	.....
Gross tons pick-mined coal from commercial mines	21,028,617	22,937,433	.....	1,908,816
Gross tons machine-mined coal from commercial mines	59,032,987	56,053,883	2,979,104	.....
Total gross tons of coal from commercial mines	80,061,604	78,991,316	1,070,288	.....
Estimated gross tons of coal from small mines	700,000	1,000,000	.....	300,000
Total gross tons of coal from all mines	80,761,604	79,991,316	770,288	.....
Gross tons of coal converted into coke	1,257,065	1,872,355	.....	615,290
Net tons of coke manufactured	836,728	1,172,217	.....	335,489
Total value of coal at the mines (gross tons)	$375,541,458.60	$271,970,474.40	$103,570,984.20	.....
Total value of coke manufactured (net tons)	$8,015,854.24	$7,455,300.12	$560,554.12	.....
Value of a ton of coal at the mines (gross tons)	$4.65	$3.40	$1.25	.....
Value of a ton of coke at the ovens (net tons)	$9.58	$6.36	$3.22	.....
Mining machines in use	3,847	3,542	305	.....
Average number of coke ovens in use	3,955	4,232	.....	277
Days mines were in operation	155	182	.....	27
Days ovens were in operation	144	162	.....	18
Pick miners employed in commercial mines	17,140	14,385	2,755	.....
Machine operators and miners employed in commercial mines	45,574	34,547	11,027	.....
Underground laborers in commercial mines	32,778	28,052	4,726	.....
Outside employees connected with commercial mines	20,184	19,237	947	.....
Coke employees	1,050	1,205	.....	155
Total persons employed at commercial mines and coke ovens	116,726	97,426	19,300	.....
Persons killed	346	320	26	.....
Persons injured non-fatally	842	848	.....	6
Persons employed for each man killed	338	311	27	.....
Persons employed for each man injured	139	115	24	.....
Tons of coal mined in commercial mines for each fatality	231,392	246,845	.....	15,453
Tons of coal mined in commercial mines for each non-fatality	95,085	93,150	1,935	.....
Wives left widows	103	177	.....	74
Children left fatherless	232	385	.....	153
Acres of coal worked out	10,405	9,618	787	.....
Tons of coal produced in commercial mines per miner, pick and machine miners included	1,227	1,615	.....	388
Average earnings of each pick miner per year	$1,165.65	$1,451.45	.....	$285.80
Average earnings of each pick miner per month	$97.14	$120.95	.....	$23.81
Average price per gross ton of mining run-of-mine coal	$0.95	$0.91	$0.04	.....

Commission Urges Continuance of Present Wage Scale Until 1924, if Necessary to Avert Mine Tie-Up

By Paul Wooton
Washington Correspondent of *Coal Age*

By far the most important step taken by the President's Coal Commission was its action on Jan. 4 in telegraphing P. H. Penna and William Green, chairman and secretary, respectively, of the joint wage conference in Chicago, asking for the continuance of present wage scales for one year if efforts to reach an agreement should fail. The text of the commission's telegram follows:

"The Congress of the United States, charged with the duty of legislation for the general welfare of the American people, has created the United States Coal Commission to investigate the coal industry and to report the facts which it may find and to make recommendations to assist the legislative branch of our government in its efforts to guarantee justice to all concerned, to stabilize the industry and to keep the mines in uninterrupted operation.

"This commission has not yet had time to ascertain the facts nor to reach any conclusions as to the merits of your controversies, but it is satisfied that delay in reaching an agreement is bad for the whole country and that every interested party would suffer a greater economic loss by the closing of your mines even for a comparatively short period than would be sustained by a continuance of your present agreement until April 1, 1924.

"If, therefore, all other efforts to reach an agreement fail, the commission urges you, in the interest of the common welfare, to continue your present arrangement until April 1, 1924, by which time this commission expects to have found and reported fully all the facts over which your disagreements have arisen, with recommendation to the Congress, and by which time the Congress will have had opportunity to consider and take such action in the premises as it may deem wise."

Penna Replies to Hammond Telegram

To this message Mr. Penna replied as follows:

"Your telegrams dated Jan. 2 and Jan. 4 addressed to the joint Reorganization Committee of Bituminous Coal Operators and Coal Miners were given serious consideration by the operators in their meeting here today, after they had failed in their effort to reach an agreement with the miners upon a method for future wage-scale making. The joint conference made earnest, serious and sincere effort to reach an agreement. The cumbersomeness of a nation-wide conference of bituminous-coal operators and coal miners representing fifteen producing districts made success impossible. The diversity of opinion and the divergence of interests in such a gathering is obvious to any competent observer. The operators' proposal to the conference was the only one upon which agreement could be reached among themselves. We believe further it offered a practical and practicable solution of our difficulties. We regret that the miners could not agree with us on this proposal. No other solution could come from this conference. As to renewal of the present arrangement with the miners, as requested by your telegram dated Jan. 4, a reading of the Cleveland agreement with the miners dated Aug. 15, 1922, will disclose that the present conference has no power, jurisdiction or authority to take such action. The conference or conferences to consider this matter comes subsequent to the adjournment of this meeting. The arrangement of such conferences is being given consideration at this time."

The text of Mr. Green's answer follows:

"Your telegram directed to me as secretary of the Reorganization Committee was read to the conference of coal operators and miners. Each side decided to make reply. Both groups decided to make separate reply thereto. The United Mine Workers representatives were profoundly impressed with the advice and suggestions transmitted through your message. Unfortunately because of the diversity of interests represented in the conference it was impossible to reach an agreement upon the form and character of a wage-scale conference. You can be assured, however, that the situation is not hopeless but on the contrary it is reasonably certain that a wage-scale conference will convene before the end of this month. The United Mine Workers will diligently endeavor to reach a settlement of the wage scale at the earliest possible date."

Opinion is much divided as to the wisdom of the action of the commission in sending its telegram. Some operators are of the opinion that a continuance of the existing scale of war wages represents the maximum which the mine workers hope to get. If the commission sides with the mine workers in that demand, there is little question as to such an agreement being made, it is argued. The continuance of the existing wage scale, however, these operators say, precludes the possibility of the public's getting cheaper coal and means that many operators in the union field will be forced into bankruptcy. It can be said, however, that this appears to be the minority opinion. Apparently the majority of the operators and most of the public prefer the continuance of the present wage scale rather than to take chances with a strike at a time when the country will be without reserves of coal.

Telegram Was Result of Careful Consideration

It is known that the commission carefully weighed the probable effect of its telegram before it was sent. On the day following the despatch of the telegram it was evident that Commissioners Hammond, Marshall, Smith, Alschuler and Howell, who were present at the conference with the newspaper men on that day, had no cause to think that a mistake had been made. They were strengthened in that attitude by the telegram from a coal operator in whom the members of the commission have the greatest confidence. That telegram read: "The commission's advice to the conference has had a definite, sobering effect and will culminate in the acceptance of your recommendation shortly."

There are those who look on the action of the commission as the beginning of mediation in the wage dispute. The first act of any mediator is to try to maintain the status quo. That is what President Harding did last summer. It is admitted generally that it constitutes a departure from fact finding and may alienate some of the co-operation which has been forthcoming from the operators. The full co-operation of each side undoubtedly could be maintained were the commission to stick religiously to fact finding. Commissioner Howell stated positively, however, to the correspondents that the principal aim of the commission thus far has been the prevention of a strike on April 1. Each of the five commissioners present emphasized on several occasions during the interview that the probabilities all favor an agreement of some kind that will prevent the strike.

Chairman Hammond stated that he sensed in the public mind a suspicion that an agreement would be delayed as long as possible so as to continue the uncertainty and make it possible to sell coal at higher prices. He declared, however, with apparent determination that the commission would pillory any interest responsible for delaying an agreement so as to affect prices. He made the point that the commission is not suggesting how an agreement is to be reached but is interested in action which will prevent a strike next April.

Commissioner Howell made the point that an analysis of the present price of coal would reveal that any reduction in the wage scale, within the range of possibility, would form a small item going into that cost.

Governor Marshall made a plea for constructive handling of the coal situation and of the commission's doings in the articles written for publication. He asked the correspondents not to throw a monkey wrench in the machinery

in the hope of obtaining big headlines on what they write.

Although the administration has been watching events closely, especially efforts to bring coal producers and miners together amicably for settlement of a wage scale and working conditions this spring, it has no intention of injecting itself into these negotiations at this time, it was stated at the White House Friday.

The White House spokesman said that while the administration anxiously hopes that a way will be found to bring about peace in the coal world, it does not consider the time opportune to exert pressure by the national government on the representatives of the bituminous-coal industry and of the workers, who have been conferring at Chicago.

Utilities Representatives Outline Problems To U. S. Coal Commission

Representatives of the public utilities, the central stations, gas companies and the street railways appeared before the U. S. Coal Commission on Jan. 3. The Joint Fuel Committee, representing the National Public Utility Association, of which John W. Lieb of New York is chairman, is composed of M. H. Aylesworth, of the National Electric Light Association; O. S. Fogg, of the American Gas Association; A. P. Lathrop, Lucius S. Storrs, J. W. Welsh and J. P. Jackson. The committee held an informal discussion with the commission throughout the entire day. In a printed brief made public after the meetings were over the public utilities set forward their position and function in the welfare of the country and urged that nothing be done to prevent the expansion of the utilities. After pointing out the large economies in the use of coal made possible by large-scale operations, especially in the central power stations, the brief points out:

"(1) Necessity for absolute continuity of operation to prevent public catastrophe and interruption of industrial production.

"(2) The difficulty experienced in obtaining dependable and adequate contract coal supplies in times of railroad or mining emergencies.

"(3) The difficulty, by reason of the unresponsiveness of governmental or commission control of rates, of paying the prices required to buy 'spot coal' in times of emergency.

"(4) Difficulty in obtaining the grades of fuel best adapted to the uses for which they are required.

"(5) The increased cost of utility operation and danger of suspension of service where it becomes necessary to use improper grades of fuel."

The occasional "serious and extraordinary financial burdens" placed on the utilities and passed on to the public through high-priced coal, especially in 1922, was discussed at length. It is pointed out, for instance, that last autumn manufacturers could get coal and utilities could not. The brief continues with a résumé of the difficulties experienced by the utilities in recent years, "particularly in 1919 and 1920 and during the spring and summer of 1922," in obtaining supplies of coal from their contractors; of the high prices they were obliged to pay for spot coal, of their experience with priorities and of their difficulties with poor qualities of coal.

The following extract appears in the brief under the caption—"Contracts fail to secure adequate coal supply":

"The difficulties the utilities have had is largely due to the fact that, when there is shortage of coal or of coal cars, the supply they receive on their contracts is prorated proportionately with the other customers of the mines. If the mine is contracted for to its normal capacity, and it finds itself able to supply but a portion of its output, the utilities under contract with it suffer with other contract customers.

"A typical illustration of the result of this condition is that of a Middle West medium-sized electric-power company, which during two weeks in October, was only able to obtain 2,000 tons, or 16 per cent, needed coal upon its term contracts during the fall of 1922. It was therefore compelled to buy 'spot coal' to the amount of 10,000 tons, which made up the deficit. Not only was this company under necessity of appealing to the Joint Fuel Committee to aid in relieving it from the imminent danger of shutting down, but it was compelled to pay an excess of $27,000 for its coal, obtained during the two weeks, over the amount which would have been necessary had it received its full supply on its contracts.

"To provide for deficit of coal on contracts in 1920, one large power company was compelled to bid for spot coal at such rates that it paid out over $900,000 beyond the amount which would have been necessary had it received one hundred per cent on its contracts, and paid for a similar purpose nearly $300,000 in 1922. Bituminous coal was purchased by a utility in 1920 at over $16 per ton delivered at a plant in New York. This was much higher than the average prices paid, but indicates the serious straits of the utilities in times of emergency when their contracts are not to be depended upon.

"In the case of a Southern power company an actual reduction of power to the extent of 15,000 k.w. occurred in 1922, because it was unable to get sufficient coal at any price though it had contracts for approximately ten times the coal needed. This caused serious trouble over a wide territory, crippling industrial production and contributing to labor unemployment.

"Another large utility which had contracts for 45,000 tons of coal for August, 1922, received 1,125 tons, and in November received only 42 per cent of contract amounts. The result was a continual lessening of its reserve even though it has bought 'spot' and foreign coal at high prices.

"Even the purchase of mines by the utilities does not always relieve them of much of the difficulty suffered by those who contract for their coal. Thus, a large and important Ohio valley utility reported on Dec. 5, 1922, that, of the 11.2 cars per day needed to equal the rating of its mine —in accord with the rules of the Interstate Commerce Commission—it was supplied with an average of only 2.8 cars per day in November.

"These examples can be multiplied by innumerable others."

Commission Issues Further Instructions on Form L-1, Covering Labor Earnings

The U. S. Coal Commission last week issued further instructions (B) relating to Form L-1, which covers earnings of labor, as follows:

"Referring to the original 'Instructions for filling out details on Form L-1,' the first three paragraphs of these instructions are modified as follows: Any company that so desires may leave blank the lines following: (1), (2), (3), (4) and (5) on the Form L-1, and transmit to the commission along with this form the information requested on lines (1), (2), (3), (4) and (5) *on a separate sheet.* The actual sheet will then be identified by code marks in the offices of the commission and the information given under these numbers will be held confidential.

"Under (2) in the original instructions for filling out details in Form L-1, the instructions directed, in the case of tonnage workers, to give on the line 'D/H' the number of days the tonnage workers were at work in the mine in that pay period. As indicated in the letter of Dec. 18, answering questions relating to Form L-1, this does not mean the number of full days that a tonnage man worked during a pay period, as it is fully understood that the number of full days cannot be ascertained. The word 'day,' in so far as it relates to tonnage workers, is to be understood as meaning 'starts.' In other words, enter on the line marked 'D' the number of days on which such workers actually started work; and this is to be determined, as already stated, by crediting a tonnage worker with a start for each day that a car of coal comes out with his check mark on it. Again, as has been already stated, it is clearly understood that this will in many cases give credit for a start where no actual start was made; but this will be explained in the report.

"The point that it is intended to make clear in the foregoing paragraph is that with tonnage workers the days given under the various payroll periods represent starts and the total days given in column 49 for such workers also represents starts and is not understood or intended to be full working days."

Chicago Conference Fails, So Next Move Is Parley Of Central Field in New York Jan. 17

The Chicago conference of miners and operators, Jan. 3-5, failed to agree upon any method of future negotiation in the coal industry. In three days of struggle on the part of various operator factions to put across their various programs and in three days of absolute refusal on the part of the miners to agree to anything less than four-state negotiation, only one concrete result was produced. That was a tacit agreement that another conference will be held in New York City between Jan. 17 and Jan. 22. It is highly probable this will open as a Central Competitive Field conference, as operators in that field are the only ones to be invited. President Lewis, of the miners, however, declined to admit that the outlying districts were not to be asked in. The invitation is to go out from Mr. Lewis as president of the United Mine Workers, and Phil Penna as an individual. Mr. Penna, who is secretary of the Indiana Bituminous Coal Operators' Association, was chairman of the Chicago conference and is ardently in favor of four-state negotiations.

What may happen after the New York conference convenes and what sort of negotiations may proceed are indeed problematical. It is not certain that the operators and miners will agree upon a continuance of the present wages and conditions for another year, as the U. S. Coal Commission, through Chairman Hammond, openly suggested to the Chicago conference on its second day. However, if anything can be said to be likely in so tangled a situation as present-day labor relations in the coal industry, the one-year plan is likely.

There is little doubt that Illinois, Indiana and northeastern Ohio will hasten at once to the New York conference. Southern Ohio is not so willing. Western Pennsylvania, the other unit in the Central Competitive Field, balks unless the four-state plan is officially and openly advocated by the U. S. Coal Commission, in spite of the operators' fear that a contract made on that basis will be just as illegal now in the eyes of the federal courts as it was when 225 participants in the last four-state pact were indicted.

Union Spurns District and State Plans

The Chicago conference, following two futile efforts of a subcommittee to agree upon a plan for future negotiations, convened the morning of Jan. 3. It received the failure report of the subcommittee, read the first of the John Hays Hammond telegrams to the conference—a message urging an agreement to prevent a strike lest the commission be faced with "the necessity of fixing the blame for failure to adjust your difference"—and then devoted a short time to oratory on both sides. In that first short joint conference the miners, in a speech by Secretary William Green, made it plain the union would agree to no district or state plan and would accept nothing short of a contract made with a group of operators at least as large as the old Central Competitive Field.

With no progress made, the conference decided it would try a small joint committee of five men from each side plus President Lewis for the miners and Mr. Penna for the operators. The other operator members were Rice Miller, Illinois; Charles O'Neill, central Pennsylvania; James W. Needham, Montana; Hugh Shirkey, Indiana, and Harry Taylor, Kansas; the other miner members were William Green, Indiana; John Ghizzoni, central Pennsylvania; Frank Farrington, Illinois; Lee Hall, Ohio, and Arch Helm, Missouri. This committee failed to agree upon anything.

That night an operators' committee tried to compose operators' differences sufficiently to enable them to make a proposal to the miners. The proposal, which was rejected the next day, was for district negotiations and was practically the same as the last one the operators suggested in the Chicago conference with the miners of the "two-by-two committee" a month before, except that it did not provide arbitration, so hateful to the union, nor any system of flexible wage scales. The committee which worked this futile plan out was: Charles O'Neill, central Pennsylvania; W. L. A. Johnson, Kansas City; T. K. Maher, Ohio; C. H. Jenkins, West Virginia; M. L. Gould, Indiana, and John Donaldson, Pittsburgh. This committee's proposal was:

> That each of the United Mine Workers districts jointly represented in this conference be constituted a wage-scale-making body with full right of autonomy to negotiate wage-scale agreements based upon competitive conditions found existing and affecting each such district, and further, each such district shall be vested with the right to join with any other district or districts, as may be mutually satisfactory to the mine workers and the operators of the district or districts affected, for the purpose of negotiating wage agreements for such section.
>
> For the purpose of negotiating wage-scale agreements to be effective upon the expiration of the present wage agreement, April 1, 1923, the following named districts: No. 2, central Pennsylvania; No. 5, western Pennsylvania; No. 6, Ohio; No. 10, Washington; No. 11, Indiana; No. 12, Illinois; No. 13, Iowa; No. 14, Kansas; No. 17, West Virginia; No. 21, Oklahoma, Arkansas and Texas; No. 22, Wyoming; No. 23, western Kentucky; No. 24, Michigan; No. 25, Missouri, and No. 27, Montana, shall exercise their inherent right under this resolution and by mutual agreement between the mine workers and operators of each of the districts or sections hereinbefore mentioned, shall meet in joint conference at such place as the operators and miners of each district or section may agree; such meetings shall convene in all districts not later than Jan. 22, 1923, for the purpose of negotiating wage scale agreements.
>
> The section of any wage scale making a district or section agreement shall be binding only on that district or section and shall not be binding or have any effect whatsoever upon the making of a wage-scale agreement in any other district or section.

On the second day of the conference there came the second telegram from John Hays Hammond, chairman of the U. S. Coal Commission. This was addressed to Phil Penna, of the operators, and William Green, of the miners, and was the commission's first open proposal that the present contract be continued for another year. The message had an effect upon the conference but led to no agreement, even though a strong effort was made the next day to have the suggestion carried out. The telegram and the replies of Penna and Green are printed in full on another page.

Joint Committee Considers Hammond Telegram

Upon the refusal of the miners to entertain the proposal of the operators for district negotiations, the joint conference appointed another joint committee to reconsider the plan and to consider the Hammond telegram. This joint committee also failed to agree. On it were Phil Penna, Indiana; Herman Perry, Illinois; Michael Gallagher, Ohio; Charles O'Neill, Pennsylvania; James W. Needham, Montana, and J. B. Wilson, Oklahoma, representing the operators, and William Green, Indiana; John Brophy, Pennsylvania; Frank Farrington, Illinois; Lee Hall, Ohio; Arch Helm, Missouri, and President John Lewis, for the miners.

On the morning of the third day the conference resumed at a point no more advanced than that of the first day. A strong effort was being made, however, by such men as T. K. Maher, a leader in signing with the union to break the last strike, and by outlying district leaders such as Harry Taylor and C. H. Jenkins to stave off the studied drive of Illinois, Indiana and northeastern Ohio for four-state negotiation, and instead, to obtain national acceptance of the commission's proposal that the present contract be allowed to run another year.

Chairman Penna twice ruled motions looking toward immediate settlement as out of order. Each time his ruling was appealed and each time sustained, the miners not voting. Each time Mr. Penna yielded the gavel to J. W. Needham and took the floor in defence of his ruling. One of the rejected motions was by Mr. Taylor, favoring district agreements to continue the present wage scale a year. The other was by Mr. Maher, to adjourn the conference forthwith and immediately to reconvene it as a scale-making body to sign an agreement for a year, as the commission had urged.

By the noon adjournment it was obvious that the operators favoring four-state negotiations and an adjournment of the conference were in control and that nothing else could be done. Therefore early in the afternoon session adjournment was taken. No official announcement was made

of the proposed New York conference Jan. 17 but a message was wired to the U. S. Coal Commission prophesying that such a conference would be held. The message explained to the commission that no agreement was possible at Chicago because of the "diversity of opinion and the divergence of interests" among operators.

So the joint conference broke up with the outlying district operators complaining that "Phil Penna packed every committee" and therefore it was impossible to get any plan reported that might produce an agreement and thereby interfere with Midwestern hopes for four-state negotiations.

Herrin Defence Alleges That Massacre Was Committed by "Strangers"

Beginning Jan. 2 the defence of the five prisoners now on trial at Marion, Ill., for playing leading parts in the Herrin massacre of June 22, was raised by the testimony of about 50 witnesses in Judge D. T. Hartwell's court. About 30 more are to be heard, after which the defence lawyers—attorneys for the United Mine Workers—say their whole case will be in. During last week most of the 50 witnesses declared they saw the "death march" of the Herrin mob with its non-union prisoners and that not one of the five men on trial in this first case was to be seen. The state's witnesses, testifying before Christmas, positively identified them all as leaders of the mob.

During the past week there was considerable testimony as to the rough conduct of mine guards who served the Lester strip pit before the mob besieged it. Only one witness could testify that he had been attacked by guards, however, and he was "shoved in the side." Also it was testified by several witnesses that the mine guards fired into a group of union miners who tried to approach the mine to talk peace before the pit siege started June 21.

L. & N. Improvements Start New Projects In Eastern Kentucky Coal Fields

The $52,000,000 improvements which the Louisville & Nashville R.R. has started to make in its Kentucky lines and the betterments which other railroads have promised have already nurtured a crop of new coal-mining projects which are expected to lead the way for much additional development of the eastern Kentucky coal fields.

Several interesting deals have been reported during the past few days. An announcement comes from Whitesburg, Ky., that Sam Collins, state prohibition director, Lexington, Ky., and Louis E. Harvie, of Whitesburg, Ky., have purchased $40,000 of coal land on the L. & N., near Whitesburg, and plan a new town and development of coal properties.

K. U. Meguire, of the Harlan Coal Co., Louisville, one of the active young developers of eastern Kentucky, who has developed some big mining interests, recently went into the Hazard field and obtained control of the Gorman-Purciful Coal Co., which will become the Black Raven Coal Mining Co.; capital $25,000 at the start. This company will have only a small operation, now about six cars capacity, which will be increased to ten or twelve cars a day, by installation of modern equipment. Mr. Meguire has some other development projects in hand.

It is reported that the L. & N. will soon start an extension from Vico, on Carr's Fork, twelve miles into undeveloped coal property in Letcher County. The Fame-Elkhorn Coal Co. has announced plans for immediate development of property recently leased on Sandlick Creek, near Whitesburg, where a lot of lease taking has been going on of late. Development was expected to start after Jan. 1. The Fame-Elkhorn people will construct a new town and a modern plant. It is reported that the Sandlick branch of the L. & N. will be extended to the new leases.

Down in the Harlan field there are several projects pending development of the L. & N. extensions, especially if a plan for looping into the field and back, instead of double tracking, is carried out, as the north-bound loop would open a lot of new territory.

Coal Company to Sue for $1,000,000 Damages in Herrin Massacre

A suit for $1,000,000 against the United Mine Workers of America is being prepared by attorneys for the Southern Illinois Coal Co. as a result of the Herrin riots of last June.

The suit will be filed in the federal courts on the basis of evidence gathered by federal investigators of interference with interstate shipments of coal from the mine. The papers will be ready for filing within a few days, according to O. A. Olson of Bull, Lytton & Olson, attorneys for the company.

Coal Consumption by Public Utilities Increased in November

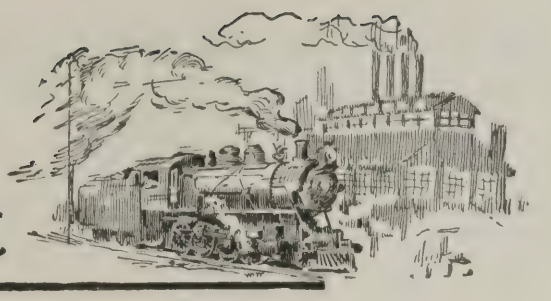
Electric public-utility plants consumed 3,329,948 net tons of coal during November, according to a recent report of the Geological Survey. This compares with 3,277,357 tons in October.

The average daily production of electricity by public-utility power plants in November, as predicted, broke all records of output, making the fifth time that a record has been established since May. The daily production of electricity in November was 146,600,000 kw.-hr.—nearly 5 per cent greater than the October record. The total output for the period January to November, inclusive, was 43,089,000,000 kw.-hr., an increase of more than 16 per cent over the same period for 1921.

Hammond Does Not Aspire to Succeed Fall

John Hays Hammond chairman of the U. S. Coal Commission, has been mentioned prominently in connection with the appointment of a successor to Albert Fall as Secretary of the Interior. Mr. Hammond told this correspondent, however, that the place has not been offered him and that he is not an aspirant for the office. He stated that he had undertaken the work with the Coal Commission and wants to keep his shoulder to that wheel until the task is completed. It is known that Secretary of Commerce Hoover regretfully declined the portfolio of the Interior.

As this is written, Representative Mondell, of Wyoming, seems most likely to obtain the appointment. It may be said, however, that the President makes his own appointments and it is doubtful if anyone, other than he, knows to whom the job is likely to go.



STATE INSPECTOR ADVOCATES SCHOOL OF MINES. — The establishment of a school of mines in West Virginia is advocated by R. M. Lambie, chief of the state department of mines of West Virginia, in a letter addressed to coal operators in various sections of the state. Governor E. F. Morgan also in a recent public address advocated the establishment of such a school. Though West Virginia is the second largest coal producer in the United States it has no school of mines and only one institution offering a course in mining and that only a brief one. "West Virginia," says Mr. Lambie in his letter, "has at present 800 men attending evening mining classes, a larger number than any other coal-mining state."

HARRY W. LITTLE, of Evansville, Ind., has gone to Washington to become secretary to the special committee of bituminous operators that is co-operating with the U. S. Coal Commission. J. C. Brydon is chairman of the committee. Mr. Little has grown up in the coal business. His father was an operator in the Indiana field. He has been secretary of the Southern Indiana Coal Trade Bureau since its formation. He was educated at Wabash college and Johns Hopkins University.

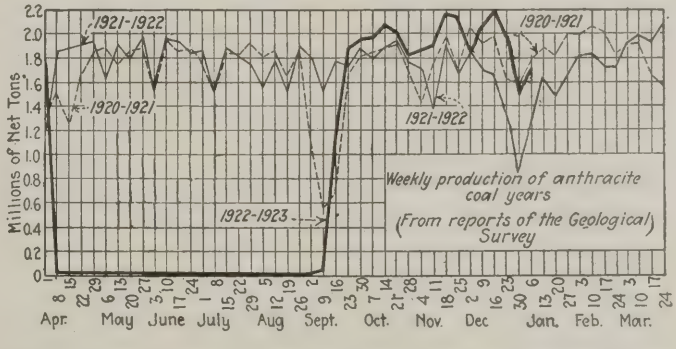
THE CONFERENCE OF CAR-DISTRIBUTION RULES between representatives of the National Coal Association and the American Railway Association will be held in Washington Jan. 11.

Production and the Market

Weekly Review

Heavier production followed the holiday idleness but the accumulation of empties was quickly absorbed when full-time work was renewed, and the car shortage is now as acute as it was before Christmas. Railroads made the most of the lull in loading and cleared away much of the congestion that has been slowing down the freight movement lately. Declining prices resulted from the heavier output but the drop was only temporary, and as the car supply tightened, spot quotations rallied and moved upward again. *Coal Age* Index of spot bituminous coal prices rose 6 points during the week to 375 on Jan. 8, with a corresponding average price at the mines of $4.54. The previous week this figure was $4.47.

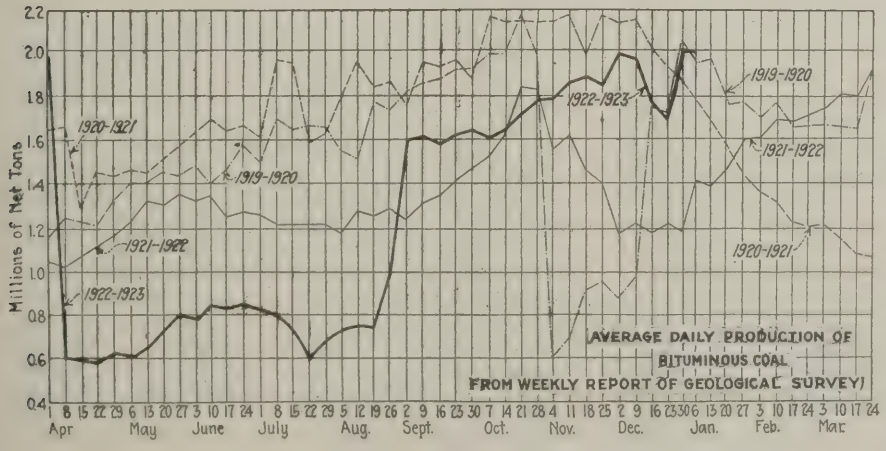
Quotations Fluctuate with Car Supply



The daily rise and fall of quotations in accordance with the car supply shows how sensitive the spot market has become. Railroads, utilities and large users are drawing heavily on current output and the volume of spot offerings is meager. Smaller industries are buying on a day-to-day basis and the tendency to stock coal grows with the realization that the slender margin between supply and demand is endangered by inclement weather and its effect on transportation.

The steam market is spotty, nevertheless. In the Middle West mild weather and a better car supply conspire to lower prices a trifle and big consumers were quick to take advantage of the slump. The same conditions obtain, but to a lesser degree, in the Cincinnati territory. Inclement weather has held the market firm from Pittsburgh east on all steam coals. New England manufacturers, apparently seeing a better trade outlook, have awakened to the fuel situation and better buying has resulted. Hampton Roads prices are firming up with the stronger Eastern call.

The domestic market shows no signs of abating. Screened grades are moving eastward over an ever-widening territory to offset the anthracite shortage. In the normal markets for domestic soft coal there is a steady distribution by retailers and replenishments are promptly placed on order. Ohio reports a dearth of smokeless and other West Virginia grades and home-mined coal is moving well in that state as a substitute domestic fuel.



Uncertainty over the labor situation has not reached a point where it is a market factor. Consumers are apprehensive about the outlook on April 1, but are not inclined to stock any additional tonnage at such an early date.

Storms and cold weather have added to the troubles of the anthracite distributors. The drop in production over the holidays is being felt in lowered receipts. Do-

mestic sizes move out as fast as they are received and yard stocks are comprised mainly of buckwheat, bituminous coal and coke.

The Pennsylvania Fuel Commission has issued a fair-price list for all producers whose domestic schedules exceed $9.25, showing a high figure of $12. Canadian

Estimates of Production

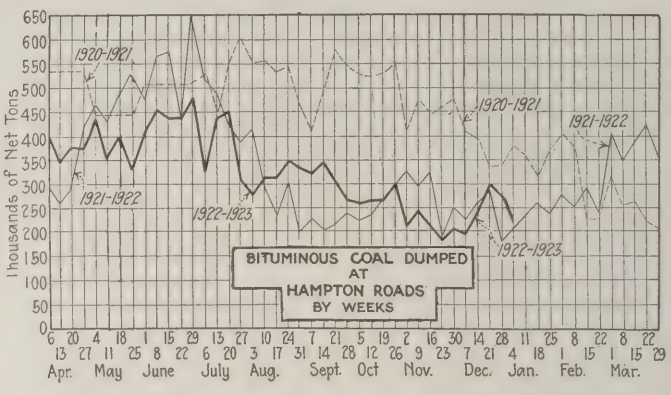
(*a*) Subject to revision. (*b*) Revised from last report.



buyers, however, are actively seeking tonnage for which they are willing to pay a premium and in some cases, it is understood, cashiers' checks are offered in payment for the coal before it has been loaded.

Demand for coke as an anthracite substitute has abated somewhat. Heavy orders have been filled and producers and shippers are going slow until they can determine how it is going to be received by householders. This has lowered coke quotations 50c.@$1 from their level of last week.

BITUMINOUS

"Revised estimates for the last week of 1922 (Dec. 25-30) show a total output of 9,974,000 net tons of soft coal," says the report of the Geological Survey. "On Christmas Day production ceased. Recovery thereafter was prompt and a high rate of output was maintained, the average for the five working days of the week being 1,995,000 tons. The improvement shown in comparison with the two preceding weeks was largely due to the opportunity which the holiday afforded the carriers for relieving traffic difficulties.

"Preliminary reports of cars loaded during the first four days of last week (Jan. 1-6) indicate that production on New Year's Day was equal to nearly 30 per cent of the output on recent Mondays. The production on Tuesday was large and the average daily rate of output for the full week

apparently will be about the same as in the week before. Thus the output in the first week of 1923 is expected to be about 10,500,000 net tons.

"Summation of the weekly estimates of soft-coal production in 1922, based on reports of car loadings, shows a total

* Net tons, f.o.b. mines. † Advances over previous week shown in **heavy type**, declines in *italics*.

for the year of 407,712,000 net tons. This figure nearly equals the preliminary estimate made on the same basis for the year 1921, and it is expected that final returns from the mines for 1922 will show that the total output for the year will approximate that of the year before.

ESTIMATED UNITED STATES PRODUCTION OF BITUMINOUS COAL
(In Net Tons)

	Production	Average Per Working Day
Annual production:		
1918 (Calendar year)	579,386,000	1,880,000
1919 (Calendar year)	465,860,000	1,515,000
1920 (Calendar year)	568,667,000	1,846,000
1921 (Calendar year)	415,922,000	1,350,000
1922 (Calendar year)	407,712,000	1,330,000

"The following table compares the 1922 production of both anthracite and bituminous coal with the output in the eleven years preceding. The figures are expressed in million net tons.

PRODUCTION OF ALL COAL, 1911-1922

	Anthracite	Bituminous	All Coal
1911	90	406	496
1912	84	450	534
1913	92	478	570
1914	91	423	514
1915	89	443	532
1916	88	503	591
1917	100*a*	552	652
1918	99*a*	579	678
1919	88	466 (strike)	554
1920	90	569	659
1921	90	416	506
1922	52 (strike)	408 (strike)	460

(*a*) Years of large washery production.

"The all-rail movement of coal to eastern New York and New England, although large for the season, was smaller in the week ended Dec. 30 than the two weeks preceding. According to the American Railway Association, 2,696 cars of bituminous coal and 3,166 of anthracite were forwarded through the Hudson gateways and 71 cars of soft coal and 18 of anthracite were shipped through Rouses Point."

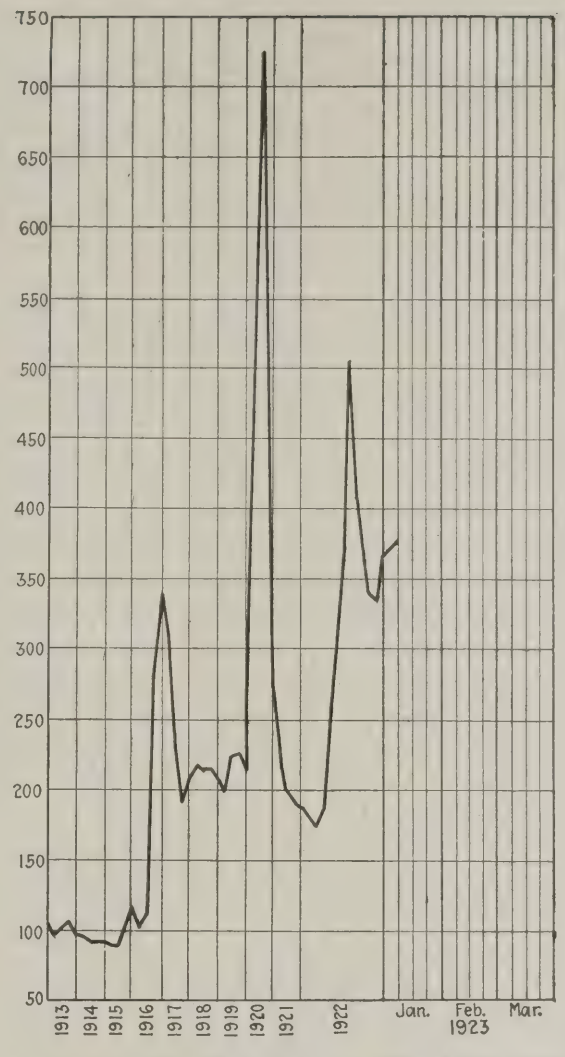
The Lake movement of cargo coal for the 1922 season is reported as 18,522,000 net tons. In 1921 the movement was 22,413,000 tons, and 22,408,000 tons went forward in 1920. Heavy shipments from the Head-of-the-Lakes docks have reduced the supply of free coal to about 700,000 tons, but confidence in the all-rail supply has reassured Northwest consumers of soft coal.

Hampton Roads dumpings were 231,386 net tons during the week ended Jan. 4, as compared with 277,312 tons in the preceding week. More coal is flowing to Tidewater, however, as activity in the East enables shippers to offer prices that compete with going quotations in the West.

ANTHRACITE

Anthracite production declined sharply during Christmas week, when 1,541,000 net tons was mined as compared with 2,028,000 tons in the preceding week. Preliminary reports for New Year's week indicate an output of approximately 1,700,000 tons. The total output for 1922 is estimated at 52,465,000 tons. The decrease of 38,009,000 tons, or 42 per cent, as compared with 1921, is, of course, attributed to the 23-week's strike.

COKE



Production of beehive coke also declined during the week ended Dec. 30. The output was 260,000 net tons, as compared with 281,000 tons in the previous week. The year's output is placed at 8,030,000 tons, as compared with 5,538,000 tons in 1921.

The recession of domestic demand has softened the Connellsville market. Blast furnaces are taking light tonnages as it seems they had quietly covered for the first quarter, although the price bulge caused by the December domestic demand interfered with contracting programs and revised first-quarter figures upward 50c.@$1.

Coal Age Index 375, Week of Jan. 8, 1923. Average spot price for same period, $4.54. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913-1918," published by the Geological Survey and the War Industries Board.

Foreign Market And Export News

British Market Feels Stimulus of Renewed American Demand and Italian Inquiries

British production continues at a high rate. The output during the week ended Dec. 23, was 5,506,000 gross tons, according to a cable to *Coal Age*, as compared with 5,742,000 tons in the preceding week, which was the record for the year.

Stormy weather has greatly delayed coal loading at the ports. More than 100,000 tons was booked for this month for the United States, and the movement for January, February and March may reach the 500,000-ton mark. The renewal of this movement is a result of the continued shortage and fears of a cold weather tie-up of the domestic supply.

In order to pay the minimum wage above the standard, November accounts in South Wales show that owners must sacrifice £191,000 of standard profits making this total for the twelve months £3,057,000.

Welsh pits are booked up in almost every case until the middle of January and in many instances, into February. There is no slackening in the general volume of demand and the market has again been stimulated by new American demands and large contract inquiries from Italy, the latter reputed to be in the vicinity of 500,000 tons, for delivery over the new year. A considerable amount of contract business has been concluded, which in itself must contribute by its volume to a strong market for some time to come. Prices in South Wales show a tendency to rise. Further inquiries on contract account have come in from various directions.

Coal shipments from Durham and Northumberland have developed at an amazing rate. The output has advanced by leaps and bounds, while less men have been employed.

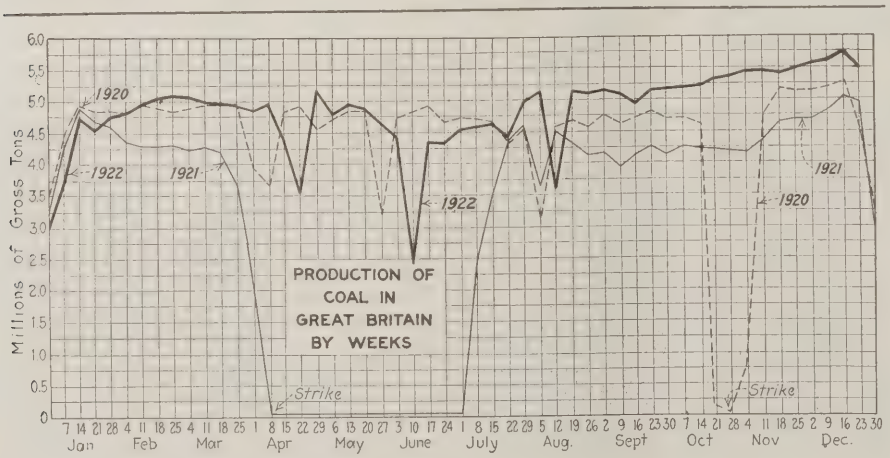
Recent operations on the Newcastle coal market suggest that the first quarter of the year will be very active. Inquiries are heavy for January and February from all sources, including Russia. The demand for gas coal is particularly good, and coking coals come next in popularity. In general the inquiry is strongest for the superior brands of all classes.

In the coal tonnage chartering market there is little activity, as it is almost impossible to secure any guarantee of early loading. The ability to secure a loading turn has been the determining factor in rates for many weeks, and the congestion is restricting business. The partial adoption of a three-shift system by working it at the two most congested loading points is being watched with interest, and it seems fairly certain that an extension of the principle must be carried out if business is to proceed.

During November, 1,617,587 tons of coal were shipped for use of steamers engaged in the foreign trade, as compared with 1,322,287 tons in November, 1921, and 868,594 tons in November, 1920. During the first eleven months of the year 16,805,550 tons were so shipped, as compared with 9,646,136 tons, and 12,638,263 tons, in the corresponding periods of 1921 and 1920 respectively.

Heavy Imports of British Coals Ease French Market; German's Coal Statements Denounced

The situation remains satisfactory for industrial and excellent for domestic coals and patent fuel. The demand, however, owing to an increase of British coal imports (from 886,000 tons in September to 999,000 tons in October and 1,204,000 tons in November) and also to some increase in the French coal output, is not quite so feverish.



The collieries of the Nord and Pas-de-Calais have just published their new price schedule, to be applied as from Jan. 1. These prices are the same as those of July 1, 1922, except as regards patent fuel. However, these prices are generally exceeded by collieries for their outside sales.

The Société des Cokes de Hauts-Fourneaux, which is the agency distributing metallurgical coke to French blast-furnaces, has raised the adjusted price of coke at the Franco-German frontier to 110 fr., effective Feb. 1.

This is a consequence of the gradual reduction of German coke deliveries (averaging 11,300 tons per day for the first fourteen days of December, as against a daily minimum requirement of 15,000 tons) and also of diminished supplies from Belgium, the price of which has been increased to 120 fr. Owing to the slowness in the recuperation of the French coke production, the Société des Cokes de Hauts-Fourneaux had no other recourse but to apply to Great Britain for supplemental deliveries of coke—100,000 tons—at a price unfortunately which increases considerably the average price to be paid by French blast-furnaces.

So frequent have been recent reports in the German press stating that if Germany was obligated to import considerable tonnages of British coals, to the detriment of her finances, the fault lay in the deliveries of reparation coals imposed upon her by the Versailles Treaty, that it is necessary to dispel with plain facts this fallacious statement. On the basis of statistical data available for the first ten months of 1922, it is reckoned that France's coal consumption, within her new frontiers, will be, in 1922, equivalent to only 77 per cent of what it was (Alsace-Lorraine included) in 1913. But, notwithstanding this reduction in her consumption, France has imported about 12,000,000 tons of British coals (10,826,000 tons during the first eleven months), while she imported only 11,000,000 tons of these coals in 1913.

On the other hand, Germany is now proportonately better self-supplied with coals than the other countries of Western Europe, and most of the British coals she imports are probably used for the making of exported products. Therefore, if Germany has to pay higher prices for imported British coals than for her own coals, she is recovering that difference by selling manufactured goods at world's prices on export markets, and she has, besides, the advantage over other countries—all using British coals or coals equivalent in price—of cheaper labor and of cheaper handling and transportation costs. Moreover, Germany is availing herself of such successive increase in miners' wages by raising coal prices and thus gradually bringing them nearer to the world level. The London *Times* even declared, in one of its last issues, that, in present altered circumstances, imported British coal was more advantageous to consumers of the coasting area of Northern Germany than German coal itself.

GERMAN REPARATION DELIVERIES OF COAL IN NOVEMBER

	To France	To Luxenburg
	Tons	
Coal	332,901	3,068
Coke	367,753	125,223
Lignite briquettes	52,499	5,060

The French coal owners have not yet defined their attitude with regard to the claim for a wage increase recently formulated by French miners. However, as any increase in the wage rates would mean a corresponding increase of the selling prices, fears are freely expressed lest the competitive power of French coal mines should thereby be affected, all the more so as there is not much chance of the miners' work time being legally extended in accord-

ance with the owners' desires, although these desires were endorsed, last October, by the Mines Commission of the Chambre des Députés.

Germany Seeks More British Coal

In December Germany had her first experience with deflation with a rather significant effect upon the industrial, especially the coal situation. The mark rate improved, all in all by nearly 30 per cent. Prices, however, especially those comprising cost of living, have continued their upward flight. The only instances of a decrease of prices are those of pig iron, which are keyed to the rate of exchange, and of rolled products. Coal prices on Dec. 1 were adjusted at a ratio to their pre-war level, corresponding with a rate of the mark to parity of 1,900. The recent lowering of this rate put coal prices above pre-war level, in fact to nearly 15 gold marks per ton compared with 12 gold marks in 1913.

The margin between the price of German and British coal, c.i.f. Hamburg, has almost disappeared. The increase of freightage, coming into force on Jan. 1, will even cause a margin in favor of British coal, as long as the present rate of exchange prevails.

In spite of such conditions, the miners have again raised claims for a considerable increase of wages on the ground of the still rising cost of living. Upon their request the overtime shifts in the Ruhr district, which have had such favorable effect upon production, have been stopped from Dec. 18 to Jan. 15 for the alleged reason to grant the miners a relaxation, but manifestly for the purpose to put force into their new claims.

Coal imports have lately shown a decline. The import of British coal in November was still above the pre-war average, but is nearly 100,000 tons less than the preceding month. On the strength of the small margin left between German and British prices, the impending increase of freights already mentioned, and the drop in the rate of production expected from the stoppage of the overtime shifts, large contracts have recently again been placed by importers of British coal.

November production in the Ruhr district was 8,596,214 tons of bituminous coal, 2,176,850 tons of coke and 376,438 tons of briquets. The average daily output in November reached the highest figure recorded since pre-war times. The production of bituminous coal in German Upper Silesia was 776,626 tons or 32,359 tons per day, of which 387,269 tons were shipped to the interior of Germany.

More Stability at Hampton Roads

Business shows signs of improvement, with heavier demand and an increase in supplies at tide. The tone of the market is decidedly healthier than at any time for several weeks.

Coastwise movement took a boom last week, while the bunker trade held up well. There was no foreign business, the higher prices having placed that further from the range of possibility. Some improvement in the car situation was felt.

North Atlantic

Prices Rally as Shortage Of Cars Quickly Reappears

Accumulation of Empties Over Holidays, Accompanied by Price Drop, Is of Short Duration—Loads Move Slowly —Good Grades Scarce.

After a temporary betterment, due to the accumulation over the holidays, the car supply has again fallen off and empties are as scarce as they were before Christmas. Prices dropped with the heavier loadings but rallied quickly with the renewed car shortage. Movement of loads is slow and good grades are hard to obtain. A feeling of hesitancy has slowed the demand somewhat, although the market could easily absorb a much larger tonnage than is offering.

The domestic market is very active. Good screened coals are well sold up and the shortage is responsible for higher prices.

CENTRAL PENNSYLVANIA

Prices along the Pennsylvania range as follows: Pool 10, $4.50@$5.25; Pool 11, $4.50@$4.75; Pool 9, $5.50@$6.25; Pool 71, $6.50@$7.50. On the New York Central, Pool 11 is $4.50; Pool 10, $4.75 @$5.25; Pool 71, $6.50@$7.

There was a fair distribution of cars on the day following New Years, amounting to 30 per cent of the Pennsylvania's Cresson division but later in the week it dropped to 15 per cent. On the New York Central a 100 per cent distribution at the beginning of the week dropped to 50 per cent later.

NEW YORK

Demand was not so strong last week and prices declined slightly. Buyers were about but simply asking questions.

Poor car supply did not appear to cause any increase in buying although many mines did not work more than half time. Reports as of Jan. 5 showed 3,170 cars at the local terminals as against 2,679 cars on Dec. 29. However, most of this was Pool 11. There was nothing better than Pool 10 coal for the spot buyer and very little of that. Most of the coal was on order.

British coal is arriving here in increasing tonnage. Two cargoes reached port early last week, one consigned to a large railroad. Large tonnages have been contracted for delivery during this and next month. Quotations at the end of the last week for Admiralty coal ranged $8.50@$9 c.i.f., but as freight rates were gradually increasing it was predicted that coal quotations would also advance.

An embargo against shipments of all kinds of freight including bituminous coal, from its connections, was placed by the New York, New Haven & Hartford Railroad Co. late in the week.

Coke and screened coal are in heavy demand. The latter is sold up in most quarters. High-volatile coals were quoted $4@$5, according to grade; gas coals, $3.50@$3.75, and coke, $9@$9.50, all f.o.b. mine. Pier quotations on high-volatile coals ranged $7.75@$8.25.

PHILADELPHIA

Spot coal continues difficult to get, and movement is somewhat slow even after being loaded, and all of this is in the face of unimpeded rail conditions. Most shippers now are spending their greatest efforts in getting old orders off the books and the coal to destination. Operators on railroad fuel are mostly able to make full time, which is quite satisfactory, although prices are under the market. Concerns who have contracts, particularly the large users, report fairly good shipments on their account, but of course not up to requirements, and all of them, without exception, are using a fair amount of stock tonnage.

The demand, of course, continues strong, but in some ways considerable of the edge seems to be worn off, consumers probably having gotten over their first flurry of excitement.

Some of the less desirable coals have only been slightly affected as to price recently. It should be borne in mind, however, that while high prices are quoted for market coals, there is actually only a minimum of the production selling at these prices, by far the greater proportion going on contracts and orders entered long ago at price of $3.75@$4.25, and much rail fuel at less than this.

UPPER POTOMAC

There was a decline in production during the final week of 1922, due in large measure to the holiday vacation of miners. Otherwise it is probable that production would have been on a larger scale than usual. The most noticeable improvement is observed in the Georges Creek region. Producers are besieged with inquiries.

BALTIMORE

Immediately after the holiday period the railroads were able to deliver a much better supply of cars to the mines. A price drop of about 50c. came during the past week. At this writing, however, the car supply has gone back almost to the conditions existing just before the holidays and the range of prices has returned to the former high level.

An incident of the last week is quite interesting. Certain interests here secured control of a mine with coal unpledged, and efforts were made to get a number of plants to agree to take a certain tonnage in box cars. The inducement was the offer of the coal at about $1 below the average market price. At last accounts it was reported that not much interest was being shown in the endeavor. Of course, Baltimore consumers have not been educated to the use of box cars for fuel delivered, nevertheless, had there been a serious shortage of fuel there is no doubt that the coal would have been taken up as quickly as offered under such a plan.

Revised and complete figures of the imports and exports of Baltimore during 1922 show a decrease of over 1,300,000 tons in the amount of fuel shipped to foreign countries and Porto Rico as compared with the activities of 1921. In the year 1921, however, a large amount of coal went out of this port to take care of loss through the English strike, while in 1922 the shoe was on the other foot. In 1922 35 vessels loaded cargoes totaling 100,708 tons on export. Eleven of these ships took 8,254 tons to Porto Rico, making actual export figures 92,454 tons. Fourteen of the ships with cargo coal took an additional 6,410 tons for bunkers.

FAIRMONT

Although the loss of a day on Christmas tended to curtail production, yet an accumulation of cars over Sunday and Monday made it possible to load an unusually large tonnage when mines did resume. There was a great deal more activity than usual during the holiday period, from a market standpoint. Under this stimulus, which it was not possible to meet, prices hardened somewhat.

South

BIRMINGHAM

Operations are nearing normal activity following the holidays, though labor has not yet returned in full force. Car supply has been better than prior to Christmas, but the more liberal distribution has been due in some measure to the fact that mines were not operating normally, on account of shortage or layoff of labor, and it remains to be seen whether or not there is to be any net improvement in the number of cars available when production reaches the normal stride.

The market is rather quiet for both commercial and domestic fuel, but inquiry is gradually picking up and improved trade requirements are expected. The outlook for a better year in the coal industry is much more promising than it was with the advent of 1922, economic and industrial conditions being on a much more satisfactory basis and there should be a much greater demand for coal during this year.

Pratt.....	2.75@3.00	.....	.....
Corona.....	2.75@3.00	3.00@ 3.75	4.55@ 5.00

VIRGINIA

The Christmas holidays made a difference in the volume of coal mined but brought no diminution of demand. Even before the holiday season proper was ushered in mines began to feel the effect of smaller work crews. Owing to the limited car supply many companies increased the tonnage of coal for coking purposes. At the close of the year there was a strong demand at Tidewater as well as in Inland markets, with prices on a somewhat higher level.

Anthracite

Retail Domestic Stocks Low, Screened Soft Coal Booms

Transportation Difficulties Intensified by Stormy Weather—Supply of Substitute Tonnage Also Falls—Independent Prices Up to $12 on Fair List—Canadian Buyers Offer Premiums.

Stormy weather has added to transportation difficulties. The movement from the mines has been slowed down and retail distribution has reduced yard supplies of domestic sizes to almost nothing. Even substitute tonnage has been lowered and producers of screened grades of soft coal are reaping a harvest. Anthracite steam sizes are moving well, with buckwheat the most active, as it is growing in favor as a substitute for the larger coals.

Independent producers who sold in excess of $9.25 have had their coals scheduled in a fair-price list by the Pennsylvania Fuel Commission. These prices ran up to $12, f.o.b. mines, but it is understood that Canadian buyers are offering attractive premiums for prompt shipment and in some cases are paying cash for the coal before it is loaded.

BOSTON

The outlook here is by no means encouraging. Heavy weather and low temperatures have interrupted shipments and sharpened the demand, and as yet there is little relief in sight. Retail dealers are struggling with the situation as best they can with the means at hand, but each week shows increasing amounts of bituminous and coke distributed to replace anthracite. More than likely it is a factor that will arise to plague the hard-coal operators later on.

At wholesale there is little news. The trade is suffering from light holiday production, and while reports last week were favorable, the tonnage actually coming forward is not enough really to affect the situation. There are those who feel that the local situation is the worst we have experienced since 1902.

NEW YORK

Storms and colder weather added to the troubles of the trade last week. Demand increased correspondingly but dealers were in no way able to meet it. Retail yards are practically clear of the domestic sizes and about the only coal available is bituminous and buckwheat No. 1. The use of substitutes is becoming more general and users are not apt to become so panicky when coal becomes short as heretofore.

The one redeeming feature of the situation was the offering of cargo lots of egg and pea in the local harbor. While the quotations were high the offering was taken to indicate that anthracite was more plentiful, and that the reports from the State Fuel Administration that New York's shortage of coal was being overcome were true.

House owners report considerable success with bituminous and many say they propose continuing its use. In some quarters it is predicted that anthracite operators will find it difficult to regain their entire trade.

Company coals are being widely distributed, and most detail dealers are picking up whatever independent product they can, but are not willing to pay the higher prices quoted, some ranging as high as $15.

A stray cargo of egg was reported as being offered during the past week at $17.50, alongside and a cargo of pea was likewise offered at $14.25, alongside. Washery nut was quoted around $10.50 f.o.b. mine.

Buckwheat No. 1 was the most active of the steam coals. It was quoted at $8.50@$8.75, alongside. Rice and barley were not moving rapidly and only the better grades were bringing company circular.

BUFFALO

The best that can be said is that there is rather more coal on hand than there was, but the improvement is not large and it is not likely to be until spring. The supply of natural gas is good and though it costs 60c. per thousand feet, twice as much as it used to, it has to go. It is better than most of the substitutes are.

Some consumers express themselves as puzzled because they are charged $6 or more for some coal than they are for another, not understanding that the independent premium is about that much. It now sells for about $15 at the mines and then Buffalo pays $3.28 in freight and about $2 for local handling and 50c.@75c. for housing it. Fuel is fuel this winter, unless one learns to use buckwheat at $9 delivered to the curb, then it is easy.

PHILADELPHIA

Demand is tempered considerably by the mild weather. The dealers fully realize that it will only take a drop of 10 degrees to create a frantic rush again. As it is now, retail office forces are being badly shaken up due to the strain of the constant efforts of the consumer to get coal. Another element serving to increase their troubles is the influential customer who could have laid in his entire supply early in the spring, but only took enough to carry over the year end, in anticipation of a price reduction. Numbers of these people are now seeking through various unusual channels to get supplied with additional fuel.

Production has been badly hampered by the holidays and this is now showing in the reduced shipments to the dealers. On the other hand there has been a copious rainfall in the region, which has greatly helped a situation that had become so serious as to cause an occasional shutting down.

Retail prices are higher in a few instances, especially in view of an increase by a large independent shipper to $10.75. As a result of this there are more dealers compelled to ask $16. Buckwheat is $9, although the consumer still balks at taking it. Coke of certain grades is moving well at $13@$17 a ton, dealers getting voluntary orders for it, although the supply is quite limited.

Steam coals have held all their recent gains, and even show some additional strength. The companies are not anxious for additional buckwheat orders, while the independents are able to get premiums of 50c.@$1. Rice is in good demand, and barley shows signs of becoming scarce.

BALTIMORE

Hard coal dealers report that the orders on their books are still far in excess of their ability to deliver and efforts are still being devoted to giving one- and two-ton lots to customers who have run out of coal. A somewhat better run of hard coal to Baltimore is noted, however.

The trade is hopeful that January will show an improvement over December of 1922, when in the neighborhood of 1,350 cars were received. The receipts for October, November and December totaled slightly less than 4,100 cars.

Coke

CONNELLSVILLE

Demand from the East for coke for domestic distribution has practically ceased. The buyers are now receiving heavy shipments against their recent purchases, and it remains to be seen how the coke will be bought by the domestic consumers, also whether it makes a favorable impression. No coke has been pressing on the market but with the decrease in buying furnace coke has eased off about 50c. Furnace coke is now $8.50@$9 and foundry $9@$9.50.

All blast furnaces that had contracts expiring Dec. 31 appear to have covered for first quarter, the price generally being $7@$7.25, though it is possible $7.50 may have been paid in one or two instances. The spot market had declined to $6.50 early in December and furnaces had expected to buy for first quarter at that price or less, but the bulge resulting from Eastern buying for domestic use interfered with the program.

The Courier reports production during the week ended Dec. 30 at 117,300 tons by the furnace ovens, and 75,110 tons by the merchant ovens, a total of 192,410 tons, a decrease of 12,120 tons. The decrease is less than usual for Christmas week. Total production in 1922 was 5,675.000 tons, against 3,572,417 tons in 1921 and 21,654,502 tons in 1916, the record year.

BUFFALO

Coke is hard to get, but it is not quite as scarce as it was. Prices are stiff, considerably above standard anthracite. Jobbers quote foundry at the ovens at $11, furnace at $9@$9.50. The local byproduct ovens are running strong, but they have little or none for the house trade.

Chicago and Midwest

Steam Demand Remains Slow with No Stocking

Uncertainty Over Labor Situation Drives Nobody to Stock Much — Domestic Trade Continues Good and Car Supply Fair in Spots — Eastern Shipments Lag.

The Midwestern market is spotted just now on steam coals. In the southeastern part of the territory the Kentucky and southern Indiana fields are finding industrial demand picking up now that the inventory period is about over and holiday let-downs are past, but around Chicago and St. Louis small sizes move sluggishly. There is no stocking to speak of there. In the latter regions car supply has been ragged, one field getting up to 50 per cent running time and another dropping to little better than one day a week. Steam prices have not improved anywhere but instead, are showing a slight tendency to slip.

Domestic, however, is running strong, except that nobody is trying to buy big lots. The uncertainty about the labor situation is puzzling most everybody though of course this has less disturbing effect on dealers than on big industrials.

ST. LOUIS

A little colder weather has stimulated the market some, but it is usually for the cheaper grades and in small quantities for domestic use. A little high-grade coal is moving in, such as Carterville, and the little anthracite that gets here finds a ready market. Coke is scarce and hard to get.

Country domestic is quiet and usually calls for the cheapest grades of Standard. Locally, steam wagonload is good. Carload is slow, and the same condition covers the country steam, although a fairly good tonnage is moving to the North and Northwest. There have been no changes in prices.

LOUISVILLE

According to local jobbers and producers the gas plants represent the best buyers at the present time, there having been some good tonnage placed, moving toward Detroit, Cleveland and north of the Ohio River. Southern movement has been slack, due to mild weather principally. Utility buying is better and it is claimed that there is some stocking demand developing, now that stocks won't go into 1922 inventory, and in view of the fact that some of the big buyers are fairly well satisfied with steam prices, and figure that they had better play safe and stock some coal, as insurance against any strikes in the spring.

Railroad buying is slow, and retail buying is on a hand-to-mouth basis, but fair as a whole. General industrial demand is good and increasing, since business is on the increase, and not suffering the usual big slump over inventory period. Implement, wagon and auto plants are in the list of active consumers. Eastern Kentucky car supply started off badly the first part of the week, but is reported to have shown improvement.

Prospects are said to point to better car supply as a result of open weather, and cleaning up of terminals by railroads during the holidays. Shops are also functioning better, and records of car and locomotive repairs show a good volume of work going through the shops.

Locally jobbers and operators are quoting mine prices in eastern Kentucky at $6.25@$7 on lump; $3.50@$4 on gas and steam mine run; and $3.25 @$3.50 on screenings. Western Kentucky prices are $4.25@$4.75 on lump; $2.50@$3 on mine run; and $2@$2.50 on screenings.

INDIANAPOLIS

Continued mild weather to what was expected has kept down demand, according to both Indiana operators and dealers in Indianapolis. So low has the demand been that retailers have cut off from fifty to seventy-five cents per ton on their prices and operators are making proportionate concessions. Steam coal is plentiful partly because many plants curtailed operations during the holidays. The car situation has improved to about 50 per cent. There is as yet no nervousness on the part of either industries or domestic consumers about trouble in the spring. There are practically no reserves in the state and industries haven't time now to build up big surpluses before April 1, operators say.

WESTERN KENTUCKY

Prices in the western Kentucky field are fluctuating considerably this week with car supply, which was very poor at the start of the week, but which has shown material improvement. Industrial demand is generally better. Utility buying is also good, but volume from railroads is only fair. There is every indication of a better stocking movement. The present market looks fairly good in view of the hand-to-mouth demand and car supply.

Reports show that during December car supply was below 30 per cent for the month, records showing the Illinois Central to have supplied 29.8 per cent; while on the Louisville & Nashville, only 22.4 per cent was supplied on the Henderson division, and 23 per cent on the O. & N. division, which resulted in a stronger market just before the holidays. Indications are for a better supply in January.

Prices at the mines show a considerable range, lump being $4.25@$4.75, with the bulk of movement at around $4.50. Mine run is $2.50@$3.25, mostly $2.50@$2.75. Screenings are quoted all the way from $2 for pea and slack to $2.50 for nut and slack, with bulk of sales at $2@$2.25.

CHICAGO

A slight softening of the market for steam sizes was noticeable during the past week. Improvement of the car situation with continued open weather during most of the week put enough coal on the market to give big steam buyers just the opportunity they constantly watch for. Domestic coal of every size remained in good demand and the result was screenings grew a trifle numerous. This naturally edged the screenings market down but the drop was small in most cases. Fifth Vein Indiana, for instance went off a quarter to $2@$2.25 and not much Fourth Vein sold over $2.50 though brokers contended the market ran up to $2.75 as it did the week before. Southern Illinois screenings held up to $2.75@$3.

Eastern coals continue to have a hard time getting through Cincinnati and Toledo on their way west. This keeps down the volume of West Virginia high-volatile as well as smokeless that reaches here. Eastern Kentucky undergoes some of the same handicaps but car supply is so short there that the effect is not so deeply felt around here. Elkhorn gas coal in 2-in. lump size brings $6.50 and 2 x 4-in. egg, $6. What little mine run is traded here moves at $4@$4.25. Harlan field quotations are about the same. From West Virginia it is noticeable around here that box cars are coming into use wherever coal can be disposed of in that kind of equipment at a price 50c.@$1 under the quotation for open-ton shipment.

SOUTHERN ILLINOIS

Car shortage started this week once again to make things interesting in the Carterville, Du Quoin and Jackson country fields and practically all roads are affected. Movement is slowing up and with cold weather prevailing there is an increased demand for everything. There seems to be nothing unbilled on track. Mines are getting from two to three days a week with the usual exceptions. Steam sizes show improvement. Prices on Du Quoin and Jackson county are $5@$5.50 for lump, egg and nut, with screenings at about $3 and steam nut ranging $4@$4.50.

Improvement is noted in the Mt. Olive field in the movement of steam and domestic, chiefly to the North and Northwest. The railroad tonnage in this field has been good. Steam is better than in the other districts. Prices range from $4 on domestic at St. Louis to $4.50 for country districts, with screenings at $2.25 and nut from $2.50 up. Car supply is fair, averaging three days a week.

The Standard district is tied up again on account of no cars. Conditions are extremely bad on the Illinois Central, the B. & O., Pennsylvania, and the L. & N. The Mobile & Ohio is getting on a par with the others too. Some of the mines average but one day a week. Prices are not good. Six-inch lump and 3 x 6 egg range $4@$4.25. Two-inch lump ranges $3@$3.25, with steam sizes, $2.50@$2.75 and screenings at $1.75@$2.

Railroad tonnage fair, but conditions generally are not good with the poor working time and low prices.

Eastern Inland

Empties Scarce Following Spurt of Heavier Loading

Holiday Idleness Brought Temporary Accumulation of Cars—Spot Buying Necessary to Eke Out Current Needs—Domestic Demand Unabated —Steam Prices Stiffen.

Holiday idleness provided an accumulation of cars which enabled mines to make inroads on their orders. Following this brief period of heavier loading, however, has come a return of the car shortage and empties are now as scarce as before Christmas.

Contract deliveries are good, under existing circumstances, but consumers must eke out their current needs with spot purchases. Railroads and other large users are taking stock coal and the offerings on the spot market are very meager. Domestic demand continues unabated and prices for steam grades as well have stiffened further during the week.

CLEVELAND

Prices of Ohio coal, which are being substituted to a large extent for West Virginia smokeless, semi-smokeless and anthracite, have been advanced 10c.@ 20c. This has been due largely to severe weather, which has affected transportation conditions. The railroads are taking large tonnages in this territory.

Public utilities and other large consumers are planning to build up storage piles this month and will continue to buy through February and March. The Cleveland Electric Illuminating Co., which supplies heat to a large number of business blocks and apartment houses and furnishes power for light manufacturing and street cars, has 75,000 tons in its yards, enough to last twenty-eight days. The present stock is a little larger than it has been recently. Homes, apartments and industrial concerns in certain parts of the city have been deprived of lights and electric power when a partial shutdown of the municipal light plant has been forced several times through inferior grades of coal finding its way into the plant's boilers.

Pocahontas coal is camparatively scarce in this market. Shoveled lump is delivered for around $13 a ton, and some mine run also is available. The price asked for this grade is $11.50 @$12.

EASTERN OHIO

During the last week of 1922, operations were accelerated somewhat by an improved car supply. Output was 290,000 tons, representing 56 per cent of potential capacity for the five-day week. Increase over the preceding week was 25,000 tons. Cumulative statistics covering production for 1922 show an aggregate output of 11,192,000 tons, or 36 per cent of potential capacity, based on railroad ratings.

At the current rate of operations and the comparatively small quantities of free coal available, there is a ready market for all that is offered and prices are stiffer. The railroads have only moderate amounts of reserve fuel on hand, and public utilities and other large consumers are doing some storing. However, the rank and file of industry continues to buy in a hand-to-mouth fashion and stock piles are at a minimum. Weather conditions have resulted in a constant demand from domestic consumers upon retailers and operators and jobbers report activity in that quarter.

The City of Cleveland recently opened bids on 40,000 tons of nut and slack for the waterworks. Lowest bid came from the Valley Camp Coal Co., Cleveland, for No. 8, at $2.90, contract running for six months, freight rate $1.70 per ton. Next lowest bid was from a middle district operator, offering No. 6 at $3.22, freight rate $1.45 per ton.

Receipts of bituminous coal at Cleveland were the largest on record during the last week of 1922, and local terminals report slow deliveries because of bunched arrivals and inability of several large receivers to handle. Total receipts were 3,332 cars, or about 177,000 tons. Of the total, 2,659 cars were consigned to industries and 673 cars to retail yards.

BUFFALO

Trading is not really brisk, although the snow storm, added to the car shortage, stiffened prices materially, but they are already dropping off again. Some of the shippers are trying to maintain the advance until there is a stir in anticipation of trouble in April, but as a rule this is looked on as too far away.

The disposition of operators to urge more and more coal on the market is a discouraging feature of the market. Jobbers make no secret of their disapproval of the tendency.

All quotations are subject to individual variations, as follows: $5@$5.50 for Youghiogheny gas lump; $4.75@$5 for Pittsburgh and No. 8 steam lump; $3.75@$4.25 for all mine run, and $3.25 @$3.75 for slack, adding $2.09 to Allegheny Valley and $2.24 to other coals for freight.

PITTSBURGH

The market is definitely quotable at a slightly higher average level. It has now been strengthening for three weeks.

Cars continue in short supply and there is much irregularity, both in the supply on a given division from day to day and in the supply comparing one division with another. Consumers are receiving moderately regular shipments from their usual sources of supply, but many are in the market from day to day for extra tonnages, making a fairly large volume of spot trading. To what extent consumers are stocking cannot be determined as buyers are indisposed to discuss such matters. The common assumption is that there is a good bit of stocking.

The latest gossip indicates the probability of a disagreement on April 1 with the U.M.W.

The Pittsburgh district market is quotable as follows: Steam mine run, $3.50@$3.75; slack, $3@$3.25; gas mine run, $3.85@$4; gas slack, $3@$3.50; domestic 1¼-in. lump, $4.50@$5. Some nut is being produced for the Eastern trade, and brings high prices, up to about $6.

NORTHERN PANHANDLE

Embargoes and congestion are still interfering to a great extent with the movement. There is a heavy demand for prepared grades and for steam coal, with the prepared sizes hovering around the $4.50-mark. Mine run prices, too, had stiffened somewhat.

DETROIT

Slow demand continues a prominent characteristic of the market. Offerings create little interest among buyers. While some sales are being made the business is mainly of an irregular nature involving only small amounts.

The closing of navigation of the Lakes has not brought the increase in shipments to Detroit that some of the buyers had expected. In fact, some of the jobbers say less coal is coming to Detroit than a month ago. One of the details apparently overlooked by the buyers, is the longer haul now involved, which requires the use of a large number of cars. Car supply also is reduced by the demands from other lines of industry.

Very little free coal is to be found on track. The larger proportion of the receipts comes from Ohio. Hocking lump is $5.25@$5.50; egg, $4.75@$5; run of mine, $3; nut, pea and slack, $2.75@ $2.90. Three-quarter lump, Pittsburgh No. 8, is $4.50; run of mine, $3.25; slack, $3. Lump from West Virginia or Kentucky is $5.50, mine run, $3.25; slack $3. Smokeless continues scarce with lump and egg about $8 and mine run and slack, $5.75@$6.

COLUMBUS

A stronger demand has developed since the holiday season. This includes all steam sizes as well as domestic grades. Prices have strengthened materially and indications point to a rather stiff market for the remainder of the month.

Hocking, Pomeroy and Cambridge lump are good sellers and there is also a good tonnage coming from West Virginia and Kentucky. Pocahontas is still scarce. Retail prices are strong but consumers are buying more liberally.

Steam business is showing considerable firmness. Large consumers are buying better as there is a growing likelihood of a suspension about April 1. Railroads and utilities are taking larger orders while the small manufacturers are showing a tendency to come into the market.

Production is somewhat heavier, due to better car supply, caused by the accumulation of empties after the two holidays. The Hocking Valley is producing about 40 per cent while the same is reported from Pomeroy and Cambridge. Eastern Ohio has been near the 50 per cent mark.

Northwest

Upper States So Used to Worrying They Are Callous

End of Fuel Administration Control Over Supply Is a Relief, Even Though Hard Coal Will Exhaust By Feb. 1 And Free Bituminous Totals Only 700,000 Tons.

The Northwest is breathing a sigh of relief now that the fuel administration has ceased to have charge of supplying that region with coal. The fact that there is only enough anthracite to last in dealers' yards to Feb. 1 is such common knowledge now that the people are getting used to it and are not worrying much, especially since the weather for a week has been mild.

The confidence felt in rail shippers to supply the region from the South all through the winter has removed much uneasiness over soft coal, of which it is estimated there is now only about 700,000 tons free at the docks. Shipments inland from the docks have been so tremendously heavy ever since the strike that the country has a little more bituminous on hand than is usual.

DULUTH

Shipments from docks during December ran pretty nearly to the high-water mark. In all 23,985 cars went out as against 13,444 in the same month in 1921. In November 20,638 cars were shipped.

The total number for the year shows how much more freely the Northwest is taking coal this season than last. During 1921 the total car shipment was 161,322 and in 1922 in all 245,683 cars were shipped. Until June in 1921 the average car shipment from the docks was around 5,000 to 8,000 monthly while this year the poorest month, April, showed 9,000 cars and the peak was reached in September with 26,000 cars. The demand has been steady, chiefly because many feared a shortage.

At the end of last week, a spell of mild weather caused a drop in selling orders, but coal still continues to go out in a steady stream on past orders. Anthracite is in demand everywhere. Calls come for coal from all Inland points, and there seems to be real suffering. The policy of reserving hard coal for those who have magazine stoves for heating still continues. Pocahontas is a feature of the market. It has climbed from $11.50 to $13 and supply is short. Coke is $12 and briquets, $10.50.

It is estimated that there are 700,000 tons of bituminous left free. If this estimate is anyway near correct, it would seem to indicate that the slightest slip-up in the all-rail delivery plans for the southern part of the state would cause a shortage. In fact, there will be no coal left on the dock for a surety when navigation opens, but there may be no want by that time.

MINNEAPOLIS

The coal trade is compelled to get along as best it can without the aid or hindrance of the fuel administration, which has wound up its work.

The hard coal situation is practically one of exhaustion. Less than half the reasonable needs of the Northwest were received up to the close of the extended period of navigation on the Great Lakes. Despite all economies through the open fall and early winter, and the use of other grades, the 550,000 tons received will not last through the season. In fact, the wholesale stocks are exhausted now and are all in retail hands. Retailers are distributing them steadily, and many will be entirely out of sizes very soon. Feb. 1 will probably see many retail concerns practically without hard coal.

The soft coal situation is steady, though without a great deal of support. The mild weather took the edge off buying, after the two weeks of cold weather braced the market sharply. As long as mild weather prevails, there will be no real support to the market. On the other hand, it is unlikely to go soft, with strong markets reported in other centers, and shipments several weeks behind. That will prevent any excess coal being sent into this market. It is this practice that has generally upset things here. With that removed, there will be a much steadier soft coal market.

MILWAUKEE

There is a good demand and dealers are kept busy filling urgent orders, as few consumers entered the winter with anything like reasonable supplies. Anthracite is being distributed in small lots. There have been some complaints of discrimination, but the State Fuel Commission is satisfied that dealers are acting fairly both to the city and country trade, notwithstanding there is an advantage to them of 75c. per ton in favor of dumping into city trucks as against loading cars.

Just when the shortage of anthracite will become acute is problematical, but it is admitted that severe cold weather will mean hardship in the country. To avoid such a condition, the state authorities are considering the commandeering of all anthracite on the docks at Milwaukee.

The car situation is wretched, and country shipments are two or three weeks behind. Industrial plants are showing an inclination to re-establish storage piles, now that it is certain that coal will not be any cheaper this winter. Illinois and Indiana screenings are still scarce and firm. There seems to be no inclination on the part of dealers to disturb prevailing prices. Soft coal and coke are being extensively substituted for hard coal both here and in the country.

New England

More Inquiry for Spot Coal; Heavier Use of Steam Seen

Buyers Awaken to Situation—Short Car Supply and Holiday Delay Are Factors—All-Rail and Water Movement Checked, Putting Contracts Behind.

In all directions spot coal is in better request. Buyers are awakening to the current situation, and in most lines of manufactured goods there is enough better business to mean increased use of steam. Short car-supply is another governing factor and the holiday period of extremely light shipments has brought home to many consumers the delays that follow rough weather. Both all-rail and by water the movement of coal has been checked, and doubtless it will take the balance of January in most instances to catch up on contract quotas.

In Central Pennsylvania practically all grades have further advanced in price the past week. At Hampton Roads the market is also notably firmer.

Favored grades from the Cambria districts have sold up to $6 per net ton and quotations still higher are looked for in the near future. Even moderate to poor grade coals have sold recently at enhanced prices, and while a seasonable thaw and a better run of anthracite would tend to hold things down it is quite possible spot prices will reach $7 on average grades within a reasonably short time.

It is rumored here that $9.25 at the Roads has been paid for tail-ends, but an average figure on what little volume has been available for spot sale would probably be $8@$8.50 per gross ton f.o.b. vessel. Shipments latterly have been rather in favor of prepared sizes to the West, but with more inquiry at the Virginia terminals it is quite likely that the volume will increase in that direction. Practically all the factors are making only small deliveries on contracts, urging as a reason the meager output during the whole of December.

The textile manufacturers are showing more interest in the current situation. This is due partly to decreased water power, but the improvement in the market for goods is really accountable. The prolonged strike very much reduced the available supply of goods, and now with any prospect at all the cotton mills are expecting to run full during the remainder of the season.

Cincinnati Gateway

Byproduct Buyers Again Prominent in the Market

Feeling-Out Process by the Wholesalers Is Strongly Defined — More Rapid Movement of Coal Demands Caution.

After a lull of several weeks byproduct buyers are again the prominent feature of the market. They have not been bunching their purchases to the degree that was noticeable in November but their requirements have been sufficiently strongly shown to bring that type of coal back to the spread that it was enjoying over the price of steam and splints.

The transportation situation has surprised some of the astute observers. Both the C. & O. and the L. & N., through quickened movement of loads off of branch lines, have shown that accumulations have been pretty well worked out. The N. & W. is not in such good trim, which is indicated by the small shipments to Inland and Western markets. Prices west, however, were given an upward boost of proportions to start the new year off right.

CINCINNATI

The market can be said to be divided into two camps. Direct mine representatives are pretty well sold up with their coal while the jobbers and wholesalers are laying back and using a "feeling-out process" in the hope of discovering which way the prices will move. Most of the latter are taking coal on a quick turnover basis, while the former have sold on the upturn for the coming month and hoping that their judgment is correct.

Because of the better movement of steam coal prices on high-volatile run of mine have shown but little change. On the other hand, the rush of buying orders for gas and byproduct coals has sent these upward.

Producing companies changed the price on smokeless lump to contract takers to $7 the first of the year, some asking $7.50. Brokers on the other hand are asking $8@$8.50, which indicates that they still have difficulty in getting car numbers. Low-volatile run of mine, nut and screenings are stronger due to the Tidewater situation.

Retailers have made no change in the price line up but declare that any further advance in the cost of smokeless will force them to readjust.

HIGH VOLATILE FIELDS

Kanawha

As was to have been expected, production was curtailed by the holiday idleness. When the men did return to work there was a larger supply of empties, but by the end of the week the supply was exhausted. What little tonnage there was mined was consigned to Western markets, much of it for regular customers, so that production was far from keeping pace with demand.

Logan and Thacker

There was no improvement worth mentioning in the Logan district during the final days of 1922, but the lack of cars made somewhat less difference as there was a complete suspension of operations for a day or so during the holiday week. Not only were inquiries growing in volume, but producers were being pressed for early delivery, which was difficult owing to the slow movement of loads to Western points.

Northeastern Kentucky

Idleness at the mines over a period of several days gave the C. & O. a chance to accumulate cars but the supply was soon used up. With production curtailed, and with buying on a heavier scale, prices have climbed a peg or two.

LOW-VOLATILE FIELDS

New River and the Gulf

The Christmas suspension tended to restrict the output of the New River territory to some extent though it was possible to offset in part the losses so sustained by heavier loading when the miners returned to work because cars had accumulated during the several days of mine idleness. The increased supply available, however, was only temporary. Transportation and market conditions are instrumental in diverting the bulk of the output to Easten points. The movement to Tidewater is as heavy as is possible in view of curtailed production. Westward movement is retarded by rail congestion.

Had there been a full week of work in the period ended Dec. 30, it would probably have been possible for Gulf mines to increase the output a little since the Virginian is gradually getting back to a normal basis with its motive power. Most of the coal so produced is being handled to Tidewater where there is an active demand. Prices are gradually creeping upward.

Pocahontas and Tug River

The Pocahontas field had a larger production to its credit when the year closed than at any time since 1916 but the increase of 25 per cent for the year as a whole was not made possible by conditions such as obtained at the end of December. There is a heavy pressure from many sections for Pocahontas fuel, a demand greater than it is possible to supply.

Tug River production was affected by the holiday suspension though idleness did not last throughout the week and it was of course possible to load on a little larger scale once the miners were back, since cars had accumulated. There are not as many empties coming from the West, however, as are needed to take care of the demand so that an unusually large proportion of the output is going to Tidewater.

West

SALT LAKE CITY

Stocks are getting low in many local bins as a result of people not putting in a full winter's supply of coal last summer and fall. The retail price of lump five or six months ago was $9. Now it is $10. It is felt that more staple prices would be better for all concerned—operators, dealers and the public—as business would then be steady and people would not wait to see what changes in prices would be made before ordering coal. The last change, however, in this locality was unavoidable, being the result of the strike. Car supply is adequate and there is plenty of high grade labor available.

KANSAS CITY

The new year opened with little change in market conditions here. The weather has continued mild. Partially as a result of the weak domestic demand, and partially because railroad service always improves with the weather, the car situation is better. The Oklahoma and Arkansas fields, the products of which must travel farther to market than those of the Kansas field, are the greater sufferers. Kansas coal is quoted at $5.50 for lump; $5 for nut; $3.75 for mine run, and $2.50 for screenings. Arkansas semi-anthracite lump is quoted $6@$8; mine run, $3.50@$4.50; screenings $2.

DENVER

Rail service is steadily improving so that nowadays, with 60 per cent car supply in Colorado and supply running up to 75 and 76 per cent in Wyoming the Rocky Mountain fields are enabled to get out a good deal of coal. Demand remains steady for all domestic sizes and steam is picking up slightly with industrial improvement.

Many companies in this state are planning considerable property improvements for 1923, including the Producers Coal Co., which is opening a new mine in Moffat County. The Moffat, C. F. & I., Colorado-Utah, National, and Victor-American companies all have plans for extensive improvements at their various mines, so that the state may be in better position to produce a heavy output during the coming year.

Toronto

TORONTO

There is little change in Toronto market conditions, the most noticeable feature being the increasing use of substitutes for hard coal, very little of which is now coming in. Householders are largely using bituminous coal, coke and briquets, many finding it impossible to obtain anthracite. Receipts have been much below the 60 per cent of normal supply understood to be allotted to Canada and it is claimed that Ontario is credited with carloads which are merely passing through en route to the West. Cases of actual distress which occur are being looked after as much as possible. The industrial demand for bituminous shows little if any improvement.

News Items From Field and Trade

ALABAMA

The Empire Coal Co., owing extensive coal properties in Walker County and at present operating several mines in the Warrior field, will soon begin construction of a byproduct plant to cost approximately $1,500,000, according to announcement of Walter Moore, president. A battery of forty or more byproduct ovens of the latest design will be built. The new ovens which will take the place of the bee-hive battery now operating at Empire mines, will be placed in close proximity to the coal supply and be so situated as to be served by the Warrior River transportation system and the newly projected branch of the L. & N. The ovens are to be ready for operation by July 1.

Edmund Ewing has resigned as superintendent of the Bessie Mine of the Sloss-Sheffield Steel & Iron Co. to become assistant to Vice-President James E. Strong, of the Alabama Co., and will be in charge of operations of coal mines, effective Jan. 1.

CALIFORNIA

For the first time in the history of the Pacific Coast the **toggle bucket is being used successfully at Los Angeles harbor** to remove coke from the holds of vessels. The new scheme is expected to revolutionize coke activities on the Pacific Coast. Heretofore coke has always been removed with shovels. With the advent of the toggle bucket and the hoist the work can be accomplished in half the usual time. The coke is not broken when unloaded with the bucket, a great improvement over the shovel method.

The Columbia Steel Corporation has sent out inquiries for equipment needed in extending its plant in Pittsburg.

COLORADO

The Champion Coal Mining Co. has incorporated at Durango with a capital of $50,000. L. D. McCormick is general manager and work will be started on a mine near here.

A wreck on the Moffat road Dec. 30 near Corona blocked the shipment of 2,500 tons of coal a day from the Victor American Fuel Co.'s mines in Routt County. These mines have up until recently worked only from two to three days a month on account of the continuous interruption of transportation service and inadequate car supply.

The **Colorado Fuel & Iron Co.,** has opened its rail mill at Pueblo with a 75 per cent normal force re-employed. This means employment for 1,000 men in the mills and an additional 700 miners in the mines. The mills will require from 5,000 to 6,000 tons of coal a day.

The Moffat tunnel injunction suit by Jefferson County to prevent the state from issuing state bonds were denied by the Colorado Supreme Court and has been appealed to the U. S. Supreme Court. This tunnel would mean the adding of 300,000 tons production a month to the state, raising the states total to more that a million more tons a month.

CONNECTICUT

The American Coal Co., Hartford, recently increased its capital stock from $50,000 to $100,000, to be used in increasing the business facilities of the concern.

ILLINOIS

F. R. Johnson, of the **St. Louis Coke & Chemical Co.,** with plants near Granite City, recently spent some time on business for his company in Chicago. He is in charge of the raw materials department of the firm and is located in the main offices of the company in St. Louis.

The following **itinerary of the Illinois Miners' Examining Board,** has been announced by Robert M. Medill, of Springfield, Director of the Department of Mines and Minerals of Illinois: Edwardsville, Jan. 8; Harrisburg, Jan. 9; Herrin, Jan. 10; West Frankfort, Jan. 11; Duquoin, Jan. 12; Sandoval, Jan, 13; Litchfield, Jan. 15; Springfield, Jan. 16; Decatur, Jan. 17; Danville, Jan. 18; Canton, Jan. 19 and Peoria, Jan. 20.

George W. Gosnell, of Herrin, formerly county mine inspector, has been appointed by Governor Small to the position of **state mine inspector** for the 12th district, comprising Williamson and Johnson counties. He succeeds **W. L. Morgan,** of Greenville, who was recently appointed as state mining investigator. Mr. Gosnell has served several terms in the capacity of county inspector.

John J. Watt, secretary-treasurer of the Springfield subdistrict of the United Mine Workers, has announced that proceedings to **contest the re-election of Frank Farrington** as state president of the union will be instituted at once. Alleged fraud in the counting of the ballots will be the basis for the suit.

A resolution condemning President Farrington, of District No. 12, Mine Workers of America, for ordering strikers back to work on a mine at Green Ridge, on the ground that the mine was idle in violation of contract, and demanding that he state his position as to the legality or illegality of the strike, has been passed by members of Local Union No. 2897, Subdistrict No. 6.

The Willis Coal & Mining Co. of St. Louis, Mo., has filed suit in the federal court against the Mobile & Ohio R.R. to collect $140,620.18, alleged to be due for coal furnished for the two years prior to July 1, 1922. For many years this shipper and carrier were regarded almost as partners. The Willis company held for many years the contract for Mobile & Ohio fuel coal from its many mines on the Mobile & Ohio in Illinois. Competition waned and mining, it is asserted, became unprofitable at other mines on the Mobile & Ohio. The Moffatt Coal Co. of St. Louis now furnishes most of the Mobile & Ohio coal from one big mine in Illinois and other mines near Blocton, Ala.

Mine No. 18 of the C. W. & F. Coal Co., Herrin, broke a hoisting record Dec. 18, when 4,357 tons of coal were raised in eight hours, making a total of 1,381 dumps. The previous record for eight hours was 4,175 tons. An interesting feature about the record is that the employees did not set out that day to make a record but owing to the fact that all of them did exceptionally good work, they were able to make this remarkable lift of coal. George Parson is the engineer at this mine; Fred Hauck, superintendent and T. F. Bailey, mine manager.

INDIANA

A "right-to-work" bill aimed at unionism in Indiana will be filed with the next state Legislature, the first bill of its kind the state has ever seen. The measure would make it unlawful for any person or persons acting singly or jointly with another or others, by means of any kind of force, threats, coercion, intimidation or violence, to cause or induce or attempt to cause or induce any person engaged in a lawful occupation to quit such employment, or to refuse or decline to accept or begin a lawful employment." Punishment for a violation of the act would be fixed at imprisonment of not less than sixty days nor more than two years and in addition a fine of not less than $50 nor more than $1,000 might be imposed.

Plans are being drawn for the **J. K. Dering Coal Co.,** of Chicago, for the construction and equipment of a **coal washery** at Clinton. The building will be one story, 50 x 125 ft. and, together with its equipment, will cost approximately $50,000.

An ordinance for regulation of retail coal sales in Anderson, will be introduced in the City Council there. The measure, if passed, will require that dealers supply each purchaser of coal with a duplicate check as to the gross, net and tare weight and the name of the quality or grade of coal sold, and by whom sold or weighed. It further is provided that a license fee be required and that the fees be applied to the salary of the inspector of weights and measures.

The Bicknell Coal Sales Co., of Indianapolis, has filled a final certificate of dissolution with the Secretary of State.

The Knox Region Coal Mining Co. has been organized at Indianapolis with a capital stock of $450,000 for the purpose of mining and distributing coal. The organizers are W. P. Worth, H. A. Huskey, Carl J. Fletcher, H. H. Taylor, E. A. Ogle, Burrell Wright and C. H. Hassmann. All the organizers are well known in the Indiana field.

IOWA

Coal in a 2-ft. vein has been discovered at Spickard at a depth of 145 ft. A mine will be opened on the Austin farm, one and a half miles northeast of Spickard. The site of the mine is a gully with hills on either side. A much thicker vein is expected to be uncovered when the entries are run from the shaft. It is reported that a thicker vein is located 50 ft. further down.

Federal Judge George C. Scott has issued an order **restraining the receiver of the Cedar Rapids Ice & Coal Co.** from selling the company's property. This action prevented the sale of the property Dec. 20. The order issued by Judge Scott is temporary. A hearing was held Dec. 20 at Waterloo. The Cedar Rapids Ice & Coal Co. became an involuntary bankrupt last autumn and Oct. 16 a receiver was appointed. The proposed sale Dec. 20 had been planned because the state court of Iowa, the body which appointed the receiver, had sanctioned the proposed plan.

KANSAS

The Spencer-Newlands Coal Co. is experimenting in opening a 20-in. seam west of Mulberry with special stripping equipment. In the past working these seams in this country has not been equipment. If the new method is profitable it will be followed by other firms and thousands of acres in Crawford County will furnish years of additional mining operations.

KENTUCKY

The Big Four Coal Co., of Candill, whose post office address is Hammond, has been purchased by W. J. Raybold and others of Whitesburg, who will increase the capacity of the plant and lease and develop additional properties.

The Big Seam Coal Co. has been incorporated at Creeck, with a capital stock of $45,000, and with C. H. Lewis, J. D. Yarbrough and McKinley York as the incorporators.

The Gorman-Meguire Coal Co., of Jeff, has announced that it will make some extensive improvements on its property, including the erection of a new tipple.

A. C. Craft, Jr., and **Tilden Wright** have leased coal lands at Millstone, Ky., and will develop the same.

New Kentucky corporations include: **Big Six Coal Co.,** Livingston, $10,000; R. F. Quinn, John Cockrell and A. Richardson. **Clear Fork Coal Co.,** Middlesboro, $150,000; S. M. Reams, B. T. Milan and T. G. Anderson. **Dixie Land & Improvement Co.,** Stearns; $5,100; A. F. Wheeldon, R. W. Henderson and Mark Gibbs.

The Laib Co., Inc., Louisville, manufacturers of plumbing, heating, mine and mill supplies, has filed a petition providing for an increase in capitalization from $150,000 to $900,000.

Recent charters filed by new coal companies are: **Black Raven Coal Co.,** Louisville; capital $100,000; W. J. Borris, Arthur N. Sager, E. L. Williams, and K. U. Meguire; to enlarge production of the Gorman mines in the Hazard field. **Paint Cliff Mines Co.,** Louisville, operating in eastern Kentucky, amended articles increasing capital from $50,000 to $75,000; signers, K. U. Meguire, Sol S. Smith and A. C. Van Winkle. **Wallins Creek Coal Co.,** $100,000, from $50,000, Louisville; mines at Wallins Creek, eastern Kentucky; T. L. Young, L. H. Stone and J. S. Laurent. **Phoenix Fuel Co.,** Louisville, jobbers; amended articles increasing capital from $10,000 to $25,000; Frank J. and R. A. Ambach, S. D. McLaren and W. B. Talbot. **Providence Coal Mining Co.,** Webster (western Kentucky); increasing capital from $250,000 to $500,000.

Gus Noffsinger, general manager of the Southland Coal Co., was found dead at his garage door at Henderson, Dec. 31. A coal miner's hammer lying about 60 ft. away was the most important clue uncovered in the investigation of his death. Noffsinger was believed to have been killed instantly by a blow on the back of the head. An analysis of stains on the hammer to determine whether they were caused by blood was ordered.

That Noffsinger was struck down by a disgruntled former workman was the most plausible theory, according to investigators. Noffsinger last was seen alive when he started home after a conference at a local hotel with Edward Potter of Nashville, Tenn., president of the Southland company. He was a native of Central City and is survived by his widow and one child.

MASSACHUSETTS

Foreign coal landed in Boston Harbor in 1922 totaled 1,527,172 tons, the first shipment having been received June 27, when 3,707 tons of Hastings unscreened coal was brought in from Wales. There were 234 boats used in bringing this coal, the average cargo for the entire period being 6,526 tons. Shipments reached their peak in September, when 476,249 tons were received. During December the receipts were 139,728 tons. The heavy receipts have involved heavy demurrage charges, which in some instances undoubtedly caused a loss rather than a profit on a number of the cargoes.

MINNESOTA

The Stott Briquetts Co. of Superior, Wis., recently had as its guests the officers and sales force of the Northwestern Fuel Co. at a dinner held at the Minnesota Club, St. Paul, Minn. The Northwestern is the sales agency for the Stott concern.

The new 12,000-ton steamer of the Kinsman Transportation Co., now building at the yards of the Toledo Shipbuilding Co., will be named the "Wonell Clarkson," after the president of the Clarkson Coal & Dock Co., of Duluth and Ashland, Wis. The steamer will be put in commission April 15, 1923.

MISSOURI

The Polar Wave Ice & Fuel Co., at St. Louis has by a stock dividend increased its capital from $1,800,000 to $5,400,000. This represents the surplus for a few years past, which has been transferred to capital account. This is a retail coal and ice firm. **The Romann & Bush Pig Iron & Coke Co.** increased its capital from $20,000 to $70,000.

NEW YORK

William H. Woodin, who resigned as State Fuel Administrator, effective Jan. 1, continued to perform the duties of the office last week in the absence of word from Governor Smith as to the appointment of his successor. Commenting on a report that General George W. Goethals was being considered for the post, Mr. Woodin said he thought General Goethals would be "an ideal man for the post." General Goethals said he knew nothing about the report except what he had seen in the newspapers, and would not comment upon it.

Acting on reports received from the Police and Health departments William H. Woodin, State Fuel Administrator, on Jan. 6 **ordered the immediate distribution of 6,000 tons of coal to residents of Brooklyn and Queens** who are without fuel, although able to pay for it. He sent a communication to E. W. Parker, National Director of Fuel Distribution in Philadelphia, urging preference for coal shipments to this district because of the emergency that has arisen.

E. J. Berwind, president of the Berwind-White Coal Mining Co. has declined to make any comment or statement concerning the charges contained in the report of Mayor Hylan's committee that investigated labor conditions at the Berwind-White mines in Pennsylvania.

OHIO

William T. Latta, for years engaged in the coal business in Indianapolis, died recently in Seattle, where he had gone three years ago. The body was taken to Indianapolis for burial. Interment was in Eagle Creek cemetery near Zionsville, Ind.

John Marchesi, a New Philadelphia operator, has purchased three mines and a considerable coal acreage from the Scott Coal Co., at Midvale. The seller reserved a retail coal yard in Akron which will be operated by John Scott, principal stockholder in the Scott Coal Co. The capacity of the mines is about 800 tons daily.

The Monarch Coal Co., chartered some time ago at Columbus, with a capital of $30,000, by E. E. Learned, L. M. Buchannan, E. Gilbert, Ray Cheek and R. H. Learned, is negotiating for the sale of a mine in the West Virginia field which may soon change hands.

PENNSYLVANIA

The Pittsburgh Coal Co. has resumed dividend payments on the common stock at the rate of $4 a share annually, by the declaration of a quarterly dividend of $1 a share. Only three months ago, much to the surprise of stockholders, the directors passed the quarterly dividend, which then amounted to $1.25 a share. The dividend now declared is payable Jan. 25 to stock of record Jan. 5.

The Pennsylvania system of mine inspection has been the model for many states and foreign countries, Governor Sproul told the Legislature when it convened Jan. 2. He made his final message to the Legislature, part of which he read in person. Statistics and details of the departments he presented in printed form to the members. Speaking of the mine-cave situation and the decision of the U. S. Supreme Court, holding the mine-cave legislation unconstitutional, the Governor said that a way to meet the question should be devised. The right of the public to appropriate by eminent domain with compensation to the miner's hammer lying about 60 ft. away he pointed out.

The modified plan of the **Lehigh Valley R.R. for the segregation of its coal properties** has been submitted to Attorney General Daugherty and it is expected that a decision on the matter will be forthcoming in about a month. The Lehigh Valley's plan for the segregation of its coal properties, announced Oct. 7, 1921, was in accordance with the United States Supreme Court's decision of Dec. 6, 1920. The plan was filed in the United States District Court of the Southern District of New York, and at the same time the government filed three objections. Representatives of both parties have been at work since in an effort to come to an agreement on a modified plan, which it is understood has been accomplished in a series of conferences between representatives of the railroad and the Attorney General's office.

One hundred and twenty of the executive, sales and operating personnel of the **Bertha Coal Co.,** Pittsburgh, met in the company offices, Dec. 30, to outline plans for 1923. Following a meeting of the sales department with C. F. Ingold, vice-president and sales manager, and a meeting of the operating department with John H. Jones, president of the company, the entire personnel of the company took luncheon with the Board of Directors at the Chamber of Commerce. Among the various resident managers of the company present were: George N. Reed, New York; Horton J. Davis, Corry, Pa.; T. P. Jones, Cleveland; H. A. Thompson, Covington, Ky.; Vaughn J. Jolliff, Detroit; H. L. North, Akron, and C. S. Gilmore, Grand Rapids, Mich.

TEXAS

The property of the **Anderson County Coal Co.** six miles west of Palestine has been sold to the **Ligol Chemical Co.,** of Houston. The property will continue operations but new machinery is being installed for the manufacture of byproducts, especially carbon. This lignite coal is of a peculiar quality for byproduct purposes. The Ligol Co. has another mine in Grimes County and a byproduct refining plant at Houston. J. J. Barry is in charge of the property here.

UTAH

The Columbia Steel Corporation has sent out inquiries for byproduct coke ovens and auxiliary equipment for a proposed installation.

Wm. D. MacLean, general sales agent of the Standard Coal Co., Salt Lake City, for several years, has been elected vice president of the company. He is one of the best known coal men in the mountain country.

VIRGINIA

Argument has been completed in the Norfolk Circuit Court in the case of the **Norfolk & Western against the Pan-Handle Coal Co.,** growing out of the controversy which arose early last year over the manner in which demurrage charges had been assessed at the Lamberts Point Coal Exchange. The railroad claims the coal company in this case owes $3,200 and the company claims it has overpaid by $1,000. The original case was filed by the members of the exchange who constituted the Hampton Roads Demurrage Committee, of which W. W. Houston, manager of the Pan-Handle Coal Co. at Norfolk, was chairman. The committee asked the Interstate Commerce Commission to investigate the manner in which demurrage was assessed and asked the Circuit Court to restrain the railroad from collecting demurrage charges under the system of assessment it had employed. The court decided against the coal companies, as did the Virginia Supreme Court of Appeals. The case has not been decided in the Interstate Commerce Commission. Judge Hanckel in the Circuit Court has given the attorneys for the Norfolk & Western twenty days in which to file a brief, and has given the coal company's attorneys ten days additional to file their reply.

WEST VIRGINIA

W. P. Beveridge, of Wichita, Kan., purchased a coal mine at Lillian, and is arranging **to operate it on a co-operate basis.** He has chartered the concern as the Beveridge Co-operative Coal Co., of which he retains 50 per cent of the stock, while the coal miners are to own the other half. The men are to work for $6 a day and every three months the profits are to be divided on a 50-50 basis. The plant will be operated on a non-union basis and none but stockholders will be employed. It has a capacity of 200 tons daily.

A. J. Dalton, of Omar, Logan County, and associates have obtained a certificate of incorporation for the Main Island Coal Corporation, representing holdings of more than 28,000 acres of valuable coal lands in Logan County and with an authorized capitalization of $25,000,000. It was formed by the consolidation of the Main Island Creek Coal Co., Omar Coal Co. and Middleport Coal Co. all operating in Logan County.

J. W. Smith, secretary-treasurer of the Raleigh and Wyoming County Mining Institute, has taken a position with the **Algonquin Coal Co.,** Algonquin. He was previously employed by the Coal River Collieries Co.

On Jan. 16 the Main Island Creek Coal Co. will open its Y. M. C. A. at Stirrat, which the company has erected for the benefit of its employees at a cost of approximately $200,000. Employees and their friends are invited to attend the opening, beginning at 2 P. M. There will be a free picture show, dancing and refreshments.

The Weyanoke Coal & Coke Co. and the S. J. Patterson Pocahontas Co. have been consolidated as of Jan. 1, 1923, as **The Weyanoke Coal & Coke Co.,** capitalization of which has been increased to $1,000,000. Both of these companies are in close proximity, mining the third-vein Pocahontas seam at Springton, and were owned by practically the same interests. R. D. Patterson, of Dayton, Ohio, being president of both companies, and the S. J. Patterson Co. of Dayton, Ohio, exclusive sales agents for the entire production of these mines. The S. J. Patterson Co. of Dayton, Ohio, maintaining a Chicago office in the Old Colony Building and represented by the J. W. Lowe Co. in New York, will continue to market the product of these mines.

S. W. Riddle, of Chattanooga, accompanied by Clyde Palmer, manager of the Cincinnati office, were on a two weeks visit to the Blue Star mines of the Riddle corporation. R. O. Farrell of the Chattanooga office has been transferred to Cincinnati and H. R. Bonnell, formerly with Jewett, Bigelo and Brooks, has also joined the Riddle forces.

Recent visitors to Cincinnati were **Lawrence Snapp,** president of the United Fuel & Iron Co., of Pittsburgh, who was on his way to his mining properties at Darby and St. Charles, Va.; **J. R. Charlton,** of the West Virginia-Elkhorn Coal Co., of Boncar, W. Va., and **W. G. Chelf,** an operator of East Bernstadt, Ky.

WYOMING

Heavy snows has stopped work on surface plant of the **M. H. Shields Coal Co.,** six miles from Gillette, Wyo. The vein is 96 ft. thick and the top of the seam is under 20 ft. of cover. Drift mining must be employed, as the vein runs under a hilly rise. M. H. Shields is president and Thomas Hotchkiss is general manager.

CANADA

The Cape Breton collieries will be so active during the winter that some of them will be placed on double shift.

J. B. McLachlan, secretary of District 26, of the United Mine Workers, **demands that the workers take over operation of the bituminous-coal mines** of eastern Canada. Further, he has announced publicly that he is strongly in favor of a communist government for Canada and will fight tooth and nail for such a government.

The U. M. W. called an **open meeting at Glace Bay to discuss the soft-coal mining situation.** The principal speaker was Trover McGuire, of Toronto, who was recently arrested for alleged treasonable utterances and sedition but was liberated because of his meritorious war record, he having won the distinguished conduct medal while in action with the Canadian Expeditionary Force in France and Flanders. McGuire urged the members of the U. M. W. in District 26 to rebel and take over the mines by force.

The Rev. J. J. Nolan, Roman Catholic priest, and **the Rev. A. Bull,** Church of England minister, of Leading Tickle, Newfoundland, **discovered a seam of coal** recently and staked it on behalf of their respective churches, which are co-operating in sinking a shaft and installing other equipment.

During the British Columbia legislative session, which has just closed, **an effort was made to amend the Coal Mines Regulation Act** in order that coal miners might appoint representatives on gas committees other than from their own number. They wanted the privilege of nominating outside men. The majority of members of the House, however, held that such latitude might lead to abuses that would seriously affect the industry and the amendment was defeated. In the debate attention was drawn to the serious results of the large importations of fuel oil into the province from the United States. It was said that 90,000 tons of British Columbia coal per month was being driven from the local markets. Local coal was unable to meet the competition. One large mine already had been closed down on Vancouver Island and the time had arrived for the Dominion to impose a heavier duty on fuel oil coming from outside in order that the provincial coal industry might be saved.

R. M. Macdonald, of Blairmore, has been elected international board member of District 18, United Mine Workers of America, comprising southeastern British Columbia and Alberta. He succeeds Robert Livett. **William A. Sherman** has been re-elected president by acclamation and **William Ryan,** vice-president, and **Robert Peacock,** secretary-treasurer, were returned to office.

The British Empire Steel Corporation is devoting much attention to meeting the demand for coal of a good quality. The method of undercutting the coal has been changed in several of the collieries to insure large and clean coal. The transportation, cleaning, absorbing and screening processes also are being improved.

Charles Murphy, general manager of the western lines of the Canadian Pacific Ry., states that at present 75 per cent of the coal used in Winnipeg comes from Alberta. All the Western mines are now working except some in the Edmonton district, where there is a strike of small proportions. As most of the coal supply comes from Drumheller and Lethbridge, the strike is an inconsiderable factor of the situation. In order to further encourage the use of Alberta coal in Manitoba and at other Eastern points the Calgary Board of Trade and the Western Canada Coal Operators' Association have decided to continue the campaign begun with this object. Letters will be sent to Manitoba merchants, clubs and societies asking for support of the effort being made to develop the coal trade within the Dominion.

International Fuel Co., Ltd., of Toronto, has been incorporated with $40,000 capital stock. The provisional directors are Gerald M. Malone, Albert Mearns and Gertrude Wallis.

Twenty candidates sat for examinations conducted recently at Nanaimo, Fernie, Merritt and Cumberland, B. C., by the Board of Examiners appointed under the Coal Mines Regulation Act. They wrote for first-, second- and third-class certificates, although the majority took papers of the two latter classes. Of the twenty who offered, ten were successful, and the board in its report observes that most of the candidates for second-class and a few of those for third-class certificates possessed a knowledge of mining matters and gave proof of a general education considerably above those usually manifested by aspirants for these certificates.

WASHINGTON, D. C.

The Secretary of the Interior has requested a deficiency appropriation of **$10,000 to cover the expense of administering the Leasing Act as it applies to coal.** Coal development on the public lands is proceeding faster than had been anticipated. On June 1 there were 240,000 acres of potential coal lands under lease. On Oct. 1 the total had grown to 340,000 acres. The 500,000 acre mark was reached on Nov. 8. To meet this situation, the Bureau of Mines, which is charged with the administration of the Leasing Act, has been forced to take men from its other work and to borrow personnel from the Land Office.

Obituary

A. I. Dexter, age 76, one of the pioneer industrial men of the district and a director in the Bessemer Coal, Iron & Land Company, died at Birmingham, Ala. Jan. 1. Mr. Dexter moved to this district in 1896 from Whitewater, Wis., and was actively interested in the development of coal and iron properties for a number of years following. He was born in West Topsham, Vt., but interment took place at Whitewater, Wis.

Traffic News

In the Dec. 14 issue of "Coal Age" a news item stated that "An effort to increase the first zone coal freight rate was resisted by northern West Virginia coal shippers when that question came up for a hearing before representatives of the Interstate Commerce Commission on Dec. 4 in connection with the case of the Pittsburgh Coal Co. against the P. C. C. & St. L." This was an error, as the Pittsburgh Coal Co. was not a party to the case. The plaintiff was the **Pittsburgh Coal Producers' Association.**

The I. C. C. has assigned for hearing in Washington Feb. 15 and 16 the **Western coal-rate case.**

The Missouri Pacific R.R. has issued Circular Letter No. 299-A, urging shippers to make the best possible use of equipment, so that the greatest number of people may be served, and as many lines of business as possible be kept in operation. The following suggestions are offered: (1) Load cars to their full carrying capacity; (2) unload cars promptly; (3) reconsignment requests should be placed promptly.

The attention of the Interstate Commerce Commission has been called to the **poor showing being made by the Chesapeake & Ohio** in the movement of coal in other than private cars. It is alleged that coal in privately owned cars is being dispatched promptly at the expense of coal in cars of railroad ownership. It is declared that 80 per cent of C. & O. system coal cars are on its line, but that coal mines are not being supplied with the maximum possible number of cars, due to the fact that they are held for unnecessary periods under load.

Oral argument on the complaint brought by the **Southern Ohio Coal Exchange against railroads serving the southern Ohio field,** as to differentials on freight rates betwen Ohio and the so-called inner and outer crescents of West Virginia, will be heard by the I. C. C. Jan 23. In the report of the special examiner named to take evidence the contestations of the defendant roads were upheld. This report is only tentative and must be approved by the I. C. C. before it is effective.

An investigation of the shortage of coal cars in Kansas was started by the Kansas State Public Utilities Commission Jan. 3, with a hearing at Pittsburg. The investigation is inspired by complaints of dealers and consumers of delayed deliveries. The most recent was by the firm that supplies state institutions with coal, which attributed slow deliveries to lack of cars.

G. C. Randall has been appointed district manager of the Car Service Division American Railway Association, with headquarters at Dallas, Texas, effective Jan. 1, 1923. Mr. Randall will have the authority of the Car Service Division in the states of Texas, New Mexico, Oklahoma, Colorado, Louisiana and Arkansas and other outlying points as may be directed.

The Illinois Central is ready to buy and build a new line 125 miles long between Edgewood and Paducah, Ky., cutting down the distance between Chicago and Memphis by 22 miles. It will cost approximately $1,500,000. The Illinois Central is buying the Kentucky Midland R.R., whose line supplies about 100 miles of the route.

Trade Literature

General Electric Catalog No. 6001. General Electric Co., Schenectady, N. Y. Pp. 1338; 8 x 10 in.; illustrated. General catalog of all products of this company for year 1921. This book contains a wealth of information.

Association Activities

New River Operators' Association

S. A. Scott, in charge of the operations of the New River Company in the Fayette and Raleigh fields, was chosen to succeed himself as president of the New River Operators Association at the annual meeting of the association held at White Sulphur Springs. T. L. Lewis was once again chosen as secretary of the association. Mr. Lewis was at one time president of the international organization of the United Mine Workers of America, succeeding the late John Mitchell in that capacity. His headquarters are at Charleston. After members of the association had completed a review of the year's activities and the usual annual reports had been submitted, they enjoyed a banquet at which C. W. Dillon, of Fayetteville, was the toastmaster.

Northern West Virginia Coal Operators' Association

Representatives of the association held a conference late in December on car supply and other transportation questions with Daniel Willard, president of the B. & O., and other executives of the road. Secretary George S. Bracket, speaking for the association, pointed out that the business of the coal producer on the line of the B. & O. has suffered, that the tonnage of northern West Virginia is not claiming its share of the national production and that the road is not maintaining its share of the traffic within northern West Virginia territory. Mr. Bracket also pointed out that shippers on the Baltimore & Ohio never had had reasonably constant service and had never been able to go into the market and sell their coal and offer to their customers this essential factor in the industry. The association asked for adequate car service. In replying to the complaint of the operators, Mr. Willard said that the road was having a number of cars repaired and that with those purchased there would be available by April 1 about 12,000 empties. He thought an excellent plan would be to have a special committee of the association appointed to confer with officials of the road in northern West Virginia.

Chicago Wholesale Coal Shipper's Association

The annual meeting of the association was held at the Great Northern Hotel Jan. 3. After luncheon the officers and the chairmen of special committees reported the activities of the association during the last year. The following officers and directors were elected to serve during the ensuing year: President, Wm. C. Hill; vice-president, Chas. M. Moderwell; secretary, Geo. H. Merryweather; treasurer, Geo. S. Wood; directors, Chas. L. Dering, Lewis Overholt, Thos. C. Irwin, Fred A. Brahm, Chas. E. Hostler, Leon Romanski and Roscoe B. Starek.

Clarksburg Coal Club

At the last meeting of the Clarksburg Coal Club at the Waldo Hotel, at Clarksburg, W. Va., car shortage, the labor situation and general conditions in the industry were the topics of discussion. The club also discussed the proposed visit of Vice President C. W. Galloway and other officials of the Baltimore & Ohio to the region. It was the consensus of opinion among those at the meeting that the car shortage is worse now than at any time in recent months, as some mines have only 15 per cent or 20 per cent car supply, although the assigned car supply is good.

Coming Meetings

American Engineering Council will hold its annual meeting Jan. 11 and 12 at the headquarters of the Federated American Engineering Societies, 24 Jackson Place, Washington, D. C.

Northeast Kentucky Coal Association will hold its annual meeting Jan. 23, 1923, at the Ventura Hotel, Ashland, Ky. Secretary, C. J. Neekamp, Ashland, Ky.

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

Engineers' Society of Western Pennsylvania will hold its annual banquet Monday evening, Jan. 22, 1923, at Pittsburgh, Pa. Secretary, K. F. Treschow, Pittsburgh, Pa.

Hazard Coal Operators' Exchange will meet on Jan. 12, 1923, at the Phoenix Hotel, Lexington, Ky. Secretary, R. A. Hord, Lexington, Ky.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, THURSDAY, JANUARY 18, 1923 Number 3

Looking Ahead in the Light of What Happened in 1922

Bituminous Coal Production Approximately That of Preceding Year, Though Output of Manufactures Is 50 Per Cent Greater—Substitution and Conservation Foreshadow Smaller Base for Soft-Coal Industry

WHAT happened in 1922 in the coal industry is of chief interest now in helping us to look ahead into 1923. The first fact to be faced is that production of bituminous coal was approximately as great in 1922 (407,000,000 tons) as in 1921 (415,000,000 tons) and making allowance for net changes in consumers' stocks and for exports, it appears from the preliminary figures that 400,000,000 net tons of bituminous coal was consumed in 1922, as compared with 392,000,000 tons in 1921. The difference is small.

On the other hand, the production of manufactured commodities in 1922 was about 50 per cent over 1921, according to the Department of Commerce. Textiles, iron and steel, non-ferrous metals, petroleum, paper, rubber, automobiles, building construction, lumber, brick, cement, leather, sugar, meats and agricultural receipts each recorded gains in the past year of from 5 to 70 per cent over 1921. The railroads originated approximately as many carloads of freight in 1922 as in 1921, despite the loss of some 40,000,000 net tons of anthracite production and several million tons of soft coal.

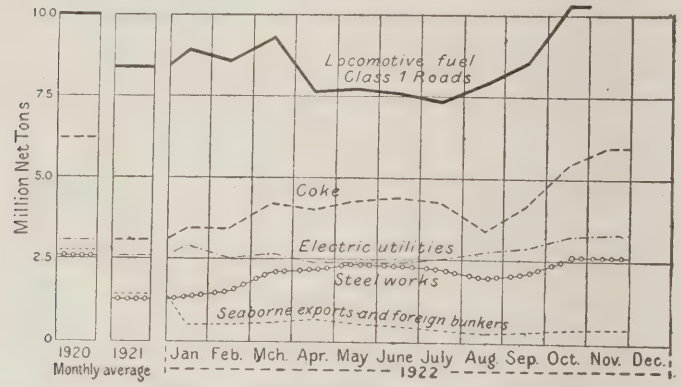
The answer to how the country could do more business requiring fuel and power and use little or no more coal is found in several directions, none of which can be evaluated with precision at this time. Householders' requirements, as measured by deliveries to retail coal dealers, were substantially lower in 1922 than in 1921. Mild weather is only partly responsible for this: probably as important is the fact that retail dealers took in much less than normal tonnages of bituminous coal during the summer months, when the strike was on. This and the partial lack of hard coal accounts for the avid demand from domestic users and retail dealers that characterizes the market at the close of 1922.

In other directions, among the heavy coal-consuming industries the greater production with less coal consumed is attributed to substitution and conservation, both the direct result of high prices and, since April 1, the difficulty of obtaining supplies. There is in progress a continually greater utilization of water power that makes for greater industrial output with corresponding replacement of coal. This has continued through 1922. There was a 9-per cent increase in crude-oil consumption in 1922 over 1921, accompanied by a 20-per cent decline in price. Fuel-oil consumption doubtless gained even more, as is indicated by a 13-per cent increase in imports of Mexican crude, chiefly valuable as fuel. More fuel oil means less coal. New England, the Atlantic seaboard, the Gulf region and the Southwest are the areas of greatest use of fuel oil. Greater use of these substitutes will account for not less than 10 per cent of the coal that was not used.

Better utilization helps account for more results on less coal, for more production of manufactured products with less production of coal. The railroads, for instance, made their coal do approximately 8 per cent more work in ton-miles of freight handled in 1922 than in 1920 and about 3 per cent more than in 1921. The revolution in coal utilization that has been going on for a number of years is concerned with the development of central-station plants. These producers of power attain the maximum of horsepower from coal in their large modern plants. Year by year they have been taking over the power load for industry. Thousands of isolated plants maintained by industrials before the war have been laid idle and power purchased from central stations. The result is a gain in horsepower hours with the same tonnage of coal. The total consumption of coal by central stations is gradually increasing—they also have the largest developed water power plants—but the output of the former is gaining at even a more rapid rate. Furthermore, every ton of coal sold over power wires replaced more than a ton of coal in some smaller, less modern steam plants. The net result of more power from less coal cannot be measured in exact figures but it is an important factor.

If instead of tons of coal produced there were records of utilizable heat units shipped, the records of output would be different from what they are. Beyond question the tons of coal produced in such boom years as 1917, 1918 and 1920 contained more slate and ash in other forms than that produced in 1919 and 1921. When the buyer is free to choose, the best coals only, generally speaking, are produced. Pool 18 disappeared from the market in 1921; pools 9 and 10 gained. It so happens that the coal fields that are non-union and that worked during the strike in 1922 furnish among the highest grade coals in the country. Despite the threatening shortage throughout 1922 there were few periods when the lower grade coals were brought into the market. While not as clean as in 1921, the coal produced in 1922 was better than that produced in 1920. The tonnage shipped in 1920 that was not coal may have been anything up to 20,000,000 tons. Quality of coal produced is then a factor in making up the tons of total consumption.

Looking ahead into 1923—a year which observers generally, in their best New Year's vein, agree is to



Coal Produced in the United States, by Groups of States, 1916-1922

be one of continually expanding prosperity—the soft-coal industry must reckon on a new and smaller base.

Two years ago it was considered that 550,000,000 tons of bituminous coal represented a normal requirement for the country. That figure plainly is 100,000,000 tons too high for the present. It has been argued that the consumption of coal is inelastic; that it is fixed by conditions entirely outside the coal industry itself. In the humdrum days before the war, when price varied

THE TREND OF COAL CONSUMPTION

from season to season a few cents a ton at most, and a jump of 50c. over night was unheard of, perhaps consumption was inelastic. But it is not so now. Consumption has contracted, relative to the power-producing and heat-requiring needs of the country. High prices and uncertainty of supply have driven consumers to substitution of oil, water power, tar, and coke breeze, and the purchase of more economically produced central-station power.

Just as one result of the strike of 1922 will be the permanent loss of some of the old-time trade of the hard-coal producers—lost because consumers have been driven to substitutes that they find satisfactory in view of the price differential—so has the bituminous-coal industry in the past four years lost trade.

How some of the more important consumers used coal in 1922 is illustrated in the accompanying diagram giving the monthly consumption of bituminous coal in tons last year as compared with averages for 1920 and 1921. The drop in consumption of locomotive fuel from April to August was notable. Decreased tonnage of coal during the strike is largely responsible for the falling off in this item. Coke held up very well until August and made remarkable improvement in the last quarter. Consumption of coal by electric utilities was above 1921 but below 1920, until toward the end of the year. Steel works made gains in consumption throughout the first half, but slumped in July, August and September. Seaborne exports and foreign ship bunkers were low throughout the year. This diagram, compiled by W. F. McKenney, of the U. S. Geological Survey, does not cover the consumption of coal by industrial plants or distribution by retail dealers, two important items. All the available evidence indicates that the gradual business recovery of 1922 has gained speed since the strike ended. Consumption by the consumers represented in the diagram has increased sharply since that time, and the most recent reports show that of the five known items only exports and foreign bunker coal have failed to reach the monthly average in 1920.

How production varied through the year in each state is shown in the following table.

Production of Bituminous Coal by Months, 1922*

	January	February	March	April	May	June	July	August	September	October	November	Year to Nov. 30

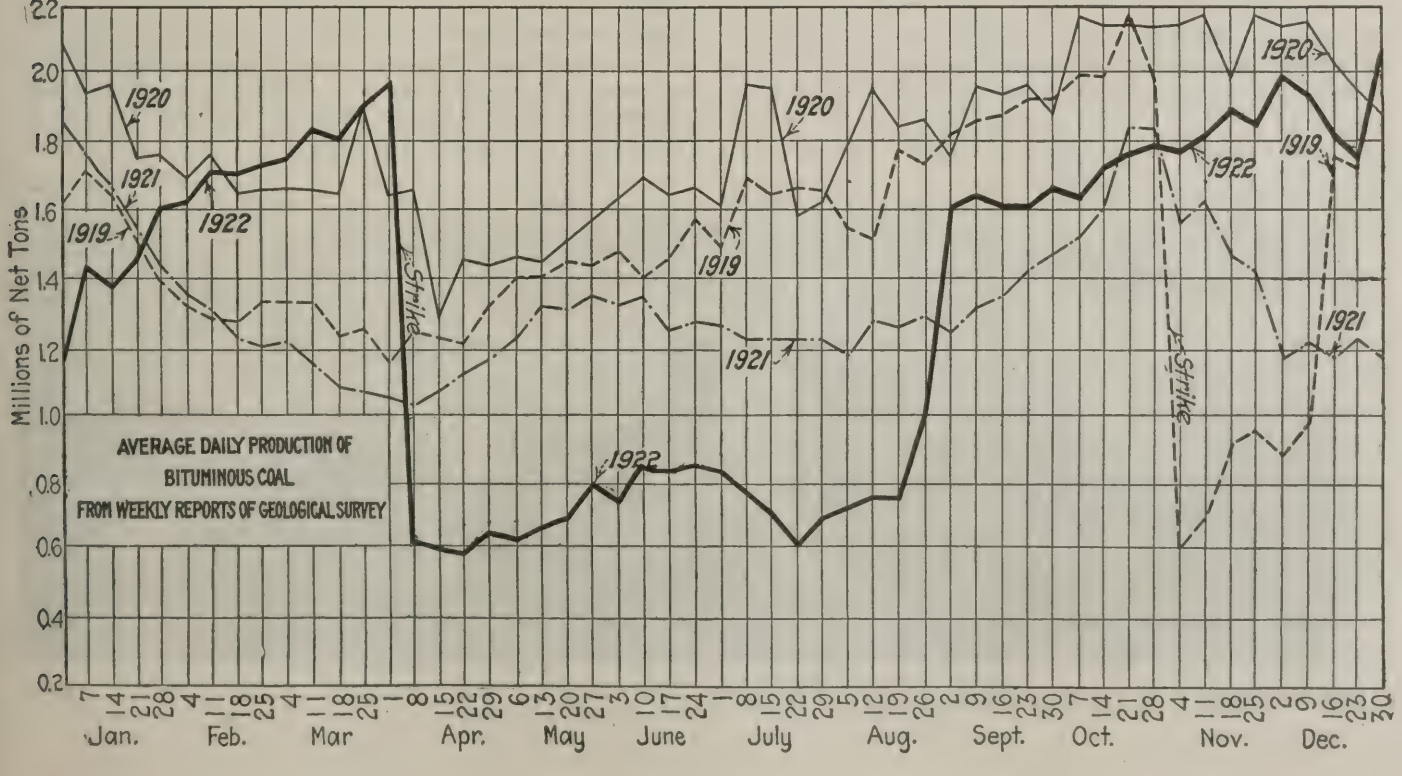
Course of Coal Prices in 1922 Markedly Irregular

Market Vagaries Accentuated by Strike, Relatively Limited Demand and Restraining Influence of Operators and Government—Anthracite Shortage Causes Sharp Upturn in Quotations—Forecasts Vary Widely



SPOT prices ran an irregular course in 1922. The vagaries of the market were accentuated by the strike, the relative smallness of the total demand and the voluntary repression on prices exercised by the operators and the government during several months of the strike period. The steady decline in the market that characterized 1921, when from January to December the spot market dropped $1 and the *Coal Age* Index from 270 to 187, continued through the first quarter of 1922. Demand was strong in the pre-strike months but the offerings overtopped the market. Little car shortage was reported and buyers had no difficulty in building up huge reserves.

Immediately after April 1 the market became firm and gradually stiffened. It was not until late in May, however, that prices threatened to get out of hand. Strikes in the non-union fields of Pennsylvania left the iron and steel industry with an unsatisfied demand. They had not made the preparations for a shutdown of the mines as had other consumers, and when their mines were largely closed they went into the market for large tonnages. They bought carefully but the effect was to bolster the market, in fact it seems likely that had the iron and steel industry not been forced into the market when they were the Southern fields would have had some difficulty until later in the summer in finding a market for their huge tonnages.

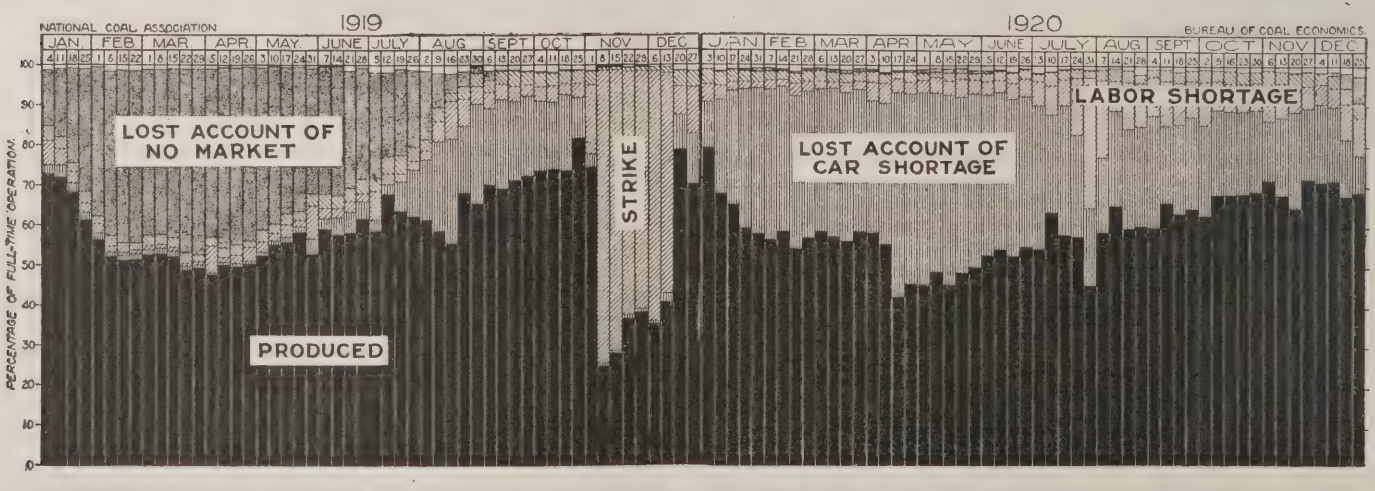
In the last half of May the government, through the Secretary of Commerce, effected a working agreement with the operators in the South by which prices on a majority of the tonnage were held down to levels considered reasonable as compared with the prices fixed during the war. These informal agreements with Mr. Hoover did not have the effect of reducing prices, for the action was taken while the market was actively climbing and before the levels set had been reached. The result was a temporary staying of the ascent. Two fields, western Kentucky and eastern Kentucky, did not immediately enter into an understanding with the government. These are the only fields in which the average spot price in July was higher than in August; in all others that produced even in part during the summer the maximum prices were not reached until August. In August, following the strike, the voluntary price agreements were abandoned.

After the settlement was reached in Clevelend, in the middle of August, and the union mines returned to work the market was nearly two weeks finding a level. In several fields there was a small gain in prices in the last half of that month, in others the peak was recorded at once. Production was quickly attained and by the first of September spot prices were at the post-strike peak. Every precedent pointed to a continuation at this level and even further gains in the market. Stocks were depleted, the winter was approaching, the condition of the railroads indicated that production could not be raised to such high levels as in 1918 or in 1920, when 12,000,000 tons a week was common and 13,000,000 tons passed several times.

Here again Mr. Hoover stepped in, this time acting with the buyers and consumers. Through the United States Chamber of Commerce and the many affiliated organizations representing coal purchasers of magnitude, he appealed for sanity in handling the situation. Buying only to meet current requirements was urged. Purchasing agents for industrials, steel mills and railroads took up the idea. Prices began to decline. Production held up, even gained and, after reaching 11,000,-

RELATIVE SPOT PRICES OF ANTHRACITE

This shows the weighted average price of anthracite by months, including all sizes of both company and independent production. It is compiled from *Coal Age* quotations and the base of 100 is the average for the year ended June, 1914.



000 tons per week, was maintained on that level until the holiday season at the end of the year.

During this period prices declined steadily, until real winter weather in the middle of December brought forth another factor theretofore dormant—the shortage of anthracite. Approximately 40,000,000 net tons represents the difference between the 1921 and 1922 production figures for hard coal. When the hard-coal miners went back to work Sept. 1 the general public that depends on hard coal to keep warm in the winter settled down with a huge sigh of satisfaction. They expected that now they would have their coal. Nothing that was said by public officials seemed to stir them to action in stocking substitutes and retail dealers were lacking in incentive to fill their yards in anticipation of the demand that followed. When zero weather did hit the East the demand for all kinds of household fuel became sharp and there was and still is a scramble for suitable substitutes for the domestic sizes of anthracite. Mainly as a result of this large increment to the demand and in part because production declined in the last half of December, while consumption was increasing, prices took a sharp upward turn, regaining in part the ground lost during September, October and November. The largest gains were in the East, where there is the greatest demand for substitutes for hard coal.

Opinion on the course of the market in 1923 ranges widely, from forecasts to the effect that not only will this year see continued high prices but that the same situation will prevail for several years to come to the more conservative belief that once the question of a strike in the soft-coal fields this year has been settled, either pro or con, and the sharp edge of winter is off, the market will settle down to a long down pull.

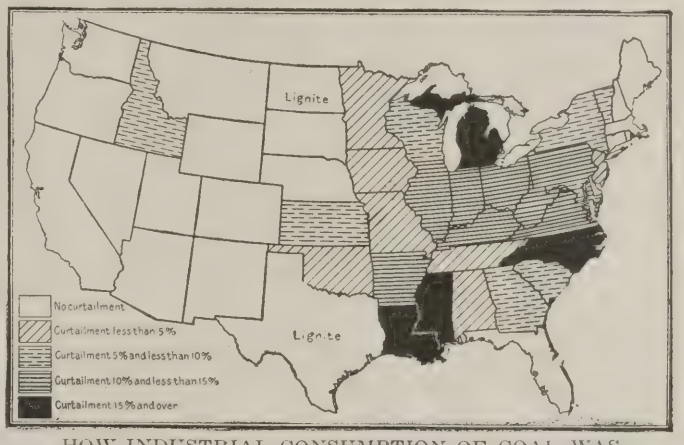
It seems reasonably clear that negotiations between the miners and operators looking toward a new contract are going to be long drawn out. The demand for coal will be good throughout the first quarter of this year. Stocks will be accumulated by consumers though not so large as last year. Then, whether there be a strike or not, demand after April 1 will fall off and the market drop. The extent of the expected decline in demand and prices after April 1 in the event of a strike will depend on the severity of the strike. If the Connellsville and other non-union fields in Pennsylvania are not affected the result will be quite different than if they again are hard hit. Should the old Central Competitive Field, even in part, reach an agreement and continue at work, and some of the outliers, as central Pennsylvania, come to grips over their local situation—and their disinclination to join in a national conference appears to be predicated on the desire to straighten out their particular affairs with the union—the market would be stronger by that much than if they continue.

Looking ahead to the fall and winter of 1923, all that can be said is that contingent always on the attainment of some form of settlement of economic affairs in Europe that does not deprive this country of a market abroad, the demand for coal will be strong inversely as the production this summer is low. That is to say, barring a setback in the industrial recovery now definitely under way, which setback can be most effectively accomplished if Europe does not come to terms within itself, the consumption of coal in this country in 1923 will necessarily be greater than in 1921 or in 1922. If a fair normal share of that coal is not bought, produced and delivered during the summer, whether the lack be because of strikes or apathy of buyers, the market will be strong next autumn and winter.

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES OF ALL BITUMINOUS COAL MINES IN UNITED STATES, 1919 AND 1920

Factors Limiting Production of Bituminous Coal

Lost Time in Earlier Months, Preceding Strike, Principally Due to "No Market"—Post-Strike Losses Almost Wholly Attributable to "Car Shortage"—Curtailment from Both Causes Nearly Equal

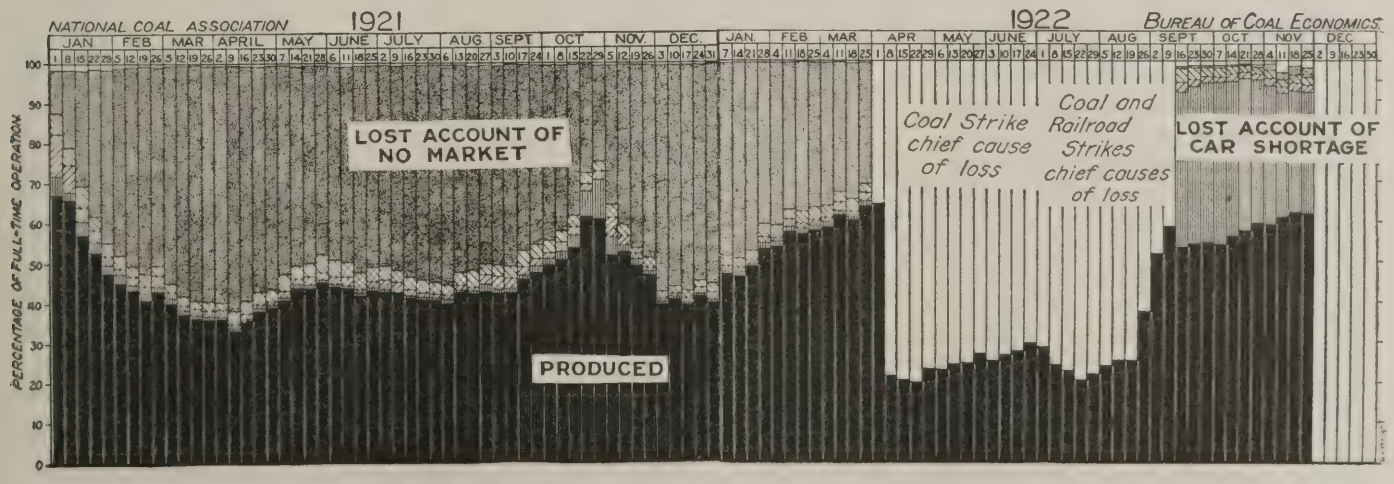


A COMPARISON of the *Coal Age* Index of spot prices and the diagrams of time worked and lost at the soft-coal mines, as shown in this issue, illustrates the difference between "no market" and "car shortage" as factors limiting the production of bituminous coal. Production in February and March was approximately equal to that in October and November, progressing upward in each of these two-month periods, one prior to the strike, the other afterward. In February and March the average daily production ranged from 1,600,000 tons to nearly 2,000,000 tons. The price was dropping throughout the period, the decline being slight, however, the index dropping from 182 to 170. The operators reporting to the Geological Survey attributed practically all of their lost time to lack of market.

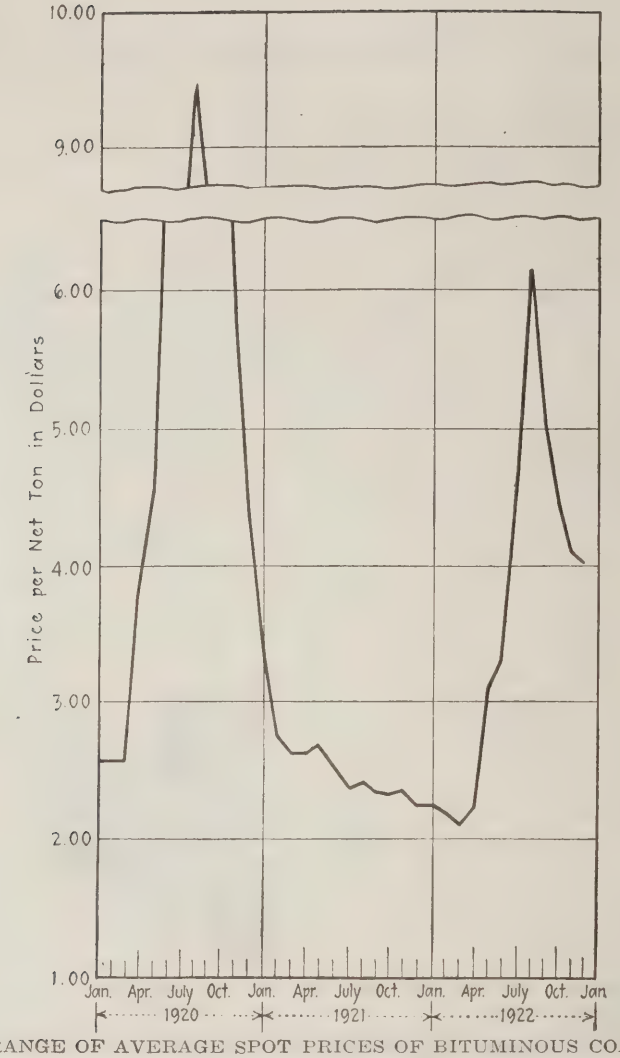
Then, following the strike, after production had been resumed, the price index, standing at 404 the first week of October, declined to 330 the last week of November, while the average daily rate of production rose from about 1,600,000 tons to 1,900,000 tons. Here we had two periods with almost identical rates of production—in the first, the market limiting the rate of production; in the second, "car shortage" being charged with the lack of output.

In the earlier months there was less anxiety on the part of buyers and less bidding for coal—fewer mines were producing and calling on the railroads for cars. The mines that were in operation were satisfied that had they called for more cars they could have obtained them, for they charged up their main losses in working time to lack of market. It was a buyers' market in February and March. By the time the long strike was settled, stocks were low, winter was in prospect and buyers more avid for supplies. It had become a sellers' market and with orders in excess of current ability to produce and ship, the producer charged up his main loss of time to "car shortage."

The individual district records in this respect are interesting. They are shown graphically in the Market Review Section of this issue, as compiled by the Bureau of Coal Economics of the National Coal Association, in part from unofficial records and in part from the weekly reports of the U. S. Geological Survey. The more important fields in which there was a total suspension of operation during the strike—Illinois, Indiana, Ohio and Pittsburgh—and those, as central Pennsylvania, Fairmont, Kansas and Kanawha, nearly but not entirely closed down, best illustrate the sharp change from market to transportation as factors limiting production.



The records for Cumberland-Piedmont, New River,



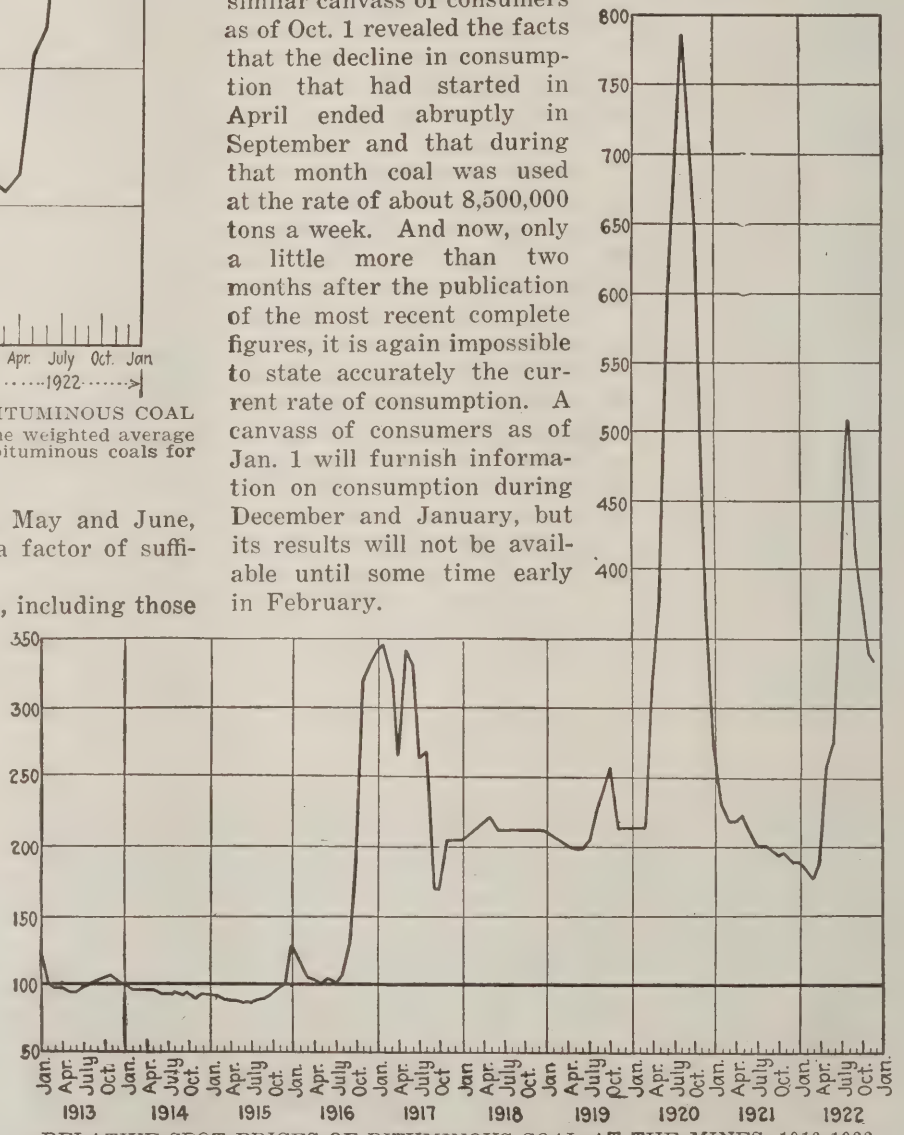
HOW INDUSTRIAL CONSUMPTION OF COAL WAS CURTAILED BY THE STRIKE

This diagram, based on data collected by the United States Geological Survey shows when and to what extent industrial consumers curtailed operations and the consumption of coal during the later months of the strike of 1922.

Somerset County and the West Virginia Panhandle show the usual period of "no market" in the first quarter, followed by partial cessation of operations in April 1, and the transition of "strike" to "car shortage" as factors limiting production in the period beginning with April and ended with December. These districts

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES OF ALL BITUMINOUS COAL MINES IN UNITED STATES, 1921 AND 1922

RANGE OF AVERAGE SPOT PRICES OF BITUMINOUS COAL



This diagram shows the monthly range of the weighted average spot price (f.o.b. mines) of 14 representative bituminous coals for the three years 1920-1922.

also record the short period in April, May and June, during which lack of market was yet a factor of sufficient importance to record.

There is another large group of fields, including those in southern West Virginia, Logan, Kenova-Thacker, Pocahontas, Tug River and Winding Gulf, those in eastern Kentucky, including Hazard, Harlan and northeastern Kentucky, all non-union, and western Kentucky, a union field, that recorded remarkable spurts in production in April, May and June. New high records in output were established in this quarter. These fields had ample car supply and with continuing impetus to the market as the strike in the union areas continued on into the summer, full advantage was taken of the opportunity to run. The shopmen's strike, directed primarily at roads originating coal in these fields, began on July 1, and by the second week had crippled the roads. Car shortage soon became a limiting factor, production dropped and by the time the strike was settled and the union mines began to order cars, production had slumped. The last quarter of the year was a period of short-time operation for these fields.

Virginia recorded a year of this character, with the car supply depleted in the last half, but better than in the other non-union fields to the immediate north and west. Alabama and Westmoreland did much better than the average non-union fields. There were some strike losses in Westmoreland in the second and third quarters and, compared with most other fields, a mild car shortage in the last quarter. Alabama found lack of market the largest single factor limiting production until the second half of August. From then on car shortage was the more important.

A canvass of coal consumers on March 1 indicated that during January and February, 1922, coal was consumed at the rate of about 8,100,000 tons a week. After the results of that canvass had been published, on the day the strike was called, there was no further complete information until a month after mining had been resumed. During that period of six months any estimate of the rate of consumption that may have been published necessarily included much guesswork. A similar canvass of consumers as of Oct. 1 revealed the facts that the decline in consumption that had started in April ended abruptly in September and that during that month coal was used at the rate of about 8,500,000 tons a week. And now, only a little more than two months after the publication of the most recent complete figures, it is again impossible to state accurately the current rate of consumption. A canvass of consumers as of Jan. 1 will furnish information on consumption during December and January, but its results will not be available until some time early in February.

RELATIVE SPOT PRICES OF BITUMINOUS COAL AT THE MINES, 1913-1922

This diagram shows the relative prices, not the actual prices, shown in succeeding diagrams in this issue of *Coal Age* for particular coals. Prices for fourteen coals, representative of nearly 90 per cent of the total output of the United States, were weighted in accordance, first, with respect to the proportions of each of slack, prepared and run-of-mine normally shipped and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the Report on *Prices of Coal and Coke, 1913-1918*, published by the Geological Survey and the War Industries Board. The result is a series of index numbers.

Year 1922 Tackles Hopefully Many of the Big Problems Of Coal Production and Preparation

Loading Machines Halting Before Room-and-Pillar System—Rotary Dumps Makes Big Car Feasible and Big Car in Turn Solves Some of Our Loading Problems—Coal Crops Being Stripped—Germans Reinvent Cement Gun

By R. Dawson Hall*
New York City

IMPORTANT as are haulage, hoisting, pumping, and preparation at the mines, the leading problems are in the operations at the coal face—undercutting, drilling and loading. These three are more adversely affected than any other by the room-and-pillar method. The area to be undercut, drilled and loaded at the end of any room may be only 5x12 ft. and at most is 10x40 ft. If it could be staked out on the surface into a small farm and if all the other similar areas were likewise staked and if lanes were run up to the various farms from a common roadway at right angles thereto, one would have an idea how lacking in concentration such operation is, for work on the surface is never done in this manner. The farmer, being asked to plough, drill, and cultivate such trifling areas, would remark that if he could not have his farm in one or two places he would just as soon have none at all.

The difficulty of operation with such distances between operating points has made clamorous the present demand for longwall, sidewall or some other method of operation which would give some, at least, of the desired concentration. It is true the undercutter in a degree has managed to fit himself into the room-and-pillar system, and that there are not lacking some who are disposed to demand that the drill and loader shall be made to conform also to its requirements.

Must All Machines Come to It?

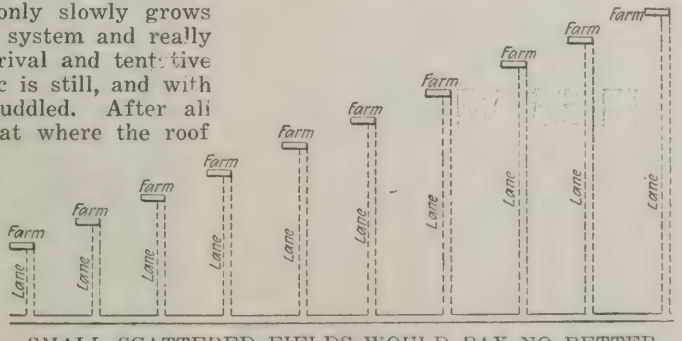
It is said that the cutting machine has settled itself down to room-and-pillar work and that other machines must do the same. But cutting is reasonably efficient under that system. The full face can be cut at one time, be it 12 or 40 ft. wide, but the loading machine must load the cars one by one. So in a room-and-pillar face the machine is continually waiting. That is true even when every care is taken by the management to supply cars frequently. It is an inherent fault of the shuttle method of supplying cars.

The problem undoubtedly will be solved before long, but before that time something like a revolution is needed not only in operating methods, but in the compensation of the mine worker. The new machines should afford him a larger wage than he would receive when working by less efficient methods, but he is so doubtful whether such profit will result that it is likely that the operator will have to pay his miners entirely by the day or forego the advantages of loading machinery unless indeed he is operating in non-union territory.

When, however, it is solved it will be found that what is now regarded as a large tonnage for a single mine can be produced from nine or ten longwall faces. In the year just past a loader of the American Coal Loading Corporation in 3½ hours of broken time actually loaded 267 tons, the average loading rate per hour being 76.3 tons. This is considerably over one ton per minute of actual working time.

Unfortunately it is a heavy machine, requiring so much space that it seems to be suited only to those mines having a good roof and a hard floor. It is probable at least that mines thus favored will be the first to use loading machines exclusively and as a standard practice, but as confidence is established their use may be extended to mines less favorably circumstanced. The value of concentration, however, is quite important as far as haulage problems are concerned. Nothing is more wasteful than the gathering and coupling of cars. With a proper system there will be only one class of locomotives in the mine—namely, the main-line type designed for the hauling of full trips of cars.

Several attempts are being made to develop short or extensive longwall faces suited to loading machines or face conveyors, the aim being to obtain a long face without the cost and labor of packwalling, brushing and bottom lifting that is incident to longwall systems such as are usually employed in the mines of Europe and in those of Illinois, Iowa, and the anthracite region of Pennsylvania. Progress has not been rapid. The public only slowly grows to appreciate a new system and really there are so many rival and tentative plans that the public is still, and with reason, a little befuddled. After all it is quite likely that where the roof and floor are good the plans adopted will be entirely different from what they are when top and bottom are bad, and different yet again when the coal is thin from what they are when the coal is thick.



Interesting also is the way in which the scraper loader is being developed. New efficiency is being sought by making the haulage engine, the drag plane and its chute portable, by taking the ropes and the sheaves off the heading and by illuminating the scraper with a searchlight mounted on the hoist.

In gathering storage-battery locomotive service, units have been developed that will pass under an ordinary four legged table. The storage-battery locomotive is an economy wherever it is kept busy. It is profitable in thick and thin coal measures, but its value is most evident in thin coal. The lower the room into which it can travel the surer it is to keep the mule out. With such vertical clearances for locomotives as have now been developed it would be extremely expensive to dispense with the locomotive and rip top or lift bottom to provide room for a mule.

Rotary Dump Modifies Cars

The rotary dump is having an interesting effect on the mine car. The front end of the wagon being strengthened by the absence of the gate it has been possible to make the flare of the car flatter and yet build the car wider than ever before. The wheels now run in housings in the car bottom. This has been possible for two reasons. One is that the car is now so stiff that it is protected against any deformation that would make it drag on the wheels and the other is that the bottom of a car to be discharged on a rotary dump does not have to be flat for the coal to slide out of it.

Now that the coal is slid out at the top the shape of the bottom of the car is a minor matter, in fact gusset plates

SMALL SCATTERED FIELDS WOULD PAY NO BETTER THAN MANY SHORT, UNCONNECTED MINE FACES

By making an analogy between a farm and a mine the reader can see perhaps how distressingly uneconomical are the operations in our coal workings. These ten small fields up ten long lanes approached by a lengthy highroad would breed desperation in a farmer.

*Engineering Editor, *Coal Age*.

AUTOMOTIVE SCRAPER HOIST, DRAG PLANE AND CHUTE

Long ropes constrained to follow certain lines by pulleys have cumbered the roadways under the scraper system. This is all saved by the new method which puts the hoist at the mouth of the room and enables it to move under its own power from neck to neck or, in longwall, from loading point to loading point.

are being used to stiffen the sides so that their full length will be supported and protected. Just how far this will go is doubtful, but with a rotary dump any plates needed to give the required strength can be introduced, though coal thrown on their edges is almost sure to be broken and vacuities are likely to be formed in the contents, thus lowering the working capacity of the car.

The room-and-pillar method so hampers loading that the large car is in ever greater demand. Such a car when placed at the face will give a loading machine several times as long a service as a small car. To carry the matter to an absurd extreme, suppose railroad cars could be used. Then the loading machine would need only to have cars placed ten times a day and three men loading by hand would find one car more than a day's supply. This would almost eliminate waits altogether. Rooms could be made longer without the increased length of the waiting time consequent thereon having an appreciable affect on the tonnage. Such a car would be unthinkable in any but in such mines as those at Hanna, Castle Gate or Hiawatha, and men could scarcely load them at all, as the casting would be too high and over too long a distance. Nevertheless the illustration though forced—perhaps just because it is forced—shows clearly one big advantage that the large car enjoys.

Big Car, Low Gathering Cost

Furthermore, by the use of a large car gathering is relieved of its greatest problem—length of travel. With a big car a mine locomotive in one trip moves seven or eight tons instead of one and cuts the gathering cost to about one-seventh. Roller bearings and better tracks have made the large car more easy running. Braking on the locomotive instead of by sprags in car wheels has made the tractive resistance of mine cars lower than ever. Rotary dumps have made the handling of mine cars easier. For these reasons big cars are likely to become more general in the thicker beds of this country, and in fact experiments are being made to design a car that will hold eight tons for use in the thick beds of the southern Illinois fields, specifically at the mines of the Chicago, Wilmington & Franklin Coal Co.

This change solves in part the problem of the room-and-pillar system in some mines—those having thick coal—but what is best suited to the room-and-pillar system will serve well also in longwall or sidewall should the car be used in such places. In fact the large car comes in time to meet the needs of mechanical loading, in whatever manner that loading may be performed.

Reverting, however, to the solid-end car it is interesting to note that just at the time that the rotary dump was introduced into America, and the solid-end car accordingly became feasible, the bottom-dump car (that hitherto dumped so readily that it could not overcome the habit but discharged anywhere between the face and the tipple) was so much improved that it began re-establishing itself in public confidence. It has a great advantage in that it will dump a whole trip on a cheaply constructed dump without any delay for uncoupling. It has, however, an unhealthy past to live down.

In connection with rotary dumps it may be added that, according to H. A. Turner, the H. C. Frick Coke Co. is expecting to install two Ramsay dumps each of which will handle thirty-five cars at one time. The dump will be nearly 400 ft. long and will be underground. The dumping operation will occupy only about ten seconds.

The Coverdale mine, and that of the Monroe Coal Co., at Revloc, Pa., have introduced a new idea in hoisting, two cars being raised side by side in the same cage, not in tandem nor one above the other but flank to flank. With the cars in tandem they must be removed from the cage for unloading. With cars on different decks the difficulties are many, so many, in fact, that not much attempt has been made to meet them. With cars side by side, self-dumping cages can be used. Ingenious indeed is the way in which cars in single file are caged side by side and after raising, dumping and lowering are again discharged side by side to be maneuvered into single file again.

Give Dirt Time to Settle

In the past year coal preparation has made some advances. In the anthracite region, for example, the James jig has been successfully treating fine coals, the secret of its success lying in the absence of suction. Owing to this quality the coal being washed has an opportunity to segregate. It is all very well to stir up the mine product in water, but some opportunity to settle is needed if the light and heavy are to be parted satisfactorily. The James jigs also have been developed so that they will prepare coal up to, and including, broken. In fact they expect soon to be handling lump coal also. A vibratory screen is being tried out by the Hardinge Co.

The Chance separator is making progress in the anthracite region, and in the soft-coal field something on a large and practical scale should be heard about the air or dry concentrator, a large installation being built by the American Coal Co. of Allegany County at the Crane Creek Mine.

Abroad the Draper and Rheolaveur

RELOADING COAL FROM STOCKPILE BY UNDERGROUND LOADER

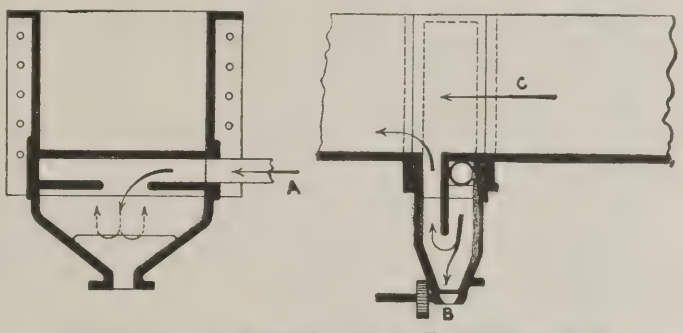
The photograph from which this illustration was made was taken a few years back at Montour No. 10. For some doubtless good reason only one track was laid so that the machine is in the same disadvantageous position in which it would be if loading at the end of a room.

washers, both original applications of time-honored washing principles, are arousing much interest. Flotation is still being actively pushed as a means of treating coal and in some mines the coal thus floated is briquetted economically by a new process. In this county the Trent process is making headway, and Lindon W. Bates, who had been in England installing a plant to manufacture colloidal fuel, has now returned to this country.

In the stripping field activity in outcrop work has been reported around Osceola Mills, where miles of coal crops are to be found. It has been found by some coal men that if coal from the crop is crushed new black faces are exposed which not only fit the coal for steam uses but give the purchaser a more favorable impression of the product. The rust of outcrop coal is along developed fractures and does not extend into the heart of the lump. Crop coal has the advantage of being less disposed to coke on the grate.

In the extreme south of Alabama, in Escambia County, at the Alco mine, near the Florida line, hydraulicking is to be used to remove the overburden from above a coal bed. That method has not been practiced, I believe, since it was used in the Danville region of southern Illinois. It proved successful there but opportunities for its operation, of course, are somewhat limited. It has been used also for stripping iron ore in the Cayuna range of Minnesota.

Now Motors Are Absence-Proof



Notable among the achievements of the year has been the advance in the use of automatic electrical equipment. Nothing adapts itself better to remote control and automaticity than electricity, yet only recently has that fact been realized and taken advantage of in mining. At first the attempt was made, not with the approval of the manufacturer of course, to leave some machinery without manual control and with only a circuit breaker or even only fuses to protect it, but now the most elaborate of mechanical and electrical precautions are being taken to protect machinery, and where they have been installed the authorities at the mines regard automatic as safer and more expert than manual control.

At the Red Star Mine in West Virgina arrangements are provided so that if much power is desired, two motor-generator sets are put in operation, but if only one is needed the automatic electric apparatus shuts down one of them. The busiest time around the mine is the early morning and that is when much of the electric machinery has to be put in operation. Today, in consequence of the introduction of automatic devices, machinery can be safely started by remote control, and hence much of the most valuable part of the day is saved to the man who has the operation of the electric machinery in his charge.

One wonders whether the time will not come when the man who runs a locomotive or even a medium-sized hoist will be afforded opportunity merely to start the sequence of actions by which full power is developed or shut off, instead of being able to throw the controller handle with utter disregard of all the rules of proper operation. This provision is already embodied in electric railroad operation. Why should the motorman have it in his power to "goose" a motor?

If we had electricians to handle electrical machinery the present equipment might be properly used, but with machines started by motormen, machine men, ditch diggers, pumpers and hoistmen little latitude of choice should be allowed. It is to be hoped that within the space available on the locomotive, mining machine and loader some means will ultimately be found to put devices which will prevent the motorman, cutter and loader, respectively from abusing their motors. The pump and the hoist also should be protected by automatic devices, even where not operated from a distance.

Coal storage is increasing at the coal mines. It is beginning to be realized that while putting coal into and out of storage is expensive the coal thus put in and taken out may be a product which if not so disposed of would be otherwise holding mules, day and monthly men idle awaiting delivery of railroad cars or the repair of equipment. After the tipple has been idle an hour the coal coming to it for the next hour should be charged with double or nearly double the haulage and other operating costs.

HOW COAL IS WASHED BY THE RHEOLAVEUR

The coal is washed into the Rheolaveur through the pipe *A* and has to make a downward passage before rising through an opening into the main pipe *C*. The clean coal readily performs this aquatic feat urged on by the rush of water, but the slate on leaden feet falls down into a pocket and is drawn off by the gate *B*.

Had the coal been disposed of during that hour it surely could be handled so cheaply into and out of storage as to cost no more and probably far less than the tonnage received within the hour immediately following the shutdown, and the men would be kept in the mine and be better contended. It may be argued that the cost of delay should not be all loaded onto the coal dumped within a time equal to the period of delay but should be spread on all the coal loaded in that day. That argument looks fair enough, and indeed is fair, provided the cost of storing and reclaiming is spread also over all the day's product regardless of quantity.

If, however, it is figured on the basis of its own tonnage, then the cost of being idle should fall on an equal tonnage and not be spread any further. This fact has been overlooked and the result has been a false conclusion. Storage is a cost that is more than paid by the lowering of the average cost of the coal that is loaded that same day. The daily tonnage expense will be considerably lower than it would have been had the one-hour delay been allowed to occur. Furthermore there will be the advantage that with storage, every night "every last car" can be loaded. No cars partly loaded will be lost to next day's allotment, nor will a failure in the equipment, except such, of course, as affects the reclaiming of coal, prevent the full number of cars received from being loaded.

Many are the devices for such stocking and reclaiming; excessive mine-car supply, storage bins, derricks, shovels, locomotive cranes, conveyors, scraper loaders, dump cars and combinations of such equipment. A few serious fires have dampened the ardor of the companies in regard to coal storage but this usually can be avoided by dumping the coal into smaller piles and stocking sized coal, all fine or all coarse, the former being preferable from the point of view of economy, for the degradation of fine coal in storage does no harm. Frost is another source of difficulty.

Cement-gun work is being increasingly used not only in the United States but in Great Britain also. In Germany, according to the Department of Commerce, the cement gun has been invented all over again. The roof and ribs are covered with the cement-and-sand mixture $\frac{5}{32}$ in to $\frac{3}{4}$ in. thick. When the surface is weak and crumbly the layer is from $\frac{9}{16}$ in. to 1 in. thick.

The Germans contend that the use of the cement-sand coating gives the mine greater security against fire, enlarges haulageways by doing away with timber, improves the air by the removal of decaying wood and saves the costs of timber and maintenance, which, it is asserted, is reduced to one-fourth that of a timbered haulageway. In Upper Silesia a haulage road coated with concrete has stood for many years without timbering. A firm in New York City, the name of which is withheld, has been given the American rights to this power concrete gun. It may be a surprise to them to learn that the cement gun has been used in mining work more than a decade and was used in construction some years before.

At some mines an attempt is being made to avoid expensive surges of current by using locomotives of a speed of four miles instead of six miles per hour. It is believed that speed in gathering, while valuable, is being obtained at the cost of excessive charges for current. This belief, however, is being subjected to a practical test.

No Strike Expected April 1, Says Preliminary Report Of United States Coal Commission

The preliminary report to the President and the Congress of the United States Coal Commission was released on Monday, Jan. 15. As was expected, the report is primarily a report of progress. No final conclusions are announced, but further statements are promised at any early date. The report in full follows:

"The United States Coal Commission, as directed in the act creating it, approved Sept. 22, 1922, transmits herewith its first report.

'The commission held its first meeting on Oct. 18, 1922, within a few days after the appointment of its members by the President of the United States and less than three months prior to the making of this report. So numerous are the problems presented for our consideration by the Congress that we deemed it essential, before engaging in public hearings, to acquaint ourselves with the phases of the industry to be investigated, and for that purpose we have devoted much of our time to conferences with representative mine operators, officials of the United Mine Workers of America, wholesalers, retailers, experts on transportation and storage of coal, and committees representing the railroads and the public utilities, believing that after these conferences the public hearings could be materially shortened by being directed to the important points in controversy and avoiding collateral issues.

"An investigation of this character requires of necessity expert assistance, and the commission immediately began and has continued, as rapidly as proper persons could be found, to secure the services of a staff of experienced investigators and assistants to study and collate the undisputed underlying facts to be gleaned from reports of previous investigations and from the activities of such Federal agencies as the Geological Survey, the Bureau of Mines, Bureau of the Census, and the Federal Trade Commission, in order that it might use in its official reports all well-established and undisputed facts bearing upon the questions presented to it for consideration by the Congress of the United States. This staff is also charged with the duty of preparing questionnaires and conducting field investigations which should fully reveal, when completed, the salient facts bearing upon the various phases of the mining industry. The principal investigators are named in the appendix to this report and the character of their work is there indicated.

"When it is remembered that there are some 8,000 mines to make reports to this commission, it will be at once apparent that the queries could not be prepared, submitted and answered, and the returns analyzed or the field work completed within this short period of time. The commission is unwilling to guess about the facts, to jump at conclusions, or to make recommendations on the isolated facts which it has been enabled to accumulate since its organization. But it does report that it has found the conditions set forth in this report to exist, and that the questions arising therefrom have either been submitted as queries or will be taken up through field investigations and in public examination of witnesses.

"There is, however, so much controversy over many of the questions—especially those touching on strikes and lockouts, miners' wages, earnings of companies and upon what theory these earnings are computed, the living conditions of the miners, the competition between the different fields, whether there should be cars sufficient to supply the needs of the whole country at a peak demand, whether the miner is idle because he has no work or because he does not want to work—that the commission deems it to the best interest of the Congress of the United States not to express *prima facie* views upon these subjects, but only to give the facts and express opinions after complete investigations and deliberate thought.

The commission is unwilling to guess about the facts, to jump at conclusions, or to make recommendations on the isolated facts which it has been enabled to accumulate since its organization.

No solution of the coal problem can be found that does not recognize this community of interest between coal and transportation. But this community of interest, though simply stated, is not simple upon examination.

"The Public and Coal.—The coal problem begins with a contradiction. Rich beyond all other nations in its wealth of coal resources, the United States experiences coal shortages and high prices. The coal deposits of the country are abundant and well distributed. Coal of every variety from anthracite to lignite underlies the hills and plains and mountains in beds whose content is measured by thousands of billions of tons, so that coal of a quality and in quantity that would be regarded as important by most other nations is found in all but thirteen states of the Union, and commercial mines are being operated in twenty-nine states. Yet, with resources of coal in the ground adequate for the needs of perhaps a hundred generations of Americans, the nation's coal bin is too often depleted and too often the prices paid for coal are much higher than seem warranted by the wealth of coal available.

"There have been during the last six years three periods when shortage in the supply of coal has given rise to acute national concern. These recurring periods of scarcity have increased the cost of this basic commodity—increases especially serious to domestic consumers, railroads and public utilities. These experiences of unsatisfied demand and unsatisfactory prices have created in the popular mind a conviction that the natural benefits to be expected from a condition of plenty have been denied through artificial interference. The coal industry, therefore, has been subjected to outspoken criticism, and public dissatisfaction has expressed itself in a series of investigations and in regulatory laws. The act creating the United States Coal Commission is an expression of this feeling of public concern and dissatisfaction.

"The Coal Industry.—Every industry and every citizen throughout the country is directly or indirectly dependent upon coal. While it is true that a large majority of the states have coal mines within their limits, it is significant that all the anthracite comes from a narrow area of 480 square miles in eastern Pennsylvania and 93 per cent of the bituminous coal comes from three major areas: The Appalachian region, extending from Pennsylvania to Alabama, the greatest storehouse of high-rank coal in the world; the Eastern Interior region, comprising Illinois, Indiana and western Kentucky; and the Western Interior region, extending from Iowa to Arkansas and Oklahoma. Any map showing the distribution of the larger industrial plants of the country would in itself demonstrate the part played by these coal fields in locating the great manufacturing centers and planning the network of railroads that connect the larger commercial cities with the rich agricultural lands of the West and South. Inasmuch as more than two-thirds of the country's supply of high-grade coal lies within these three great coal areas, they may well be regarded as its chief known sources of industrial power for future centuries.

"The coal problem of the country, so far as it relates to present production, then, is largely localized in three coal regions and about a dozen States, although it is recognized that each mining district, large or small, has its problems to be investigated. In reality the coal industry includes three interrelated industries—mining, transportation and marketing.

"The coal-mining industry, in point of numbers employed, outranks any single manufacturing industry and stands next to transportation and agriculture. Approximately three quarters of a million men are employed in this industry, of whom 90 per cent work underground.

"The capital invested, according to the rough figures of the census, is $2,330,000,000, of which $430,000,000 is invested in the anthracite region and the remainder in the bituminous fields.

There are only 174 producers of anthracite and 8 of these control over 70 per cent of the annual output, while there are at least 6,000 commercial producers of soft coal, to say nothing of thousands of wagon mines and country coal banks. These producers operate 9,000 commercial mines.

"While the anthracite and bituminous branches of the coal industry are to some degree competitive in their markets, the differences in their mining, labor and economic problems are so marked that the discussion in this report will be limited to bituminous coal except where anthracite is specifically mentioned; the law requires a 'separate report on the anthracite industry on or before July 1, 1923.'

"Each coal district, if not each mine, has its own local customs and problems, determined by the quality of coal, thickness of seam, attitude of the bed, conditions of mining, the markets which it can reach, its freight rates, its labor policy and other factors. In the matter of wage scales, even in the union districts where wage scales are determined by joint agreement, we find variations from district to district and from mine to mine. Still more difficult to summarize are the wage rates in non-union mines. Not only are these wage rates complicated but the opportunity to labor varies so greatly from field to field or mine to mine, depending on character of coal, nearness to the market and commercial connections, that it is hazardous to make any generalization concerning miners' earnings.

"No less difficult under such conditions is the determination of average cost or profit. These subjects require specific and very detailed, painstaking investigation, which is complicated by the varying prices charged and received for the coal, quantity and quality both entering into the subject. The bituminous output is consumed approximately in the following percentages: Railroads, 28; industrials, 25; coking, 15; domestic, 10; iron and steel, 7; public utilities, 7; export, 4; mines, 2; bunkers, 2.

"The coal industry does not end at the mine. Some 180 railroads take the coal at the mine mouth and transport it to thousands of destinations. Because the railroads are the largest customers of the bituminous industry, and because coal—anthracite and bituminous—constitutes one-third of the railroad's freight, the problems of the two are closely interwoven and their interests interdependent. Not only does irregularity in coal output mean serious fluctuations in revenue but excessive irregularity imposes impossible traffic demands on the railroads. On the other hand, interference with rail transportation means a corresponding stoppage of output for the mines and shortage of fuel for the consumer. No solution of the coal problem can be found that does not recognize this community of interest between coal and transportation. But this community of interest, though simply stated is not simple upon examination. The movement of coal by rail and water is complicated by variations in freight rates, arbitrary differentials and competition between different coals and between carriers.

"Nor does the coal industry end with transportation. To connect the thousands of producers, big and little, with more than 90,000 buyers of carload-lot coal scattered over 48 states requires a widespread system of wholesale marketing. Sometimes this marketing is reduced to the simplest terms, as when a steel plant or railroad buys a mine and consumes its entire output. Sometimes it is conducted by the selling department of a large operating company. Sometimes the task of bringing together producer and consumer is performed by an independent wholesaler or selling agent. There are some hundreds of large wholesalers and a much greater number, perhaps 3,500 in all, of smaller middlemen. Like the business of running mines, the business of selling has its problems and, like mining, it has also its abuses.

"The final link in the chain of coal supply is the retailer, who receives coal in carload lots from car or yard storage and delivers it in smaller quantities to the consumer. There are some 38,000 retail coal dealers, most of them conducting a small business. They handle about 130,000,000 tons of coal, or 14 per cent of the bituminous and two-thirds of the anthracite produced.

This commission has reason to believe that an agreement will be reached in the near future that will avert any widespread cessation of mine operation in the union fields on April 1, thus assuring the needed coal supply for at least another year.

"Combined charges of the railroad, the wholesaler, and the retailer in most localities exceed the price of the coal at the mines. Therefore it is readily seen that the problem whether the transportation and marketing charges are just and fair is of the utmost concern to the consumers of coal.

"*Deficiencies in Service.*— The widespread public dissatisfaction with the service rendered by the coal industry is not confined to matters of shortage and price, for a train of unfortunate consequences has followed those recurring periods of scarcity: Deterioration in the quality of fuel delivered; congestion of railway traffic, necessitating the neglect of other freight to give preference to coal, to the serious harm of other business; and breakdown of mutual confidence of producers and consumers of coal as expressed in the customary contractual relations.

"How many there are we do not yet know, but there are certain mines which contract a part of their potential output, reserving the balance for spot coal. These operators guard themselves against car shortage by clauses which compel them to fill their contracts only in proportion to the relative car supply. So in recent years, when speculators with contracts could get only a partial supply of cars, say 60 per cent, they would use only that percentage of available cars for deliveries upon their contracts, while the other cars would be used for spot coal; that is, they prorate their contracts with the sole purpose of having free coal for a higher spot market.

"The record of production and distribution of coal in recent years may be summed up in the word 'instability,' and this instability in the supply of one of the most fundamental of all raw materials has been an important cause in unsettling business and in delaying the return of normal times.

"(1) *Large Profits.*—It has been suggested to us that one of the causes of high prices of coal is profiteering. There has been profiteering in the sense that grossly exorbitant profits have been taken at times by many operators, brokers, and retailers; profits that have been disproportionate to the cost of the coal or the service rendered or the risk incurred. But this commission has not yet obtained the figures for the past ten-year period specifically required by the act in order to settle this question. A thorough examination of the profits of production and distribution, including the revenue derived from associated enterprises, is already under way.

"(2) *Labor Difficulties.*—Others attribute the instability in the coal industry primarily to labor troubles. There can be no doubt that two of the three periods of high prices since 1916 have been caused largely by labor troubles. In the first period of scarcity—August, 1916, to March, 1918—there were no strikes of consequence and therefore some other explanation of the high prices and distress must be found.

"The second period of runaway prices, November, 1919, to late in 1920, was originally caused by a nationwide strike of miners beginning November 1, 1919. In this case the shortage created by the strike was aggravated by difficulties in transportation resulting in part from severe weather and in part from a strike of railway switchmen, and was further intensified by an unprecedented demand for export and by boom times at home.

"In the third period of shortage and high prices from which we have not yet emerged, the primary cause was a nationwide suspension of mining, involving practically all union men, which closed the anthracite region completely and shut down two-thirds of the capacity in the bituminous fields of the United States and Canada. As the merits of that suspension, whether it more resembled a 'strike' or a 'lockout', the commission expresses no opinion in this report. The point of immediate interest is that, as before, the effects were prolonged and intensified by transportation troubles until prices rose alarmingly and industrial plants began to close.

"We may refer to the unfortunate and unusual coincidence of the general cessation of work in the union mines in the summer of 1922 with that of the railroad shopmen and other crafts within the same period. The former very largely curtailed the output of the

mines and the latter so affected transportation in the fall and early winter as to interfere seriously with the distribution of coal. The effect was seriously to deplete the usual supply of coal with which the country enters the winter.

"When work was resumed and the mines were once more turning out their product, it was found that the increased output could not be distributed apace with production, for the effect of one cessation of labor was not so quickly remedied as the other, and not even yet has the transportation equipment been restored to its former condition. With the shortage of coal and lack of railway facilities the fall season opened with general bidding for the supply on hand. Prices were forced up with the obvious effect on the public.

"Whatever the cause or the merits of the labor controversy, it is clear that an indefinite repetition of these crises in the production and distribution of coal would be intolerable. Industry and the home alike must be freed from the menace of constant interruption of their coal supply.

"The responsibility of settling its disputes rests primarily upon the industry. The commission appreciates not only the importance of this principle but realizes also that it is vested by the law creating it with no functions of mediation or arbitration and only when it had reliable information that the efforts of the parties in controversy to reach a basis of agreement were on the verge of failure did the commission feel constrained to offer its suggestions. With knowledge of the fact that a suspension was threatened on April 1, 1923, in the unionized bituminous coal fields, it could not sit idly by and not use its good offices to promote peace. It therefore warned miners and operators alike that the country looks to them to settle their own disputes and to reach an amicable agreement when the present contract expires. In this spirit the commission addressed the following telegrams to the joint meeting of operators and union miners at Chicago, on the third of this month:

The United States Coal Commission respectfully calls your attention to the fact that among the subjects assigned to it by the Congress of the United States for investigation is that of the causes which from time to time induce strikes in the industry. There is sharp conflict in opinions expressed to the commission as to whether the cessation of work on April 1, 1922, in the unionized bituminous coal fields of America was a strike by the miners or a lockout by the operators.

As the duly appointed representatives of operators and miners in the fifteen organized union districts, you have met for the purposes of finding a way to maintain peace in your fields. Failure to agree would create an intolerable situation. Such failure would inevitably result in most serious injury to the general business and common welfare of this country. All branches of the industry have promised this commission their co-operation in the discharge of its duties. The commission, therefore, in the public interest urges upon you the obvious necessity of promptly devising some plan whereby the mines affected by your conference will be kept in operation to the end that the revival of all industry be unchecked, the uninterrupted flow of commerce among the states be maintained, and the menace of an insufficient coal supply be averted.

Business halts while in doubt as to your action and awaits with anxiety the speedy and successful outcome of your labors!

You can contribute to the peace of American economic life by reaching a speedy agreement and avoiding further conflict in the fields under your control. Your agreement will spare the commission the necessity of fixing the blame for failure to adjust your differences.

[Signed] JOHN HAYS HAMMOND,
Chairman, U. S. Coal Commission.
Washington, Jan. 2, 1923.

The Congress of the United States, charged with the duty of legislation for the general welfare of the American people, has created the United States Coal Commission to investigate the coal industry and to report the facts which it may find and to make recommendations to assist the legislative branch of our government in its efforts to guarantee justice to all concerned, to stabilize the industry, and to keep the mines in uninterrupted operation.

This commission has not yet had time to ascertain the facts nor to reach any conclusions as to the merits of your controversies, but it is satisfied that delay in reaching an agreement is bad for the whole country and that every interested party would suffer a greater economic loss by the closing of your mines even for a comparatively short period than would be sustained by a continuance of your present agreement until April 1, 1924.

If therefore all efforts to reach an agreement fail the commission urges you in the interest of the common welfare to continue your present arrangement until April 1, 1924, by which time this commission expects to have found and reported fully all the facts over which your disagreements have arisen with recommendations to the Congress and by which time the Congress will have had opportunity to consider and take such action in the premises as it may deem wise.

[Signed] JOHN HAYS HAMMOND,
Chairman, U. S. Coal Commission.
Washington, Jan. 4, 1923.

We are seeking to promote industrial peace by ascertaining and publishing certain facts. The first group of these includes reliable data on wage rates and earnings, on the volume of employment, on the costs and profits of the industry, on the competition of other fuels and of coal produced by non-union mines.

A second group of facts required includes the effect upon the industry of provisions for the check-off of union dues, participation in management or limitation upon freedom of management, and other working conditions.

"In response to the above a telegram was received on Jan. 5 from Phil. H. Penna, chairman of the conference, as follows:

Your telegrams dated Jan. 2 and Jan. 4, addressed to the joint Reorganization Committee of Bituminous Coal Operators and Coal Miners, were given serious consideration by the operators in their meeting here today, after they had failed in their efforts to reach an agreement with the miners upon a method for future wage scale making.

The joint conference made earnest, serious and sincere effort to reach an agreement. The cumbersomeness of a nation-wide conference of bituminous-coal operators and coal miners, representing fifteen producing districts, made success impossible. The diversity of opinion and the divergence of interests in such a gathering is obvious to any competent observer.

The operators' proposal to the conference was the only one upon which agreement could be reached among themselves. We believe further it offered a practical and practicable solution of the difficulties. We regret that the miners could not agree with us on this proposal. No other solution could come from this conference.

As to renewal of the present arrangement with the miners, as requested in your telegram dated Jan. 4, a reading of the Cleveland agreement with the miners, dated Aug. 15, 1922, will disclose that the present conference has no power, jurisdiction or authority to take such action. The conference or conferences to consider this matter comes subsequent to the adjournment of this meeting. The arrangement of such conferences is being given consideration at this time.

"On Jan. 6 the following telegram was received from William Green, secretary of the conference:

Your telegrams directed to me as secretary of the Reorganization Committee, were read to the conferences of coal operators and miners. Each side decided to make reply. Both groups decided to make separate reply thereto.

The United Mine Workers' representatives were profoundly impressed with the advice and suggestions transmitted through your messages. Unfortunately, because of the diversity of interests represented in the conference it was impossible to reach an agreement upon the form and character of a wage scale conference.

You can be assured, however, that the situation is not hopeless but, on the contrary, it is reasonably certain that a wage scale conference will convene before the end of this month.

The United Mine Workers will diligently endeavor to reach a settlement of the wage scale at the earliest possible date.

"On Jan. 11 the following telegram was received from John L. Lewis, president of the United Mine Workers of America:

The United States Coal Commission has already been advised that the representatives of the miners and operators of the Central Competitive Field will meet in joint conference at the Pennsylvania Hotel, New York, on Thursday, Jan. 18, for the purpose of negotiating an agreement for wages and working conditions in the bituminous industry of that area. It is the sincere and earnest hope of the United Mine Workers of America that this joint conference may successfully and quickly accomplish that task. We are anxious to bring about a stabilization of the coal industry that will assure the American public and business and industry in general a steady supply of fuel for the future, and this can best be done by an agreement between miners and operators that will cover a period of two years or more. A contract for such a period would enable industry and business to make their plans for the future knowing that they would be safe from such interruptions to the coal supply as have occurred in recent years.

"The representatives of the United Mine Workers will enter the joint conference in good faith and with a sincere purpose to do their part toward affording such assurance. In the meantime the commission would be relieved of all anxiety as to whether there would be peace in the coal industry, and the Commission could carry on its investigations and reach its conclusions before the expiration of such agreement.

"While the Chicago conference to which the commission's telegrams were sent took no official action, it is seen from the above replies that definite steps were taken at Chicago and this commission has reason to believe that an agreement will be reached in the near future that will avert any widespread cessation of mine operation in the union fields on April 1, thus assuring the needed coal supply for at least another year.

"We are seeking to promote industrial peace by ascertaining and publishing certain facts. The first group of these includes reliable data on wage rates and earnings, on the volume of employment, on the costs and profits of the industry, on the competition of other fuels and of coal produced by non-union mines. All of these subjects the commission's staff is now studying, and the results of its investigations will be made public in supplementary reports to Congress as fast as they become available. Up to this time returns on costs are already received and are being analyzed from about 2,000 operators, representing about 40 per cent of the total bituminous output.

"A second group of facts required includes the effect upon the industry of provisions for the check-off of union dues, participation in management or limitation upon freedom of management, and other working conditions. This also involves investigation of what causes petty strikes resulting in costly stoppage of operations.

"Collective bargaining should rest upon reason rather than upon force. American law and American public opinion recognize the right to organize into unions and the right to work without let or hindrance. It is alleged by the mine workers that in Logan County, West Virginia; Somerset County, Pennsylvania, and elsewhere, free speech and peaceful persuasion have been denied, in violation of the law. It is charged by operators, on the other hand, that the agents of the union have resorted to violence in their efforts to organize the non-union fields and thereby to lessen competition of non-union coal produced at lower costs. We will investigate and report upon the methods used by union miners to organize these fields and the methods used by the operators to prevent such organization.

"(3) *Car Shortage.*—An opinion commonly expressed before the commission is that the primary cause of scarcity and high prices of coal is transportation deficiency. There have been recurring periods of 'car shortage,' and such periods have generally been accompanied by high prices of coal. There are many other causes for the inadequacy of transportation beside the absence of cars, such as lack of motive power, congestion of yards, terminal facilities, or gateways, single tracks where double tracks are needed, inability to co-ordinate movement of boats and cars at ports, strikes of railway labor, and severe winter storms temporarily blockading traffic. Any one of these elements may be responsible for what to the operator at a mine seems a simple 'shortage of cars.'

"Car shortage occurred at intervals before the war, but since 1916 it has appeared more frequently and for longer periods, and is effects upon prices and coal supply have been more serious. This increase in transportation disability as a factor interfering with the movement of coal is in part due to the depreciation of equipment under the strain of war and labor complications. This important subject—inadequacy of railroad equipment—is under careful study by the Interstate Commerce Commission as well as by this commission, and it is hoped that definite findings and recommendations can be made later.

"The so-called 'car shortage' is not always due to insufficient coal-carrying equipment alone. In part it has been due to an overload upon the transportation system beyond what that system could reasonably or properly be expected to bear. The period of coal shortage and high prices from the middle of 1916 to March, 1918, was marked by almost continuous complaint of lack of cars at the mines. But the volume of traffic thrown upon the roads as a result of the war exceeded anything in their previous history, and when by the summer of 1918 adequate preparation had been made to handle the traffic all current requirements for coal were met and an unprecedented surplus accumulated in storage.

"In the next period of shortage—November, 1919, to late 1920—the roads were called upon to make up for six weeks' stoppage in coal production caused by a nationwide miners' strike. On Nov. 1, 1919, the union bituminous miners stopped work, and when they resumed, on Dec. 13, the movement of coal was 26,000,000 tons behind the previous year. The railroads were then asked to make up the deficit and to do it on top of the regular current movement of coal and other freight. The extra load came at a time when the export business in coal was unprecedented and when general business was booming. Even so, the railroads could probably have met the demand had it not been for the severe storms of that winter and the switchmen's strike of the following spring. As it was, they established a new record for total volume of traffic handled, and by the end of 1920 the deficit in coal supply had been overcome and the price was again normal.

Short working time is the result of overdevelopment in the industry. There are more mines and more miners than the needs of the country require.

"Since the resumption of work, in August, 1922, after five months cessation, more bituminous coal has been offered for shipment than the railroads have been able to carry, but only by investing money in a transportation system vastly in excess of reasonable requirements may the people of the country expect the railroads to make up within a few weeks the consequences of the five month's suspension of a large part of the coal mining.

"At the beginning of 1923 the bituminous coal industry presents to the country its usual contradictions. The one complaint common to most of the coal mining territory is that of 'car shortage'; yet the outstanding fact is that in spite of a miner's election day and the Christmas holidays, these coal mines produced in December, 1922, over 46,000,000 tons of soft coal. An actual shortage of anthracite has kept domestic consumers on the verge of a buyer's panic, restrained only by the co-operation of the larger coal operators with the federal and state fuel distributors, yet the 46,000,000 tons of soft coal was probably sufficient for the country's needs for current consumtion, even in December, if evenly distributed. The fact that low coal reserves in the hands of the consumers are not being rapidly replenished doubtless adds to the fear of scarcity, yet a full-car-supply for the country's soft coal mines, as rated by the railroads, would have furnished transportation in December for more than 75,000,000 tons or 20,000,000 tons more than the country ever took from the mines in a single month. Plainly, '100 per cent car supply,' as based on such inflated ratings, would create a car surplus or a coal surplus far beyond the ability of the market to absorb.

"(4) *Overdevelopment.* — Already in our study we have come to see that underlying these immediate causes of scarcity and high prices—labor difficulties and transportation deficiency—are other causes; namely, the irregularity of demand and the overdevelopment of the mining industry. These basic factors apply directly only to bituminous coal but indirectly they affect anthracite as well, for anthracite is in competition with bituminous coal and the wage scale in the one industry is influenced by changes in the other.

"We find that in the bituminous industry since 1890 the mines have averaged, over the country as a whole, only 213 days out of a possible working year of 308 days. These averages, of course, show nothing as to the relative annual earnings of individual miners or their individual opportunity to work. In 1920, a year of active demand, the average time worked was only 220 days, and in 1921, the year of depression, it dropped to 149 days, with many districts showing a figure much below this average. Over a long period comparatively little of the time lost has been on account of strikes and that in the years when there are no strikes the aggregate time lost from all causes is about as great as in those when strikes occur. In the twenty-three years over which the statistical record of strikes extends, the time lost because of strikes has averaged 9 days a year, or less than 10 per cent of the time lost for all causes combined.

"The other attributed cause, lack of transportation facilities during the annual peak of railroad business, commonly known as 'car shortage,' enhances the cost to the consumer, but it does not explain the short working year for the miners. When the needed coal is supplied the miner gets it out at one time or another and his work takes so much time and no more. Short working time is the result of overdevelopment in the industry. There are more mines and more miners than the needs of the country require.

"A cause of part-time operations of the bituminous mines is the variation in demand for the product, in part annual and in part seasonal. In so far as the irregularity in demand is seasonal, greater in cold weather than in summer, the lost time in summer is unavoidable unless some means can be devised to encourage the storage of coal during the dull months. The seasonal fluctuation in demand varies greatly from one district to another; in some fields of the East it is unimportant; further West it is dominant.

"Moreover, our preliminary studies show that even in times of maximum demand the mines as a whole do not work full time. In other words, the mine capacity is in excess even of maximum requirements. Although the country has never been able to absorb

in a year more than 579,000,000 tons of bituminous coal, the present capacity of the mines is well above 800,000,000 tons.

"The steady increase in the army of bituminous coal miners during the last four years, notwithstanding a lessened demand for their product is also a fact that stands out in the statistical records furnished the commission by the U. S. Geological Survey. In 1918, the year of maximum coal output, when 579,000,000 tons were mined, 615,000 men were employed in the bituminous coal mines, nearly 622,000 the next year, over 639,000 in 1920, and in 1921 663,000 mine workers were employed in producing about 416,000,000 tons. To get a year comparable in soft coal output with 1921 we have to go back to 1910, when 417,000,000 tons were mined, and it is significant that in that year less than 556,000 mine workers were employed—or about a million more tons of coal with 100,000 fewer miners.

"The difference between 1910 and 1921 may be viewed by the consumer of bituminous coal somewhat as follows: The manufacturer who bought 10,000 tons of steam coal in 1910 paid for the year's labor of 13⅓ mine workers, whereas if he bought the same amount of coal in 1921 he paid the wages of nearly 16 mine workers. This plainly is not progress, but the mistake must not be made of blaming the miner for a decreased output, for the average miner's daily output in 1921 was 4⅘ tons, taking the 8,000 commercial mines, large and small, in the United States, and in 1910 his daily output was about 3½ tons, although this difference is attributable in part to the increased use of machines. But in 1910 the average bituminous coal mine was operating 217 days as against 149 days in 1921.

"This condition of overdevelopment in mines and of surplus number of miners is an underlying cause of the instability of the industry. It means unemployment and intermittent employment to the coal miner and a direct loss to him of earning power. It explains his need and demand for a day wage rate higher than the average for most other industries. It has also adversely affected the profits of the operator and imposed a burden on the consumer.

"The seasonal character of coal movement is a serious handicap to the railroads in those districts where it is the rule. If the peak demands of the mines are to be met the carrier must provide equipment for which there is no use in the off-season.

"The unequal distribution of work between mines, attributed by many persons to the assigned- and private-car system, is also being considered by the Interstate Commerce Commission at this time. By this system men in one mine may get perhaps only one day's work a week, and others, even in an adjoining mine, may get six days' work, causing discontent and strengthening the demands for higher rates of pay applicable to all.

"As for the public, the cost of maintaining an overdeveloped industry is reflected in the high price of coal. We do not know accurately the extent of burden, but it may well be measured by the cost of keeping in the industry an excess of perhaps 20,000 miners and their families and the excess investment in mines.

"The commission is convinced that there can be no permanent peace in the industry until this underlying cause of instability is removed. Diverse causes have apparently promoted overdevelopment and inquiries are in progress as to the relative importance, among others, of the following: The policy of railroads toward encouraging the opening of new mines and new mine fields as sources of revenue; car distribution rules that permit, if they do not encourage, larger capacity than the market obviously requires; the opening of new mines by large consumers; the establishment of freight rates that encourage the development of new fields; shifts in centers of consumption that abandon old fields and encourage new fields; the difference between union and non-union wage costs; large scale suspensions in the unionized fields; and irregularity of demand.

Collective bargaining should rest upon reason rather than upon force. American law and American public opinion recognize the right to organize into unions and the right to work without let or hindrance. It is alleged by the mine workers that in Logan County, West Virginia; Somerset County, Pennsylvania, and elsewhere, free speech and peaceful persuasion have been denied, in violation of the law. It is charged by operators, on the other hand, that the agents of the union have resorted to violence in their efforts to organize the non-union fields and thereby to lesson competition of non-union coal produced at lower costs. We will investigate and report upon the methods used by union miners to organize these fields and the methods used by the operators to prevent such organization.

"(5) *Coal Storage.* — A preliminary survey indicates that much can be done to overcome irregular demand by encouraging the storage of coal, and the commission cannot stress too strongly the great advantage of coal storage during the spring and summer for fall and winter use. This recommendation should apply to all consumers of coal—the railroads, the public utilities, the industries, and the home—and on the measure in which it may be adopted will largely depend the evenness of distribution and the cost of coal to the public during the season of heavy consumption. In addition, it will contribute to more continuous operation of the mines during the summer, distributing employment more evenly throughout the year, thus tending to stabilize the industry. Coal storage, generally adopted by the consumer, large and small, would benefit the carrier systems of the country by equalizing their load. It should have the effect of reducing the price of coal to the consumer.

"The way in which to reduce the overdevelopment of the mining industry is fraught with so many complications, not all of which are evident at first glance, that the commission has not yet had time to ascertain sufficient facts on which to base any recommendations now to be made to the Congress. While it might be expected that in an overdeveloped industry aggressive competition would have driven out mines with high producing costs and forced prices to the consumer down to a minimum, so many such complex factors have operated to prevent the free play of economic forces that a very detailed and comprehensive investigation is required before a valid conclusion can be reached.

"The inquiry involves the whole question as to what is best for the people, free competition, government or private ownership, regulation or control in the coal industry. Should the operators in given areas be permitted to combine so that the low-cost mines would furnish the product to the people and the high-cost mines kept in abeyance to meet an emergency, properly regulated as to price and profit by some governmental agency, or should this prime necessity of life and business be left wholly to open competition in the market? This problem is of so great moment, with reference not only to theories of government but also to the economic life of the the Republic, that the view of the commission must be left to its final report.

"There can be no satisfactory agreement as to wage rates and no lasting peace between operators and men unless steadier employment can be provided. There can be no satisfactory solution of our transportation problem as long as the railroads are subjected to sudden peak loads of coal traffic at the season when the demands of agriculture and industry are at their height.

"The commission believes that the public interest in coal raises fundamental questions of the relation of this industry to the nation and of the degree to which private right must yield to public welfare. It may be that both private property in an exhaustible resource and labor in a public service industry must admit to certain modifications of their private rights, receiving in return certain guarantees and privileges not accorded to purely private business or persons in private employ.

"CLARK HOWELL,
"GEORGE OTIS SMITH,
"EDWARD T. DEVINE,
"CHARLES P. NEILL."

"I approve, and if a qualified member of the commission would sign the foregoing report. While appointed and confirmed as a member of the commission, being a Federal judge, I could not lawfully at the same time hold the commissionership without authorization by Congress. But at the request of the President and of the commission I have been present and advised with the commission in all its proceedings, without having qualified as a member of it.
"SAMUEL ALSCULER."

Anthracite Output Hits Lowest Level Since 1902

Five Months Tie-up Cuts Total to 52,465,000 Net Tons in 1922 Compared with 90,474,000 Tons in Preceding Year—Operators Co-operate with Federal and State Officials to Hold Prices Down

BY W. A. WHITE

VIRTUAL paralysis of mining caused by the 163-day tie-up of the mines, of course, was the outstanding feature of the anthracite industry during 1922. Production records show how seriously the strike affected the output of hard coal—52,465,000 net tons was mined in 1922 as compared with 90,474,000 tons in 1921, and the output was less than in any of the years since 1902. Production during the last twelve years is shown in the following table:

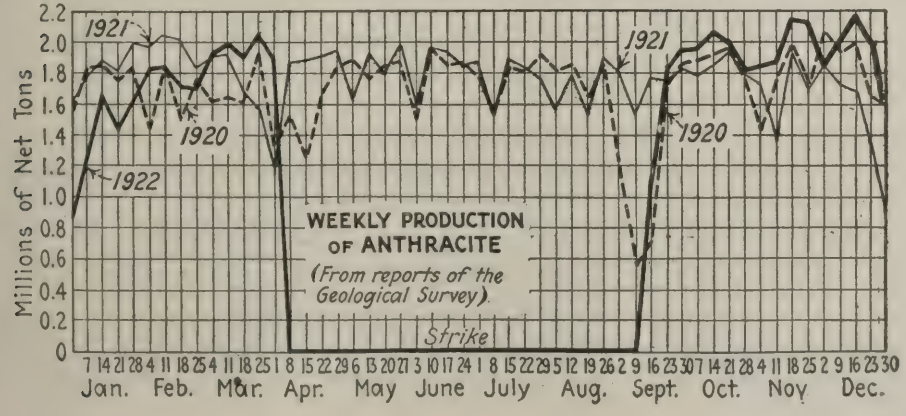
ANTHRACITE PRODUCTION, 1911-1922, IN NET TONS.

	Million Tons		Million Tons
1911	90	1917	100
1912	84	1918	99
1913	92	1919	88
1914	91	1920	90
1915	89	1921	90
1916	88	1922	52

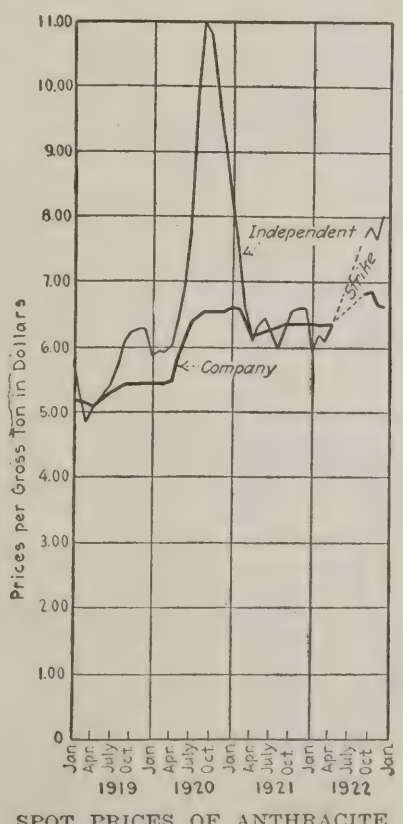
Early in 1922 production lagged because of market conditions. Even the approach of the strike failed to stimulate prices and demand, and it was not until well into March that there was much real buying activity. Retailers' stocks were as heavy as in the preceding spring and the feeling existed, as in the bituminous-coal trade, that "something would avert a long tie-up and make excessive stocking unnecessary."

Prices dropped lower and lower and early in the year independent steam coal was in distress much of the time and the larger producers ran heavily to storage. Even domestic sizes were placed in storage against the inevitable rush that was to come. The year opened with independent prices averaging approximately $5.96 for all sizes. Severe coal-burning weather raised this to $6.19 in the first 60 days of 1922, but the market failed to sustain this level, and even in the face of the strike the independent average dropped to $6.09 for March.

Aside from a few cars per day of small sizes dredged from the rivers, anthracite production was nil from April 1 until Sept. 11. Producers' storage tonnage was quickly moved and the independent product soared. Long before the strike ended producers were besieged with orders for delivery at the earliest possible moment, with price to be determined when mining was resumed.



The rush to cover became a mad scramble when mining started and prices for independent tonnage increased by leaps and bounds. Winter scarcity of domestic sizes was foreseen and steps were taken to safeguard the supply and restrain exorbitant prices. On Aug. 1 the Governor of Pennsylvania appointed a State Fuel Commission of seven members, headed by W. D. B. Ainey, Chairman of the Public Service Commission, to cooperate with the federal authorities in the distribution of coal. At a joint meeting of this commission and Secretary Hoover, on Sept. 7, a Committee on Distribution of Anthracite was appointed, headed by S. D. Warriner, chairman of the General Policies Committee of the Anthracite Operators, with E. W. Parker as Director of Distribution. The committee immediately directed each producer to distribute his tonnage in the normal way, that each state receive approximately its proper share of current production.



Mine prices became the subject of immediate attention and on Sept. 20 a decision of the Pennsylvania Fuel Commission was made public fixing $8.50 per gross ton as the maximum mine price for stove and chestnut sizes, but stating that a Fair Practice Committee, empowered by the commission, would consider the cases of operators unable to sell at such maximum. Independent quotations were $9@$9.50 at the time this announcement was made, although some coal moved as high as $14. Independent operators protested against the $8.50 maximum and threatened, if they failed to receive a price in excess of that announced by the committee, to ship their product outside the State of Pennsylvania and beyond the jurisdiction of that body. Examinations of production costs were made from time to time and individual operators' schedules raised in accordance with their cost data. Pending these examinations the independent

* Relative price is comparison with average spot prices in the 12 months preceding the war, July 1913, to June, 1914.

SPOT PRICES OF ANTHRACITE, WEIGHTED AVERAGE, ALL SIZES PER GROSS TON, MINES

operators were authorized to charge prices that were considered fair by the Fair Practice Committee of 1920.

As the year closed the Pennsylvania Fuel Committee approved a final set of fair prices for individual operators as shown in the accompanying table of prices.

Fully two weeks elapsed after mining was resumed before the old-line companies announced their new price circulars. Tonnage held at terminals pending price determination was released by the publishing of temporary prices ranging $7.75@$8.35 for domestic coal. Increases of 15c@30c as compared with latest pre-strike quotations were made, presumably to cover the Pennsylvania state production tax.

Company Quotations

Following are the company quotations per gross ton f.o.b. mine as quoted on the New York market, announced after the resumption of mining:

Lehigh Valley—Broken, $7.90; egg, $8.10; stove, $8.15; chestnut, $8.15; pea, $6.15; buckwheat, $4; rice, $3; barley, $2.

Williams & Peters (Erie)—Broken, $7.75; egg, $7.75; stove, $8; chestnut, $8; pea, $6.15; buckwheat, $4; rice, $3; barley, $2.

Lackawanna — Broken, $7.75; egg, $8; stove, $8; chestnut, $8; pea, $6.15.

Lehigh & Wilkes-Barre Coal Co.—Broken, $7.75; egg, $8; stove, $8; chestnut $8; pea, $6.15; buckwheat $4; rice, $3; barley, $2; boiler, $2.50.

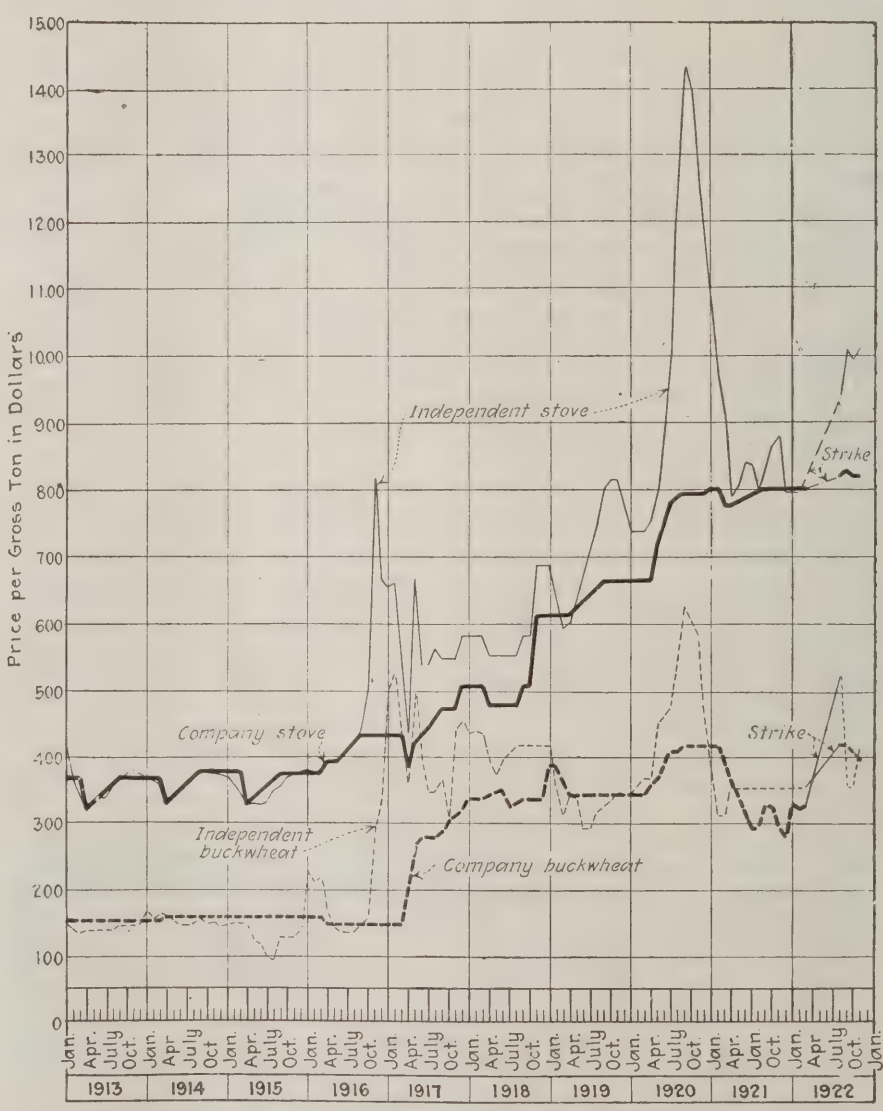
Lehigh Coal & Navigation Co.—Broken, $8.10; egg, $8.35; stove, $8.35; chestnut, $8.35; pea, $6.20; buckwheat, $4; rice, $2.75.

Hudson—Broken, $8.15; egg, $8.15; stove, $8.15; range (new size) $8.15; buckwheat, $4; birdseye, $2.75.

Philadelphia & Reading — Broken, $7.90; egg, $8.10; stove, $8.20; chestnut, $8.20; pea, $6.20; buckwheat, $4; rice, 2.75; barley, $2.

Quotations on steam sizes also were increased, in line with soft-coal prices.

Fair Prices Usually Adhered To



Although the majority of the individual operators adhered to the fair price lists authorized for them, there were a few who insisted upon going above these prices. This premium tonnage was small, both because dealers were loath to pass extra costs on to their household trade and the capacity output of these producers amounted to very little when compared with the total anthracite production.

Canada, however, presented an alluring market for high-priced coal. Early in the autumn these buyers began to flock to the United States and doubtless weaned away considerable coal by offering fancy prices for it. When cold weather came, their importuning increased and so did their scale of prices until $14@$16 coal was moving across the border. So urgent was this Canadian demand in December that cash payments were made before the coal was loaded—another inducement to insure prompt order filling. Naturally this augmented flow of coal away from domestic points where it was urgently needed is causing much complaint and some attempts are being made to stop it.

Car shortage, which played such havoc with the bituminous-coal industry, had little effect in the anthracite region. There was, however, an embarrassing variety of equipment placed for loading, some of it of a type which retarded production. The late summer and autumn was marked by one of the worst droughts in the history of the anthracite industry. In order to operate it was necessary in many cases to haul fresh water in tank cars, and this made maintenance of production difficult and added to the operating expense.

The U. S. Supreme Court in the last week of November upheld the Pennsylvania Anthracite Tonnage Act of 1921. This act, which places an additional burden on anthracite consumers both within and without Pennsylvania, fixes a tax of 1½ per cent of the market value of the coal at the mine, when prepared for market, became effective July 1, 1921, and the estimated amount of tax due by the end of that year was $3,273,840.61. Pennsylvania authorities estimate a yearly yield from this tax of around $7,000,000, which probably levies 15c on each ton of domestic fuel produced. This tonnage tax was tested out in the Dauphin County Court at Harrisburg, decision upheld, appealed to the Pennsylvania Supreme Court, where it was again upheld. Finally, the U. S. Supreme Court sustained the state court and upheld the distinction between anthracite and soft coal as a legitimate one for tax purposes.

The Kohler mine-cave act, with which the Fowler act is linked, was upheld by the Pennsylvania Supreme Court. The former gave wide discretionary powers to municipal officers over the mining of hard coal within municipal limits and made it a criminal offense to conduct mining operations which result in injury to surface property or to individuals on the surface. The Fowler act created a fund for the repair of surface damage due to mining and any coal company accepting the act was to pay regularly into the fund

ANTHRACITE PRICES FOR TEN YEARS

This diagram shows in dollars per gross ton the average company circular prices and average spot quotations on "independent" stove and buckwheat sizes of Pennsylvania anthracite at the mines. Prices shown are averages of the range as quoted on the New York market.

Fair Prices Established Jan. 1, 1923, by Pennsylvania Fuel Commission

The commission only fixed prices in cases where the mining companies had been charging more than $9.25 a ton, no prices having been set for those companies, including nine big anthracite operators, whose selling prices at the mines range $8.00@$8.35.

The prices which have been established by company operators, f.o.b. mines, are as follows: Glen Alden Coal Co., $8; Hillside Coal & Iron Co., $8.25; Hudson Coal Co., $8.25; Lehigh Coal & Navigation Co., $8.35; Lehigh Valley Coal Co. and Coxe Bros., $8.15; Lehigh & Wilkes-Barre Coal Co., $8.00; Pennsylvania Coal Co., $8.25; Philadelphia & Reading Coal & Iron Co., $8.30, and Scranton Coal Co., $8.25. Other operators' prices follow:

OTHER PRODUCING COMPANIES

Price, Gross Tons

1920 Output	Operator	f.o.b.	Mines
451,668	Alden Coal Co.	$10.00	Incl. 20c. com. to Whitney & Kemmerer
128,281	Archbald Coal Co.	12.00	Incl. selling costs
56,975	Bald Mountain Coal Co.	9.50	Incl. 20c. com. to Whitney & Kemmerer
29,126	Bergen Coal Co.	12.00	No selling com. to be allowed; includes $1.50 for hauling mines to cars
242,658	Buck Run Coal Co.	10.50	25c. selling com. to be added
5,618	Butcher Creek Coal Co.	11.00	Does not provide for com.
34,351	Carney & Brown Coal Co.	11.25	Selling cost incl.
75,069	Central Coal Co., W.-Barre	12.00	
73,930	John Conlon Coal Co.	10.25	To which a com. of not exceeding 25c. may be added
	Cullen Fuel Co., Inc.	12.00	No com.
202,446	Darkwater Coal Co.	11.00	25c. com. to be added
183,809	East Boston Coal Co.	12.00	Incl. com.
271,461	East Bear Ridge Collieries	11.00	Com. of 25c. to be added
56,839	East Point Coal Co.	12.00	
61,290	Ebans Colliery Co.	9.25	
216,160	Excelsior Coal Co.	9.25	
191,114	Haddock Mining Co.	10.50	
24,787	Humbert Coal Co.	11.50	No com. allowed
40,874	M. S. Kemmerer & Co.	10.00	Incl. 20c. com. to Whitney & Kemmerer
975,411	Kingston Coal Co.	9.75	Com not to exceed 25c.
128,221	George F. Lee Coal Co.	10.00	Com not to exceed 25c.
277,589	Leggitt's Creek Anth. Co.	11.50	Incl. com.
	Madeira, Hill & Co.	10.50	Incl. selling costs
284,079	Connell Anth. Mng. Co.	9.25	
494,164	Mt. Jessup Coal Co., Ltd.	10.00	Incl. 20c. com. to Whitney & Kemmerer
67,951	Nay Aug Coal Co.	12.00	Com. not to exceed 25c.
277,865	Pine Hill Coal Co.	10.50	Com. of 50c. may be added
179,481	Oak Hill Coal Co.	10.50	
162,699	Pittston Coal Mining Co.	9.25	
15,545	Plymouth Red Ash Coal Co.	11.00	Com. of 25c. may be added
388,116	Price Pancoast Coal Co.	10.00	Incl. 15c. com.
158,889	Racket Brook Coal Co.	12.00	Com. not to exceed 25c.
97,999	Raub Coal Co.	11.00	Com. not to exceed 25c.
300,348	St. Clair Coal Co.	11.00	Additional 25c. for com.
144,048	Shipman Coal Co.	11.00	
84,391	E. S. Stackhouse Coal Co.	12.00	
1,438,448	Temple Coal Co. Kacka. Coal Co., Ltd. Northwest Coal Co. Sterrick Creek Coal Co. Mt. Lookout Coal Co. Harry E. Coal Co.		
	Forty Fort Coal Co.	9.25	Incl. 20c. com. to Thorne, Neale & Co.
172,546	Traders Coal Co.	11.00	Com. of not more than 25c.
155,072	Treverton Colliery Co.	11.50	Not to exceed 25c. com.
198,411	A. S. Van Wickle Estate	11.00	
118,813	J. S. Wentz Co.	9.25	

and be relieved of liability for monetary damage. This act was not accepted by operators and the Kohler act was deemed so strict that a number of mines in the Scranton district have been closed for nearly a year rather than take chances by operating. The United States Supreme Court on Dec. 11 declared the act unconstitutional.

Another disturbing feature during 1922 was the effort of Schuylkill and Northumberland counties to greatly increase the taxation on anthracite properties under the regular triennial assessment of 1922. Final settlement of these matters is still pending. Coal lands in Schuylkill County given a total valuation for taxation purposes in 1921 of $62,348,514 were placed at $437,878,684 under the triennial assessment of 1922; Northumberland County's 1921 figures of $24,134,661 were changed to $50,553,541 by the county authorities.

Quick recovery of mining following the strike settlement was possible as maintenance work had been continued with good effect. But even this feature was insufficient to overcome the tremendous handicap imposed by the long idleness.

Strike Runs Violent Course for 137 Days

Hampers Industry Almost as Much as War—Miners Win Wage Demands and Stave Off Arbitration, Which Constitutes Victory—But Industry May Benefit Vitally from Coal Commission's Work

By E. W. Davidson

THE strike of 1922 paralyzed the union coal fields of America for four months and fifteen days beginning April 1, exhausted the country's monumental soft-coal stock of more than 60,000,000 tons in spite of non-union production that ran as high as 5,000,000 tons a week, and disturbed both the industrial and economic structure of the nation as nothing has disturbed it in years except the Great War. The conflict was a victorious one for the United Mine Workers of America in the sense that the union forced the continuance all winter of war-time wages and successfully resisted wage arbitration. The operators were the losers in the sense that they lost every important point for which they contended, were more than ever maligned by the public for soaring coal prices and fuel shortage, and because they failed absolutely to develop any unity or cohesive strength among themselves.

The country as a whole and possibly the industry as a whole, however, may have won something vital out of all the travail of 1922 because the government was moved to create the United States Coal Commission, which is now making a study of all phases of coal with a thoroughness never equalled in this country. If its recommendations are sound and put into practice, miners, operators and the public may have won future content that will be worth the price paid during 1922 in losses, suffering and violence.

Two Refuse to Attend

At the very outset of the year two of the important operator elements in the Central Competitive Field—southern Ohio and western Pennsylvania—declared they would not attend the usual four-state scale meeting, scheduled for Pittsburgh, Pa., Jan. 6, because they were determined upon separate district negotiations. This was the first bombshell dropped into the mine-labor situation, which promptly grew strained. The fact that Illinois, which, with Indiana, composed the balance of the four-state wage-making field, wrote John L. Lewis that it would meet only if a majority of the field did, contributed little toward peace and a settlement.

Confronted by the three important refusals to attend the Pittsburgh meeting, Mr. Lewis, on Jan. 4, called it off and notified all those who had accepted that he was sorry the session could not be held. He said, however: "Representatives of the miners will hold themselves in readiness to take part in such a meeting whenever it becomes possible for them to do so." He asserted that all operators in the Central Competitive Field were violating their agreement by not attending the meeting and declared that "in due time circumstances will compel such a meeting."

In the first weeks of the year the anthracite labor situation was agitated by two factors: The mines were running low because of heavy stocks throughout the country—which set up a good deal of union propaganda that the operators were deliberately trying to starve the miners into a 20-per cent wage reduction—and the miners in various parts of the field were industriously resolving for wage increases varying from 30 to 48 per cent.

Indicating the necessity for a general downward trend of miners' wages around the country, wages in southeastern Kentucky and eastern Tennessee had already been ordered reduced 20 per cent by the permanent arbitration board for that region. No less than thirty mines there had previously reduced wages to the 1917 scale.

Baltimore Meeting Futile

In the Georges Creek and Upper Potomac fields a real effort was made to get a wage adjustment without a strike but after three days of conference in Baltimore nothing had been accomplished. The miners wanted a two-year contract. The operators refused. The operators proposed an agreement without the provision confirming the U. S. Bituminous Coal Commission award. The miners refused. The miners proposed that the old agreement be continued. Then they withdrew that proposal. Finally, with nothing done, the meeting adjourned, leaving about 90 per cent of the Maryland coal fields on a distinctly unsatisfactory basis, unable to sell coal that was produced by miners paid $1.31 a ton for pick work and $7.42 a day for eight-hour day workers.

In the New River field the union lost much prestige among its own members by its refusal even to consider a wage reduction. By the middle of January about 100 mines in that field—virtually the entire field—had made a reduction of $1.40 a day and 10c. a ton in the mining rate, which meant a return to the 1917 scale. Many union locals in District 29 turned in their charters. The checkoff therefore was abolished and the field was practically on a non-union basis.

Early in January it became increasingly apparent that the government proposed taking a hand in the coal situation in case the dispute between miners and operators menaced the public. It was stated at the White House Jan. 13 that several members of the Cabinet were "particularly interested," meaning Secretaries Hoover and Davis.

The non-union operators of the country assured the government that in case of a strike they would be able to produce at least 6,000,000 tons a week and possibly 7,500,000. This was supposed to have had a distinct influence against government interference, which soon became the chief point of speculation in the whole situation. On Jan. 19 Secretary Hoover made a public statement warning the country that the stage was all set for an industrial conflict of the first magnitude. Then followed various political efforts at Washington.

Kenyon Makes His Report

Senator William S. Kenyon on Jan. 27 filed in the Senate his momentous personal report and set of recommendations for governmental action in the coal industry, following the investigation which his Committee on Education and Labor made into the mine-labor "war" along the borders of West Virginia and Kentucky. He classed coal as a public utility and therefore a proper resource for public control. He proposed the adoption of an "industrial code" for the settlement of disputes in the mining industry and that there be created a federal board of three miners, three operators and three men representing the public to adjudicate such disputes. His commission would have no judicial, executive or police power but would hear all sides of any important mine-labor dispute and publish the arguments, that the public might make its own decision.

In the "code" Senator Kenyon proposed that collective bargaining and the right of both miners and operators to organize be recognized and affirmed and that no strikes be called until "a hearing be held the determination of the facts and principles" made.

On Jan. 26 and Jan. 28 the Pittsburgh Coal Producers' Association and the southern Ohio coal operators each announced a new scale they were willing to pay to miners after April 1. The Pittsburgh scale, providing heavy reductions to 77c. a ton for thin vein and 68c. for thick vein pick mining and $4.60 a day for motormen, was offered as being 36 to 40 per cent higher than pre-war wages. The southern Ohio scale showed reductions of from 30 to 47 per cent from the existing scale. Pick mining would pay 77c. as compared with $1.11, machine mining 60c. instead of 94c. and day work $3.75 and $4 instead of $7.50. The announce-

ments of these scales provoked no direct answer from the union, which was demanding no reductions.

Early in February Phil Penna, secretary of the Indiana Bituminous Coal Operators' Association, made a public statement favoring a 30-per cent reduction in miners' wages and a scale made by the Central Competitive Field that could be altered at intervals during the life of the contract to conform to industrial conditions. William Mitch, secretary-treasurer of the miners in the Indiana district, opposed this scheme as one that "would make the operators dictators."

On Feb. 4 the Monongahela Coal Association, in the Scotts Run Field of West Virginia, with sixty-five mines, announced a scale effective April 1 providing a wage cut of 30 per cent and abolishing the check-off. A resolution passed Feb. 10 by the Southern Appalachian Coal Operators' Association in Knoxville, Tenn., declaring against the "closed shop" for that field and against the check-off, was taken to mean that operators there would refuse after April 1, to make agreements even by districts, but that every company would attempt to make its own agreement.

Shamokin Declares for Strike

The anthracite miners made their demands clear at the convention of the three districts in Shamokin, Pa., Jan. 17-21. Contending that "Mine workers have never been paid in a manner commensurate with their hard labor and hazardous employment," the convention decided to demand a 20-per cent increase in tonnage rates, a flat $1 a day increase for day men, restoration of the old differentials existing before the award of the Anthracite Coal Commission and sixteen other things. They authorized a strike April 1 if these were not granted. The General Committee of Anthracite Operators said this would add $1.30 per ton to domestic-coal prices.

With little prospect of agreement in sight joint conferences started in New York March 21 even as President Lewis, of the United Mine Workers, was issuing the national strike order while strike votes from the bituminous regions were still being counted. The only thing the first conferences produced was an agreement to keep 3,000 miners in the anthracite properties to maintain them during the strike about to start. The strike was to be a "suspension" as far as anthracite fields were concerned.

Hard-Coal Operators' Scale

By April 11 the negotiations between anthracite miners and operatiors had merely got to the point of the operators beginning to state their case. A joint subcommittee was doing the negotiating by this time. For weeks the miners tried to get the operators to declare what they were willing to pay. The operators merely persisted in refusing the miners' demands. S. D. Warriner, for the operators, on May 8 declared that setting a wage level acceptable to operators would merely be "trading," and this the operators would not do.

Finally on May 18 the operators formally refused the miners' demands and proposed: (1) Contract rates be decreased 18 per cent; (2) day rates for men be reduced $1.20 and (3) for boys 72c. "This general wage structure," said the operators, "represents an average decrease of approximately 21 per cent, and will, therefore, fully maintain the purchasing value of wages as established by the Anthracite Coal Commission of 1920." The signers were Mr. Warriner, W. J. Richards, W. L. Connell and W. W. Inglis. The miners declined this proposal May 28, saying that further negotiations would be fruitless unless the operators agreed to an increase in wages.

On June 2 the operators proposed arbitration by a commission to be named by the President of the United States. After consideration by the miners in convention at Hazleton, Pa., June 6-7, the miners rejected the new proposal because they said the duties of the commission were too loosely defined, because the commission appeared to be directed to adjust rates according to the operators' May 18 proposal, because no mention was made of the miners' three fundamentals: A living wage, an eight-hour day, and complete recognition of the union; and finally because royalties, freight rates and profits were not to be considered as well as wages.

Wait on Soft-Coal Pact

Negotiations dragged though anthracite operators conferred with miners and with Secretary of the Interior Fall at Washington briefly on July 1 at the time of the White House coal conferences with miners and operators which failed to end the strike. On Aug. 11, just before the bituminous strike ended, President Lewis told the Mayor of Scranton the miners were ready to confer with the operators but that the latter would not make a scale preceding that for bituminous fields.

After the bituminous strike was closed and a contract signed to March 31, 1923, at the old scale, the anthracite miners said they were willing to continue the old scale for two years in the anthracite fields. The operators would not. On Aug. 17 through Senator Pepper, of Pennsylvania, President Harding called both sides to Washington to confer. After five days of insistence by the operators upon a long-term contract with provision for periodic wage adjustment by arbitration, which the miners flatly refused, the operators offered to continue the old scale to March 31, 1923, if the miners would agree to let wages after that date be fixed by the Anthracite Board of Conciliation, first for one year and then, beginning March 31, 1924, for two years. If the board failed to agree then the scale was to be made by three men chosen by the U. S. Circuit Court of Appeals. The miners refused to accept this.

Finally after negotiations had been broken off Aug. 22 in Philadelphia and resumed Aug. 29 in Washington, due principally to the efforts of Secretary Davis and Senator Pepper, the miners agreed they would go back to work at the old scale until Sept. 1, 1923. On the last day of August the operators agreed to this provided they got a "mandate" from the public, since the public would have to pay the cost of continuing the high wages. This was published broadcast and the "mandate" came in the form of many telegrams from over the country and from President Harding. On Saturday night, Sept. 2, a tentative agreement was entered into. On Sept. 11 the strike was officially ended and the mines reopened for another year at "war wages."

The United Mine Workers framed its program of demands at the reconvened session of the 28th annual convention in Indianapolis, Feb. 14-18 and authorized the scale committee to conduct a strike referendum before April 1. In spite of the fact that the scale committee brought in a comparatively "conservative" program, including the "maintenance of the present scale of wages," an eight-hour day underground and adjustment of various inequitable differentials, before the radical element in the convention got through, the "conservative" program had been trampled. The demand that existing wages be maintained was not changed, but the six-hour day and the five-day week were jammed into the list to be demanded of the operators.

Two days after the convention Mr. Lewis, who had declared frequently that the miners did not want a strike, issued another call for a Central Competitive Field meeting with operators at Cleveland March 2. Eastern Ohio, Illinois and Indiana reluctantly said they would attend if the rest did. The rest—southern Ohio and Pittsburgh—refused as flatly as before. The operators in both those districts said they were willing to meet the miners of their own territories only. The miners' union then began polling its membership on the question of giving the international officers the right to call a strike at midnight March 31 in case no agreement was reached by that time.

Rail and Mine Men Conspire

Directly after the Indianapolis convention Mr. Lewis and his principal officers attended a joint conference at Chicago with officials of fourteen railroad brotherhoods and succeeded in forming a rather vague sort of coalition more or less along the lines laid down by Mr. Lewis in letters directed to all the rail brotherhoods early in the month.

As March opened the operators of Illinois began playing hard for a separate state meeting with their miners, hoping that a fracture between the Illinois miners and the international might develop into a schism and permit such negotiations. Then began a series of higgles and haggles on the part of President Farrington of the Illinois union district which ran all spring and summer and resulted in nothing. Far-

rington made vitriolic statements against Lewis but never quite broke away from Lewis' domination.

In the meantime developments all over the country were leading directly up to a general striks. Nine thousand union miners in the western Canadian fields declared they would strike April 1 if wage reductions were put into effect. The operators of the Kanawha field served notice on the union that if the men did not confer with them on wages for that region before March 11 the opportunity would be withdrawn and a lower wage scale would be announced for April 1. The miners refused on March 25 to make any kind of contract. So on March 29 a new scale showing a 30-per cent cut was anounced. In Colorado the miners and operators met March 4 for half an hour and made no progress. Immediately the operators announced a scale showing a cut of 30 to 50 per cent, effective April 1.

Secretary of Labor Davis on March 9 asked all Central Competitive Field operators to confer with the union even though they did nothing but review the situation. Not one goup changed position.

"Hopelessly Messed" Industry

The Federal Council of Chuches of Christ in America had a word to say on March 16, when it issued a public statement urging both miners and operators to confer. On the same day the American Federation of Labor declared the cause of the miners was just and that the "great labor movement" of the country would lend its "undivided and unswerving support." The miners of District No. 2 in Pennsylvania issued a public statement asking the people of the land to demand that the government investigate "the hopelessly messed coal industry." Attorney General Daugherty's statement of March 25 said that he had assured operators and miners that no action under the Sherman law would be instituted by the government against anybody who might confer by groups on a wage scale and working conditions. Representative Bland of Indiana introduced a bill March 23 providing for a commission of three to be appointed by the President to investigate and report on the coal industry with the idea of curing some of the ills of the existing situation by publicity.

On March 21, without waiting for the finish of the miners' referendum authorizing it and without waiting for end of anthracite negotiations, President Lewis of the miners declared a strike effectitve at midnight March 31. The strike was to include all union miners in the United States and Canada except Nova Scotia, where there remained a shred of hope, and western Kentucky.

The Indiana operators scale committee, in two efforts to get a conference with Indiana miner officials, were unsuccessful. The committee framed up a proposed scale with a wage reduction running from 30 to 40 per cent and without the check-off. This scale had a clause in it providing for alterations in wages during the contract. The miners would not look at it. Central Pennsylvania, southern Ohio and Pittsburgh operators all invited their men to confer separately in those fields. The miners refused in central Pennsylvania and southern Ohio regions and simply failed to appear at the scheduled Pittsburgh meeting, leaving the operators sitting there alone. The miners of the Kanawha-Fairmont field met the operators but refused to negotiate.

Thus the country came to April 1 and crossed the deadline into a strike that was destined to run four months and fifteen days. Only the non-union fields, western Kentucky, whose union contract held until April 1, 1923, and Colorado, which was changing to non-union, continued to operate. The very first week in West Virginia the Pocahontas, Tug River, Kenova-Thacker and Logan fields were unaffected. Winding Gulf worked 90 per cent and New River shut down. About a dozen Kanawha mines went on working at the 30 per cent reduced wage scale. Eighteen out of 264 mines in the Fairmont region began working "open shop" while 17,000 men struck. A scattering few mines in northern West Virginia operated. Operations continued in the Upper Potomac region under a 90 day agreement pending an adjustment. In Pennsylvania the mines worked almost full in Connellsville, Uniontown, Johnstown and Somerset County fields. Northeastern Kentucky and southwestern Virginia worked regularly and about half the mines of Tennessee that were working during March kept on. The union centered its pressure upon all those fields. In the non-union Connellsville region the union finally almost shut down the field. Various government efforts were made to get miners and operators of striking fields together in conference. First Representative Nolan, of the House Committee on Labor, tried it. His invitation to the operators got no results worthy of the name. During the early days of April and up to the 10th the committee held hearings at Washington on the situation. This gave both miners and operators a chance to air their cases.

But the Law May Not Be Broken

Because the operators persistently declared the government would not permit a four-state agreement, citing the indictments brought the year before against 225 miners and operators at Indianapolis, Attorney General Daugherty made his famous trip to that city to talk with Federal Judge Anderson. It was supposed he went there to get the indictments quashed. He stayed two days and went away without a word. The indictments were not quashed.

By the middle of April the strike had slipped from front pages of the newspapers into more obscure positions. To counteract union efforts at disorganizing West Virginia fields that were at work, operators got a series of anti-union injunctions issued by Judge McClintic in the District Court of the southern district of West Virginia.

Before April 15, Representative Bland, of Indiana, brought in a new government fact finding commission bill extending the provisions of his previous bill. Two commission plans were suggested April 21 at a dinner of the Survey Associates in New York, one by Dr. Harry A. Garfield, Federal Coal Administrator in 1919, and Philip Murray, vice-president of the United Mine Workers. Dr. Garfield revived his 1919 suggestion for a commission for anthracite and a separate commission for bituminous, each to be supplied with complete statistics on cost of living by government agencies. Mr. Murray declared congressional action should end the strike and that a permanent commission be created to gather facts and work out policies for the coal industry. He said the miners would go back to work if Congress guaranteed the 1920 award of the Bituminous Coal Commission.

Resolutions by various miner groups to be loyal to their employers and posting of guards at some of the mines brought about the first rioting in the Connellsville region April 29. A mob attacked Tower Hill No. 1 mine, in the center of a coke territory the union had been trying desperately to organize. Two state police were shot and several men clubbed. Even women made a demonstration against the non-union men working at the mine. The state police squelched all this trouble.

Kentucky Coal Prices Climb

Early in May the Bland fact-finding commission bill was reported by the House Committee on Labor with modifications. Prices of coal, especially in Kentucky, had made such upward climbs along with general demand, that by the middle of May Secretary Hoover actively began his program of control that put real restraint on most fields thereafter.

On June 5 the Supreme Court's decision on the Coronado case proved an interesting topic in strike talk. The court reversed a previous decision of the Circuit Court of Appeals, Eighth Circuit, and held that the Coronado Coal Co. of Arkansas could not collect $600,000 for property damages in a 1914 strike, plus $25,000 attorneys' fees plus $125,000 interest from the United Mine Workers of the Arkansas district because the evidence did not prove that the union organization as a whole conspired to restrain commerce in violation of law. However the decision was important in that it made clear that unions can be sued "for torts committed . . . in strikes." The coal company asked a reargument.

Early in June there were various signs of a trend toward the ending of the strike. P. T. Fagan and William Petry, vice-presidents of the union in Pennsylvania and West Virginia respectively, declared in speeches that the strike would end by July 1. A small group of Ohio operators called on Secretary Davis at Washington, presumably urging a plan for quick settlement. But no miners would meet operators in district negotiations and the defections among operators were not important up to that time.

During the latter part of May and early June the union's grip on Connellsville appeared to weaken and at least 5,000 miners in central Pennsylvania went back to work during the last two weeks of May. In the Kanawha field, union since 1912, one-third of the total number of miners were working by June 20 at reduced wages.

By this time union officials, encouraged by a few northeastern Ohio operators, were feeling out the country with the idea of having a four-state wage conference with those scattered operators willing to make a scale. But Illinois and Indiana, once willing to meet, declared the time for that had passed. They would not take part in any four-state conference.

Numerous small disturbances occurred over the country. Attacks had been made so frequently upon little strip pits working in Indiana that finally a gang gathered and prepared to destroy the Drake mine near Terre Haute. Mrs. William Drake, wife of the mine's owner, stood off a crowd of 300 one night with a shotgun. Workers were attacked in Brownsville, in the Connellsville field of Pennsylvania, and injunctions were issued against strikers in the Scott's Run field of West Virginia and Somerset County, Pennsylvania.

Trouble in Utah, which had been brewing for two months with an occasional outbreak, finally developed into a big gun fight in Carbon County, the shooting up of a train and other violence which caused Governor Mabey to put the county under martial law. State troops in the field got the situation pretty well in hand and production increased some. The Governor warned operators he would not permit kiting of prices. Troops remained in the field until after the general strike was settled.

Miners Massacre Twenty-one

The massacre at Herrin, Ill., June 22 roused the country by its brutality and put the strike back on the front page of every newspaper. The Southern Illinois Coal Co., with a strip mine six miles south of Herrin, in "bloody" Williamson County, broke an agreement with the union and tried shipping coal with non-union labor under guard. A mob unhampered by local law officers, besieged the mine, took the 48 occupants in surrender and then shot and cut 21 of them to death in a barbaric orgy. The day before, President Lewis of the United Mine Workers had telegraphed that the strip miners ought to be treated like any other strike breakers. Officials of the state were charged with dereliction of duty.

In view of the fact that Williamson County is solidly union in its sentiments not an arrest was made for weeks. A coroner's jury blamed the coal company for the deaths and held nobody. Fear was in the hearts of the populace. But a special grand jury in September and October returned 416 indictments involving 72 men, charging murder, conspiracy to murder and like crimes. Most of the indicted men were rounded up at once. Many of them were union members and officials. The Illinois miners' union defended them and by a special assessment of 1 per cent of every Illinois miners' earnings beginning Oct. 1, a defence fund was raised. The state had no funds for such a special prosecution, so the Illinois Chamber of Commerce raised approximately $50,000.

The trials started in December after two months of difficult choosing of jurors. When the twelve men were finally seated in the jury box many of them were union miners and admitted contributors to the defense fund, which prompted observers to prophesy that no convictions could be obtained from such a jury. The state's case in the first trial—that for the murder of Howard Hoffman, one of the employees of the strip mine and one of the six tied by the neck in the Herrin cemetery—was in by Dec. 20 and the defense had put on a few witnesses when the court adjourned over the Christmas holidays, thus ending the case until the new year.

During late June the strike wore on apace. President Lewis, of the miners, conferred in Washington June 26 with the President and Secretary Davis, but no official announcement of results was published.

By July 1 the country's stocks had dropped to 20,000,000 tons of bituminous and no anthracite, and the consumption was estimated at 30,000,000 tons per month while production during June ran only a little over 20,000,000 tons. The United States Chamber of Commerce issued a warning that a coal famine was immediately ahead. All sorts of resolutions were introduced into Congress at Washington urging federal action to end the strike. Disturbances in western Indiana kept many small mines closed. The union established commissaries.

The first White House general conference of miners and operators started on Saturday, July 1, at the call of the President. Mr. Harding opening the conference by pointing out the seriousness of the situation from the standpoint of the American people and urging the two sides to come to an agreement. The conference remained in session all day Sunday. On Monday the session had accomplished nothing except that the operators proposed a redistricting of the country and district settlement by district arbitration boards to be appointed by the President. Disputes unsettled by July 15 would go to a national arbitration board. This the miners rejected and the session adjourned until July 10, the operators making it plain that if the miners did not agree to something by that time mines would be opened in various states for a test of industrial strength.

Orders a Return to Work

At the start of the July 10 meeting the President, perceiving that the conference was deadlocked, flatly proposed that the mines be reopened and the men go back to work, the old scale to be in effect until Aug. 10 pending the making of a new scale by that date by a commission of three operators, three miners and five representing the public, whose findings should hold until March 31, 1923. Anthracite operators, bituminous operators and miners each retired and considered the proposal all day.

It was freely said among operators that the President had called his conference at a most unfortunate time, for the miners had been practically beaten to the point of surrender.

The President, recognizing that both operators and miners were trembling on the verge of refusal, issued on July 15 a letter explaining his proposal further. This made no modification of the plan but appeared to indicate that a settlement on the old Central Competitive Field Basis was desirable and that the check-off should be continued.

The miners refused finally. The operators, after most vitriolic sessions among themselves, made a general reply, agreeing with the President upon the general principle of arbitration but permitting each group of operators to reply for itself. Most of the country in these separate replies accepted the President's plan, but Indiana and the unionized fields of Pennsylvania refused.

His efforts to settle the strike having failed, President Harding in disappointment on July 17 said to the operators: "I invite you to return to your mining properties and resume operations," a statement which caused a good deal of speculation as to its exact intent.

Order Is Promised at Last

The President wired twenty-eight governors to protect such operations as might resume. All but Governor Ritchie of Maryland and Governor Morrison of North Carolina replied favorably. Few if any operations started, however. The Governor of Michigan threatened to open a few mines to be run by the state. The union "would not permit it." Governor McCray of Indiana took over a poorly equipped stripping operation, surrounded it with a heavy guard and tried digging coal with little success. The little coal shipped to state institutions was said to have cost the state $20 a ton.

The most serious outbreak in a mining field except the Herrin massacre was an attack made July 17 by 300 men on the Richmond Mining Co.'s Clifton mine, near Cliftonville, W. Va., in which Sheriff Duval and five non-union men were killed. Weeks later 218 were indicted for this, 71 for first-degree murder. More West Virginia injunctions against interference with miners were issued at various towns. In Indiana masked and hooded Ku Kluxers beat up men at work.

During the first weeks of July President Harding was urged from various sources to have a coal investigation commission set up. A. M. Ogle, president of the National Coal Association, wired July 23 asking that a non-partisan board be put to work at once gathering facts.

By this time prices of certain coals, especially those of western Kentucky, where operators had refused to

abide by Hoover prices, had hiked skyward. Western Kentucky mine-run began leaping upward as much as $1 a day to $12 a ton and the market was demoralizing. Then the government's plan for controlling car supply under the direction of Secretary Hoover and the Interstate Commerce Commission went into effect.

By July 20 acts of violence had become so frequent in parts of Pennsylvania that Governor Sproul sent state troops into Washington, Westmoreland, Cambria, Indiana and Somerset Counties. In West Virginia the state authorities said they had unearthed a plot for a campaign of frightfulness against non-union miners following the attack on the Cliftonville mine. A train of miners was dynamited in Boone County.

About Aug. 1 strike developments began to take a definite turn. In Illinois, Frank Farrington, state president, first agreed to revive the question of state negotiation and called a state union convention to authorize it. Then he suddenly called it off and hurried to Philadelphia for the conference which President Lewis called with all his district presidents. While miners were returning to work in larger numbers in central Pennsylvania, the troop-guarded Pittsburgh region improved not at all.

President Lewis called a meeting to be held in Cleveland Aug. 7 of miners' representatives and operators of the old four-state field, evidently feeling that enough operators were ready to sign the dotted line so that such a conference could be held. When Lewis' invitation to this meeting went out the operators of Illinois held a meeting Aug. 4 proposing to President Farrington that the 92,000 miners of that state go back to work at the old scale pending arbitration, which was almost exactly the proposal of President Harding to the operators of the country. Farrington replied he could do nothing until after the Cleveland meeting.

All Invited but Few Came

So many groups of operators declined to go to Cleveland that the conference merely marked time for the first several days. Illinois, Indiana, Pittsburgh and southern Ohio all stayed away as the conference began. At the first session on Monday, Aug. 7, about 30 per cent of the four-state tonnage was represented and scattering operators from other fields. The Pittsburgh Vein Operators Association of Ohio was there, however, and Michael Gallagher, president of the association, was made chairman of the conference.

Even as the conference was making its inauspicious start a new element popped up. It was the Crews-Glasgow plan of settlement, worked out at Pittsburgh by Ralph Crews and W. A. Glasgow, attorneys for interests on both sides. The conference was adjourned in Cleveland for two days to give this plan a whirl, in the hope that more operators would be drawn in by its aid. Mr. Lewis was announcing day by day that he would not deal with a minority of Central Competitive Field tonnage but that more was surely coming in.

All that week Lewis held a skeleton of a four-state conference together in Cleveland while vigorous efforts were made to draw in more tonnage. Illinois and Indiana refused unless arbitration of the next wage scale was agreed to by the miners. They refused. This drove such northeastern Ohio interests out of the conference as Michael Gallagher and S. H. Robbins. A letter from President Harding supported the demand for arbitration.

Immediately a new conference was organized by the acceptance of representatives from central Pennsylvania, an outlying district, and other regions. The union was willing by that time to consider an adaptation of the Crews-Glasgow plan as worked out by T. H. Watkins who had been urging it from outside the conference for days. It provided for compulsory investigation and a fact-finding commission but not compulsory arbitration, which Mr. Watkins inveighed against. Thus the union abandoned its announced determination to deal only with the Central Competitive Field. Although all operators outside that field had been ejected from the conference the Thursday previous, on Monday, Aug. 14, they were taken in and the conference went into its final stage.

By evening of Tuesday, Aug. 15, the strike was broken. The contract negotiated provided that all signatories should resume mining at the old scale and conditions to March 31, 1923, as soon as they signed supplementary contracts. The other points in the agreement were:

(1) Participants of the conference agreed to send delegates to a Cleveland meeting Oct. 2 to appoint a commission of operators and miners to devise a method for future negotiations, to be reported back to the main conference Jan. 3, 1923.

(2) The Oct. 2 conference was to select a fact-finding committee.

(3) The conference participants agreed to meet Jan. 3 in conference to finally determine the method of future negotiations and to see that such negotiations were started by Jan. 8.

Come and Sign One by One

The signatories of this agreement at Cleveland were from scattered mining regions. Important ones in the central Pennsylvania field were Mr. Watkins' Pennsylvania Coal & Coke Corporation, the Clearfield Bituminous Coal Corporation and the Allegheny River Mining Co. These with several smaller operations signed up at once and went to work while 200 other operators in the same field held off for several days before they surrendered. The Southern Ohio Coal Exchange left the matter to its individual members to do as they liked. Eventually they all signed. In northern West Virginia the Consolidation Coal Co. and 50 others lined up on Aug. 17 while the remainder held out for a while. Many mines stayed on an open-shop basis. Georges Creek operators met Aug. 18 and refused to recognize the union. Connellsville operators also refused. The Pittsburgh operators held out defiantly after most of the country was working but capitulated Aug. 29. The following day the Pittsburgh Coal Co., acting independently, also signed.

After days of deliberation with President Farrington of that state, Illinois finally signed on Aug. 22, but would not agree to attend the Oct. 2 conference or make any other promises for the future except to resume mining at the old scale until March 31, 1923. Indiana deliberated awhile also, in an effort to find some way to avoid swallowing the union's entire dose, ending up by signing but not "approving" the Cleveland agreement. The Southwest followed on Aug. 23. On Aug. 28 British Columbia and Alberta made the Cleveland settlement but western Canada had to accept a 15-per cent wage cut.

Thus the bituminous coal strike ended in almost complete victory for the miners' union. The union maintained the existing wages and working conditions, the apparent dissolution of the Central Competitive Field was not necessarily final and the union had staved off wage arbitration.

Always Ready to Try Again

The Nova Scotia dispute, mainly between the British Empire Steel Corporation and its coal miners, which ran from Jan. 1 on, was not settled until two wage commissions had made their findings and an upheaval had taken place within the union of the Nova Scotia district. A board of conciliation headed by U. E. Gillen recommended a wage cut running from 12½ to 20 per cent in February. The union rejected this but some men went to work under the award. District Secretary-Treasurer J. B. MacLachlan advised them to "soldier" on their jobs. Chairman Gillen and another member of the conciliation board resigned and a new board took up the case, with D'Arcy Scott as chairman. On May 5 this board recommended a 20-per cent wage reduction. The miner minority, however, recommended an increase of 60 cents a day to $3.45. The district convention of miners refused to accept the majority recommendation though President Baxter of the district approved it. Baxter was charged by MacLachlan with "selling out" the union. He charged MacLachlan with bolshevism.

In August the men of the whole district struck. The companies offered an increase from $2.85 to $3.25 and a 10-per cent increase in contract rates, which the union demanded be increased 20 per cent. On Aug. 25 the companies finally raised the contract offer to 12½-per cent increase and the strike ended in some mines. Meantime, President Baxter had been beaten in a district union election by Dan Livingstone, who lives outside the district, and the radical element gained complete control of the district organization. On Sept. 18 the district settled complete with all operators on the $3.25 scale.

Immediately upon the settlement of

the strike in the United States upon the Cleveland basis, the Pocahontas Operators' Association advanced wages in their territory to the 1920 scale, thus putting the whole of southern West Virginia back on a war-time wage basis. It was estimated that the union had lost 25,000 members in West Virginia during the summer. In the Kanawha, Georges Creek and Upper Potomac regions the anti-union basis of employment was maintained in spite of violence and intimidation, which was held partly in restraint by injunctions.

On Sept 22 the government's fact-finding commission bill passed, so that when Oct. 2 rolled around and the second Cleveland conference of operators and miners started the plan for setting up a miner-operator fact-finding board was practically stalled.

"Peace" was the keynote of the Oct. 2 conference. In spite of previous refusals to agree to attend, operator groups from fifteen mining districts, covering practically all union bituminous territory, were there. The first day there was much violent disagreement between operator groups, especially against such leaders as T. K. Maher, Thomas H. Watkins and W. H. Haskins, who were credited with making the Aug. 15 settlement with the union possible. A peace address by President Lewis, of the miners, delivered in joint session appeared to have a soothing effect. He appealed to both sides to "bury the hatchet" in the interest of the industry and all concerned with it, indicating an astonishingly friendly spirit on the part of the union.

Although Mr. Maher was chairman of the original Cleveland conference, Phil, H. Penna, of Indiana, was made permanent chairman of the second one. Mr. Haskins, in an early meeting of the operators at the conference, made a fiery speech, declaring the "little group" which broke the strike on Aug. 15 intended to stand by the Cleveland agreement even if no other operators did, but when it became evident among the operators that the meeting was not going to be dominated by a "small minority," they all went into it and in three days the business was done.

Action of Conference

The conference did these five things:

(1) Created a "reorganization committee" of two miners and two operators from each of the fifteen mining districts represented.

(2) Instructed this committee to work out a method for future wage negotiations which may or may not be adopted.

(3) Instructed the committee to begin work in Chicago Nov. 14 and report to the whole conference Jan. 3, 1923.

(4) Did not set up a fact-finding commission but deferred to that of the government.

(5) Operators declined to comply with a request from Washington for a panel of twenty names suggested by the joint conference as possible members of the government fact-finding commission. The miners, however, suggested ten.

Before the conference ended the miners' scale committee announced that it would demand the platform laid down by the union convention of Feb. 14, that is, maintenance of the present scale of wages and insistence upon the adoption of a five-day week, a six-hour day, time and a half for overtime, double time for Sundays, and some other contract changes. This was regarded by the operators as not exactly bearing out the peaceful position taken by President Lewis when the conference opened.

On Oct. 7 martial law was lifted in Mingo County, West Virginia, after fifteen months. It had been established June 27, 1921, when war between union and non-union miners had grown so violent as to require federal troops. Late in October the union gave up the fight to get ousted union men back into the mines and moved them away.

"Outliers" Want Voice

When the "reorganization committee" selected at the Cleveland conference met in Chicago, Nov. 14, a battle was started at once by the outlying districts trying to win a voice in whatever method of wage negotiations the committee might recommend to the main conference. Both H. N. Taylor, of Kansas City, and C. H. Jenkins, of Fairmont, W. Va., proposed plans for making a national wage scale from which variations could be arranged by districts. Also national arbitration was proposed in various forms. The operators' half of the committee could not agree upon anything and the union would not entertain any arbitration suggestion. So the first session of the committee accomplished nothing and adjourned after four days of it, to reconvene Dec. 6.

When the operators' half of the committee assembled two days before the whole conference, it failed to agree upon the four-state plan which was expected to be adopted. Instead it worked out a proposal for district settlements, with a sliding scale of wages and arbitration by either a non-partisan board to be appointed by the President of the United States or a board made up of miners, operators and public representatives. The union would have none of this, so the committee adjourned a second time. It expected to meet for a final word an hour before the main joint conference assembled in Chicago Jan. 3, in the hope that something might happen in the meantime to make it possible for the committee to report something better than complete and absolute failure to agree upon any future method of negotiation.

On Dec. 13 the United Mine Workers essayed a stir by inviting the United States Coal Commission to probe conditions in Logan County, West Virginia.

Although there were many who would have liked to see the United States Coal Commission mediate in the coal industry's wage tangle, the commission made it plain late in December that it did not expect to overstep its fact-finding limitations. Thus the industry entered the year 1923 with no definite plan for putting its own house in order and for avoiding another strike.

Bituminous Coal Production, Mine Price and Index, by Weeks, 1921-22

Week Ended	1921 Production (Net Tons)	1921 Average Mine Price	1921 Coal Age Index	1922 Production (Net Tons)	1922 Average Mine Price	1922 Coal Age Index
Jan. 7	9,633,000			7,476,000	$2.29	189
Jan. 14	9,936,000			8,302,000	2.29	190
Jan. 21	9,184,000	$3.26	270	8,782,000	2.22	183
Jan. 28	8,570,000			9,620,000	2.21	182
Feb. 4	8,132,000			9,714,000	2.21	182
Feb. 11	7,859,000			10,309,000	2.22	183
Feb. 18	7,489,000	2.77	229	10,285,000	2.20	182
Feb. 25	7,432,000			10,402,000	2.18	180
Mar. 4	7,278,000			10,541,000	2.17	179
Mar. 11	6,900,000			11,102,000	2.16	178
Mar. 18	6,512,000	2.63	217	10,843,000	2.10	173
Mar. 25	6,457,000			11,448,000	2.05	170
April 1	5,822,000			10,469,000	2.06	171
April 8	6,120,000			3,835,000	2.19	181
April 15	6,528,000	2.62	217	3,656,000	2.23	184
April 22	6,815,000			3,575,000	2.49	206
April 29	6,984,000			4,175,000	2.67	221
May 6	7,391,000			4,164,000	2.78	230
May 13	8,009,000			4,433,000	3.16	261
May 20	7,989,000	2.68	222	4,481,000	3.67	303
May 27	8,166,000			4,889,000	3.25	269
June 3	6,835,000			4,616,000	3.08	255
June 10	8,010,000			5,136,000	3.44	284
June 17	7,551,000	2.52	208	5,013,000	3.31	274

Northwest Is Saved from Suffering When Uncle Sam Strikes Great Lakes Shipping Into Action

Coal Distribution System Demolishes Obstacles and Delivers Four-Fifths Normal Supply of Bituminous in Spite of "Impossibilities"—Region Gets Only One-Third Enough Anthracite by Lake Route, However

"THE heroic rescue of the Northwest" might well be the title of the story of coal shipping on the Great Lakes in 1922. The history of the season is a tale of obstacles choking off the stream of fuel for the states about the upper Lakes, of how that great region called to the government of the United States to give it coal, and of how the Hoover coal administration hacked a way through the obstacles and delivered the coal. In spite of a miners' strike which shut every mine through half the season of navigation, in spite of a railroad strike which hamstrung roads that should have dumped non-union Lake coal all summer, in spite of political and commercial opposition, and, finally, in spite of a Lake seamen's strike at the height of an autumn burst of vessel transportation, still the Lakes got 18,522,142 tons of soft coal, which is but 3,866,213 tons short of the record 1920 total of 22,408,355 tons of cargo coal. It is true the Northwest got less than a third of its normal Lake supply of anthracite—the total dumped at Lake Erie ports being only 1,070,680 tons, which is far short of the 3,810,315 tons of 1921—but it was supplied with its fuel necessities. The luxuries it may get by rail.

Year Opened with Big Stocks

Docks were piled high and 500,000 tons in winter cargoes lay alongside when 1922 opened. At first there was a shiver of uncertainty among dock men because the volume on hand was so mountainous. Cold weather of February boosted prices an average of 50c. a ton on bituminous, and demand became so keen that the apprehension was removed. The certainty of a strike April 1 made the carry-over of 3,500,000 tons of soft coal and 416,000 tons of anthracite at Duluth-Superior and other large stocks at Milwaukee seem only a comfortably large amount. The Northwest at once assumed an air of confidence because of these huge piles and at first refused to worry about the strike in its early weeks. This very confidence later led to the shipment of a good deal of coal from the Head-on-the-Lakes docks back along the other lake ports. From Duluth-Superior alone 229,000 tons was shipped out at various times.

The first Lake vessels ventured out of lower Lake ports April 11, opening the season. Dumpings were a little above 200,000 tons a week at the start. This was a great improvement over 1920 and 70 per cent of 1921. The first week of May saw an improvement to 250,000 tons, most of which went to lower ports, as the upper region was so full of coal. The week of May 22, the dumpings passed 300,000 tons for the first time, but the demand from Buffalo steel and coke plants was losing much of its insistence and the last week in May dumpings fell off to 250,000 tons again. By June 1 the total Lake movement up to that date was just under 2,000,000 tons, as compared with a little over 5,000,000 tons up to that date the year before. In other words, Lake shipping was only two-fifths of normal.

During June the Lake Superior Northwest awoke to the fact that its mountainous dock stocks were dwindling fast—shipments off the docks had started at the rate of 9,000 cars for April, which was a little above the average, and had accelerated more swiftly than the general public realized, for industrial consumers were buying—so Northwest inquiry for coal began to come in heavily. Only 247,000 tons was shipped through the "Soo" canals to Lake Superior ports during June and this dropped in July to 172,000, which was enough to send a fright through the whole region, as the railroad freight rate decrease on July 1 had not produced the flow of coal expected. Instead, July 1 had brought an increase of 50c. a ton on most coals at the Head-of-the-Lakes, which offset any benefit from the 35c. freight cut.

BITUMINOUS CARGO COAL LOADED INTO VESSELS AT LAKE ERIE PORTS
(Net Tons)

	1920	1921	1922
Season to Apr. 30	301,572	1,242,772	802,641

December	256,804	67,397	508,052
Totals	22,408,355	22,412,380	18,522,142

June dumpings had been more or less encouraging. They had totaled 3,712,000 tons, which was within 200,000 tons of June, 1920, though 600,000 tons short of 1921—a year in which Lake shipping had started off at a pace much faster than usual. The month of June had shown an advance of 1,540,000 tons over May, and there was hope of increasing the flow of non-union coal to Lake Erie. But just then the rail strike cut in. Rail congestion at junctions all the way from the coal fields to the Lakes, and stronger industrial demand growing up in other parts of the country to divert coal from the Lakes combined to drop dumpings toward the very bottom.

Panicky feelings began to keep the Upper Lake territory awake nights. Demand everywhere in the country was strengthening, prices were getting out of hand and had crossed the Hoover deadline on their way up, and the Head-of-the-Lakes commercial supplies were less than 550,000 tons of bituminous and 250,000 tons of fine anthracite. Total receipts for the year to July 1 at Duluth-Superior had been but 288,000 tons, as compared with over 4,000,000 tons up to that date in 1921.

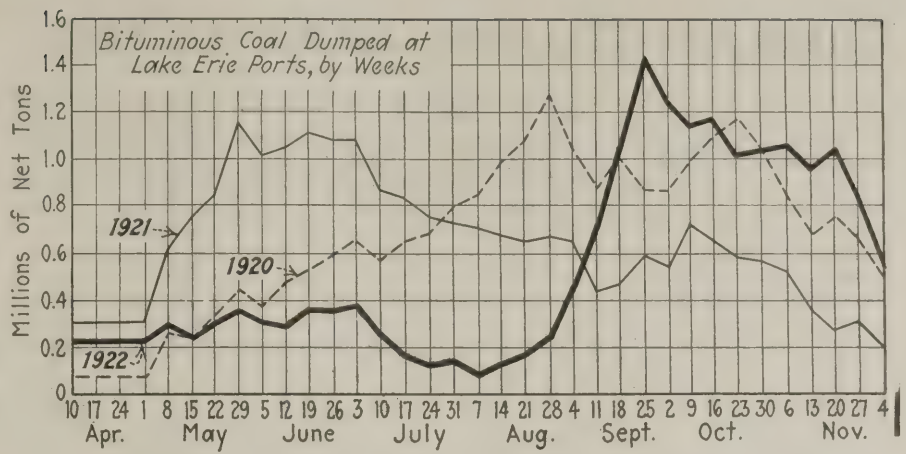
July dumpings at Lake Erie ports slid down. Approximately 140,000 tons "went over" during the week ended the 24th with disastrous effect upon the Northwest. Bunker fuel scarcity forced cutting of ship schedules. Vessel receipts on Lakes Superior and Michigan by Aug. 1 totaled a trifling 2,866,742 tons, which was only 11 per cent of the requirements of the ports around those lakes. In 1921 the same ports had received by Aug. 1 a total of 21,677,513 tons. Up to Aug. 1 in the years 1917 to 1919 the average had been 26,130,000 tons.

The Northwest began to get desperate. It lifted up its voice in loud and mournful wailing with a distinct note of hysteria predominating at times. The government's fuel distribution system was set up just then with Henry B. Spencer as Fuel Distributor. The Northwest rushed at him almost before he had had time to get to his office the first morning. Some effect of previous pleading was noticeable in Service Order 23, issued July 25 by the Interstate Commerce Commission setting forth coal priorities for shipment. Class 1 was "for such special purposes as may, from time to time, be designated by the Commission." The Northwest did its best to get into Class I but landed in Class 3: "(As to each coal-loading carrier which reaches mines in Pennsylvania, Ohio, West Virginia, Kentucky, Tennessee, and Alabama)—For bituminous coal consigned to any Lake Erie port for transshipment by water to ports upon Lake Superior."

Washington authorities made a Northwest survey and announced it was still possible to supply that region before the end of the lake season with coal barely sufficient to meet its minimum needs, provided shipments started by Sept. 1. Early in August it was arranged that cars for contract shipments to upper Lake ports should be supplied and that the shipments should be through the agency of the Ore & Coal Exchange at Cleveland. However, Lake dumpings the first week in August dropped to the "new low" of barely 92,747 tons. This was the absolute bottom. A steady improvement followed. The Fuel Distributor agreed

tentatively that henceforth at least 250,000 tons a week should be supplied for the upper Lakes alone if it could be obtained.

The settlement of the strike Aug. 15 at Cleveland, and the reopening of a large number of mines in Ohio the day after, had a noticeable effect on Lake dumpings as early as the week of Aug. 21, when the total climbed to 162,000 tons, of which 28,000 tons was bunker fuel. Lake shipping was behind about 10,000,000 tons by that date and peculiar distribution giving Lake Erie ports about eight times as much as 1920 and Lake Superior ports only 16.5 per cent of the total instead of the 36.5 per cent they got in 1920 and 51.4 per cent in 1921 made Lake Superior's plight striking. Lake Michigan ports up to that time had obtained 41.3 per cent of the season's dumpings, as compared with 23.5 per cent two years before. From July 1 to Aug. 1 stocks of bituminous coal at Duluth, Superior, Ashland and Washburn, on Lake Superior, had dropped from 1,498,000 tons to 661,000 tons and anthracite from 364,000 to 170,000 tons.



In view of all this the Fuel Distributor directed that on Monday, Wednesday and Saturday of the last week in August all coal loaded in the Kenova-Thacker, Logan and Kanawha fields on the C. & O. and in the Big Sandy, Elkhorn, Hazard and Harlan fields should go to the Lakes. The week's total dumpings went up to 258,898 tons, which was the first time the promised 250,000 tons had been delivered. The succeeding week the total reached 340,000 tons.

Priority Given to Lake Shipments

In order to improve the Lake situation further Lake shipments were put in priority Class 1. A pool was formed as during the war in the effort to get coal moved more quickly. Regardless of the complaint of poor quality which later arose in the Northwest over coal handled through this pool, shipments did increase, though Northwest dock reserves got down to 303,000 tons of bituminous and 92,000 tons of hard coal.

By Sept. 1 distribution of Lake cargo coal loaded at Lake Erie ports began to assume more normal proportions, even though totals were pitifully small. By that date loads for Lake Superior ports totaled 5,025,210 net tons, or 47.13 per cent of the Lake total to date. The total for those ports the year before to Sept. 1 was 9,486,736 tons. The grand total for the Lake ports to Sept. 1 was 10,662,526 tons, as compared with 15,840,744 tons the year before and 5,161,218 tons in 1920.

On Sept. 22 President Harding signed the Coal Distribution Act and soon thereafter Conrad E. Spens took office as Federal Fuel Distributor with Donald Conn, of Minneapolis, Minn.; C. P. White, of St. Paul, Minn., both Lake coal specialists, and H. M. Griggs, of the Ore & Coal Exchange, on his staff of assistants. Hope was expressed that 15,000,000 tons could be moved up the Lakes before the end of the season.

Lake Erie dumpings boomed upward during September with a high mark of 1,453,684 tons the week ended Sept. 24. This was a record week in the history of Lake shipping. At last Lake traffic was going full blast. But the fast gait could not be maintained. The very next week dumpings dropped to 1,241,086 tons.

Bituminous dumpings all through October were maintained above the million ton mark by main strength and government assistance, in spite of the Lake season's strike Oct. 1. Public utilities were asked not to stock any until the Lake season had closed. By Nov. 5 the bituminous movement for the season had been 15,577,786 tons. In the same period of 1921 the total was 21,972,375 tons. The last week in November saw dumpings slumping. In that week 812,117 tons was loaded at Lake Erie ports. An extension of the season was announced, mainly to permit more anthracite to get through. The "Soo" canals were kept open until Dec. 20, though there was little shipping of coal after Dec. 15. Duluth's season ended four days before that.

During the week of Dec. 11 dumpings totaled 288,869 tons, which was high for that time of year. This brought the season's total dumpings to a point a little in excess of 18,500,000 tons, which was approximately 4,000,000 tons behind the 1921 mark.

The anthracite mines began producing Sept. 12 and a little anthracite soon after appeared at Buffalo for shipment. This did not amount to much until October, however. In that month 267,744 tons went through the "Soo" canals for Lake Superior ports. In November the canals passed 281,746 tons and in December 97,000 tons, making the 1922 anthracite total for that lake, 670,447 tons. The total anthracite Lake dumpings during the week ended Oct. 23 were 153,553 tons, but they decreased during the next few weeks to less than 100,000 tons per week, only to spurt upward the middle of November to a high week of 151,000 tons and then down again. The December total to the close of navigation Dec. 15 at Buffalo was only 123,600 tons and the season total dumped there, 1,070,680 tons as compared with a 1921 total of 3,810,315 tons.

The Northwest, with only one-third of the usual anthracite receipts by Lake, was left to patch out its winter supply of anthracite by rail if it could. Milwaukee got only 314,253 tons of anthracite by vessel all season, which was 709,392 tons short of the 1,023,645 tons it got the year before. The Head-of-the-Lakes got 544,487 tons instead of 1,844,642 as in 1921. Practically all of this dock coal went to dealers as soon as it was received, so that the Lake supply sank out of sight quickly after the last boat had unloaded and it was estimated the last of it would be in householders' hands by Feb. 1, leaving no carry-over whatever for the spring of 1923.

Even though the superhuman efforts of the government and shippers toward the end of the navigation season brought the Northwest's total up within sight of the total of 1921, and it seemed that the upper Lake states certainly should feel no need for soft coal, yet it was estimated that only 700,000 tons were "free" on the Duluth-Superior docks, though the total on the docks was 2.765,924 tons compared with 5.663,477 tons as the end of the previous season. While Duluth docks contained 145,092 tons of hard coal when the last ship had unloaded, every ton of it was sold. In 1921 the carry-over there was 416,000 tons of anthracite and 3,500,000 tons of bituminous.

The Duluth total receipts for the season were 5,705,296 tons. The average for the past five years had been 10,104,828 tons there. Thus the Head-of-the-Lakes got half enough coal. Milwaukee got a better proportion. Its Lake total for 1922 was 2,330,507 tons of soft coal, which was only 243,867 tons short of 1921, but it got only 314,253 tons of anthracite, which was 709,392 tons short. The season total which passed through the "Soo" canals was 8,790,571 tons of soft and 670,447 tons of hard coal as compared with totals of 12.507,027 tons and 2,256,128 tons in 1921.

Following are revised figures giving the receipts of coal from all sources at Milwaukee during the year 1922:

Received by	Anthracite Tons	Bituminous Tons	Total Tons
Cargo vessel	360,070	2,331,407	2,691,477
Car ferry	108,620	272,664	381,284
Rail	879	428,805	429,684
Total, 1922	469,569	3,032,876	3,502,445
Total, 1921	1,168,625	3,623,086	4,791,711
Decrease	699,056	590,210	1,289,266

Tidewater Business Suffered Severe Shrinkage in 1922

Dumpings Into Vessels Drop 25 Per Cent from 1921 and Nearly 50 Per Cent from 1920—Exports Make Woeful Showing—Imports Increase Notably

By J. S. Burrows*

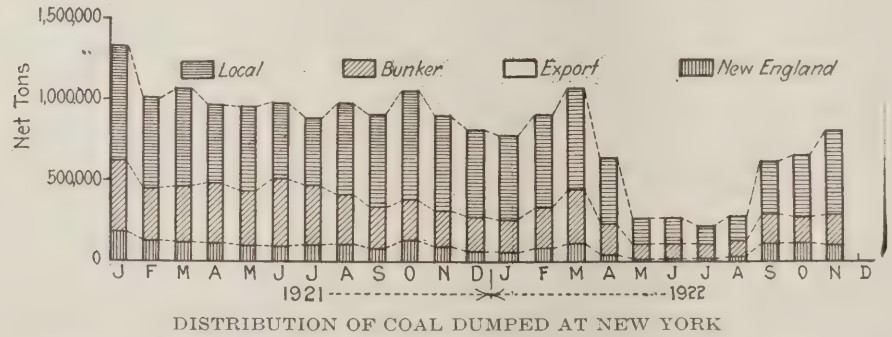
TWENTY-EIGHT million net tons of bituminous coal were dumped into vessels at the principal Atlantic ports in 1922. This comparatively small volume of tonnage represents but 75 per cent of the coal dumped in 1921 and slightly more than half of the peak tonnage of 1920, when our export business was so large. While the miners' and shopmen's strikes deserve first consideration as the cause of the loss of tonnage during the past year, actually had our export business and its attendant bunker requirements been as good in 1922 as in the previous year, there would not be the 25 per cent deficit in dumping which the figures reveal and in all probability 1922 would have been a better year than 1921, nothwithstanding the strikes.

In view of the curtailed production it might be imagined that there was not sufficient coal to export in 1922, which, however, is not the fact, for, bearing in mind that the bulk of our export business moves through Hampton Roads ports, which are served by non-union mines, there was coal available for export up to the last quarter of the year and a large surplus of tonnage during the first half.

Tidewater export business in the past year makes a miserable showing of 1,500,000 tons as compared with 9,600,000 tons in 1921 and over 21,000,000 tons in 1920. It is on account of this great disparity in the export division of the year's statistics that the entire subject is approached from the export angle rather than from the losses due to the great strikes.

Because of the strikes, however, the United States became a considerable importer of coals in the last half of the year, so that when a balance is struck between the quantity of coal that was exported overseas from the Atlantic seaboard and the quantity of coal that was imported from overseas at Atlantic ports an excess of several million tons of imported coal will be found. This was the second great factor in the Tidewater business of 1922. When, during the strike period, scarcity of coal enhanced prices to about $7.50 at Hampton Roads, British shippers were able to deliver cargoes of Welsh coal alongside New England wharves and in New York harbor at about the price on cars at Hampton Roads, thereby saving to buyers the cost of freighting from Hampton Roads to port of delivery. In most cases the British coal could be bought at from a dollar to a dollar and a quarter under the price of American coal.

No better illustration than this importation of British coal could be found to explain why our export business languished during the past year. Owing to the high cost of production and resulting high prices for American coal, plus our inability to maintain a competing merchant marine, the foreign buyer of coal has been going to England instead of the United States for his supplies. Nor has Great Britain lacked sufficient coal to meet this world-wide demand. Her coal industry, on which she is vitally dependent as a merchant nation, has made a most remarkable recovery despite the dire predictions of a year or so ago. While we shipped last year 1,500,000 tons of export coal, Great Britain exported nearly 65,000,000 tons, which is within 10 per cent of equaling her record pre-war year. This also shows that there has been a considerable market for coal abroad in which the United States has not been able to compete.



The loss of export business and the bringing of British coal to our shores are the outstanding features of the Tidewater business of 1922. The other divisions of Tidewater tonnage were affected largely by strike conditions.

Bunker business was nearly cut in half, less than 4,500,000 tons being supplied. This business increases or decreases with export trade but the great-

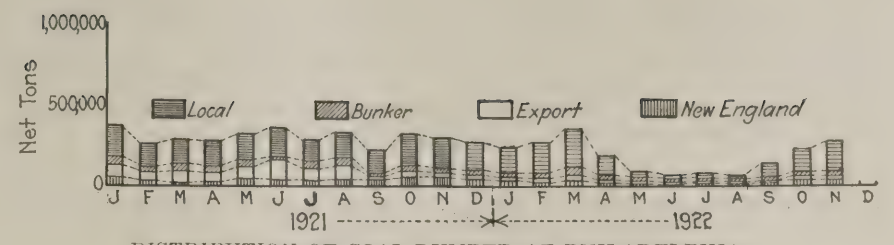
DISTRIBUTION OF COAL DUMPED AT NEW YORK

COAL DUMPED AT THE THREE HAMPTON ROADS PIERS

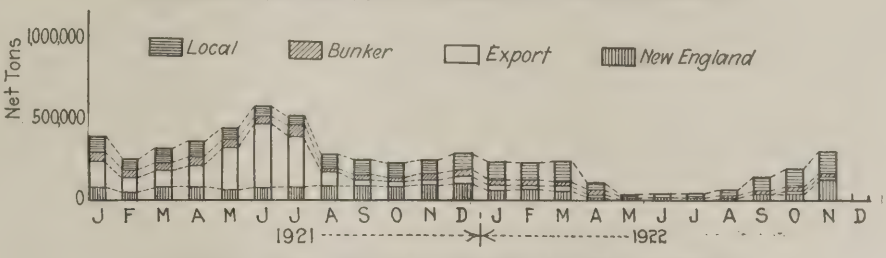
est loss was due directly to the strike shortage of coal at New York, Philadelphia and Baltimore, and to the fact that steamers avoided coaling in this country as much as possible during the strike period. During the time of greatest scarcity steamers in New York were bunkered with coal shipped from Hampton Roads, more than a million tons being shipped to New York harbor from the Southern piers. This coal does not show in the bunker dumpings but partly accounts for the great increase in the division of "other tonnage" at Hampton Roads.

It will be noted at Hampton Roads that so-called "other tonnage" jumped from less than 750,000 tons in 1921 to about 3,500,000 tons in 1922. Hampton Roads became the emergency fuel station of the Atlantic coast cities during the strike and Pocahontas and New River coals were shipped in considerable quantities to Baltimore and Philadelphia as well as to New York.



Total dumpings of coal for New England at all ports amounted to 10,750,000 tons, an increase of nearly 2,000,000 tons over 1921. This is surprising in view of the fact that the New England railroads bought during the late months of the year enough British coal to take care of their full requirements. Reserve stocks of coal, however, had nearly been wiped out during the strike and British coal may be regarded as replacement of reserve while the tonnage from Atlantic ports indicates about the average yearly shipments.

The individual ports fared variously throughout the year according to the extent of their dependence on union or non-union mines and the transportation conditions on the railroad serving them. Hampton Roads piers were least affected by the strike and were the main beneficiary of strike losses at other ports. Hampton Roads dumped 60 per cent of the total tidewater tonnage in 1922 as compared with 46 per cent in 1921 and 45 per cent in 1920, a record year.



New York, the second largest port, dumped 25 per cent of the total tonnage in 1922 as compared with 32 per cent with 1921, a decrease of over 4,500,000 tons. Philadelphia dumped only 8 per cent of the total tonnage, as compared with 10 per cent in 1921, and Baltimore had 6 per cent, as compared with 11 per cent in 1921. The actual decreases in tons are shown in the accompanying summary.

As might be expected, prices of coal at Tidewater fluctuated widely throughout the year, influenced to a great extent by artificial causes during most of the strike period. Such influences which interfered with the law of supply and demand were the "Hoover fair prices," generally agreed to by the producers in most of the coal fields; propaganda on the part of the press as well as influential trade associations to prevent a panic of buyers, and the power delegated to but not used by the Interstate Commerce Commission to withhold cars from profiteering shippers.

smokeless coal at Hampton Roads and Pool 9 coal at New York as typical examples of price fluctuation, prices were fairly constant at $4.50@$4.75 per gross ton at chutes for smokeless coal until April 1, with Pool 9 selling at $5.75@$6 per gross ton alongside in New York Harbor during the same period. The effect of the miners' strike was not felt until late in April, when southern smokeless sold at $5 and Pool 9 advanced to $6.50. Many saw a big advance in the New York market as union coal became scarcer and Pool 9 shot up to $8.50 while southern smokeless was beginning to feel the increased demand and went to over $7.

Prices slipped back somewhat in June but went up again in July, at the end of which month southern smokeless sold as high as $9.50 and Pool 9 reached $12. The highest prices of the year were reached in August, during the time of greatest stringency, when southern smokeless was sold at $10@$11 and Pool 9 at $12@$13. The settlement of the miners' strike naturally brought about a recession in prices during the early fall months, southern smokeless getting back to $7.25@$7.50 by the middle of October with Pool 9 at $8@$8.25.

With some further recessions of 25c. or more and some quick advances during the holidays the year 1922 closed around $9 with a strong market in prospect for the opening of year 1923.

Destination of Bituminous Coal Shipped to Tidewater In 1922, by Months

Engineering Profession Entering New Era, Says Dean Cooley

The engineering profession is on the eve of great developments, Dean Mortimer E. Cooley of the University of Michigan, declared in his address to the American Engineering Council of the Federated American Engineering Societies at the annual meeting of the Council held at the Cosmos Club in Washington, Jan. 11-12. Dean Cooley, who was unannimously re-elected president of the Council for 1923, struck the keynote of the gathering in saying: "We are, I feel, entering upon a new era. The engineer, not so much in the technical as in the social sense, is about to take that part in the world which rightfully is his. I am speaking not of civil engineering, mechanical engineering, chemical engineering, electrical engineering or any other branch but of engineering as a whole.

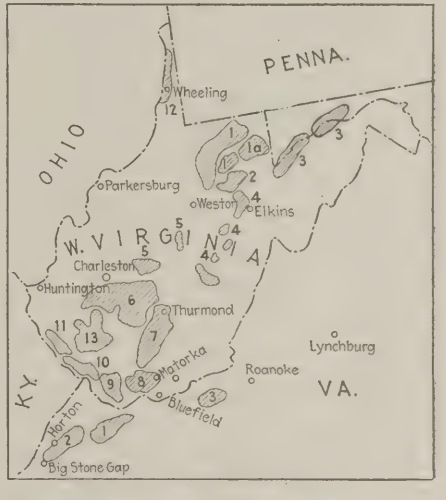
Reviewing the year's work, Dean Cooley said that substantial results had been achieved, and that the Federation was progressing gradually and surely toward the fulfillment of its mission. His trip through eighteen states last spring, he said, inspired the conviction that the Federation was a necessary instrument of organized engineering and a source of opportunity for service both within and without the profession that exceeded the hopes even of its founders. The waste report and the report of the two-shift day in continuous industry he characterized as two outstanding accomplishments of world importance. A third undertaking of similar magnitude was likely to be set in motion in the near future, Dean Cooley announced.

Dean Cooley enumerated many activities in which the Federation might utilize the services of the engineer for the national good. Transportation he mentioned as a field for possible engineering effort through the Federation, whose work in reforestation, delayed by illness in the familiy of the committee chairman, would soon be constructively resumed.

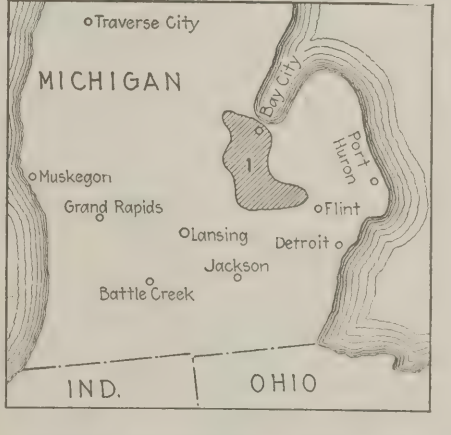
Where Coal Originates and Where It Goes

Every Coal Field in United States Shown in Maps—Railroads Reaching These Fields and Market Areas Served Are Given in Tabulations

By Wayne P. Ellis



THE accompanying outline maps of coal producing fields, with the index of names and railroads serving each, were originally prepared by the Car Service Division of the American Railway Association. A few changes have been made in the outlines and railroads and there has been added for each producing field the principal market territory now being served by it.



No maps are shown for the territory served by coal moving coastwise from Atlantic seaboard ports nor via Lake from Eastern producing fields through lower Lake Erie ports. The Atlantic coastwise movement is principally to New England, while the Great Lakes movement ultimately reaches destinations for the most part located in Michigan, Wisconsin, Minnesota and Ontario, Canada, and even as far west as the Dakotas.

The market territories from each district of origin for the most part can be clearly outlined, as the same general territory has been served for a number of years. Freight rates and mine costs have limited the sales territory in normal years through competition between fields producing similar quality coals suitable for general steam use. Due, however, to the rapid development of the byproducts coke industry and other consumption needs requiring special grades of coal there has resulted in recent years, an increased demand for and increased transportation haul of special high-grade coals produced only in certain districts, which are, generally speaking, the most remote from the market centers. Mention is made of this fact only to explain, in part, the reason for the widespread distribution of coal produced in southern West Virginia and eastern Kentucky.

WEST VIRGINIA

Map No.	Producing District	Originating Roads	Market Territory
1 and 1a	Fairmont and Cumberland-Piedmont	B. & O., Mong., Mong. & Wheeling and W. Va. Mid.; West. Va. Northern, Morgantown and Kingwood	Eastern Ohio, including Lakes, Northern West Virginia, Maryland, Eastern Pennsylvania, Southeastern New York, New Jersey, Delaware and New England including tidewater.

7	Evanston (Unitah Co.)	Union Pacific	Wyoming, Utah, Oregon and Washington.

British Columbia Output Gains

By Robert Dunn

The coal output of British Columbia for 1922 should be approximately 150,000 tons better than it was in the previous year. Up to the end of October, according to monthly returns submitted by the collieries, it had totaled 2,120,637 tons. Official returns for the whole of 1921 show a production of 2,628,672 tons. Thus, if the output for November and December average 250,000 tons, the aggregate will be, as stated, a little better than it was in 1921. It should be remembered, however, that usually there is a shrinkage when the annual compilation is compared with that arrived at every month. For this reason it is not safe to say that the official statistics, when issued, will show that the past year has improved, to a very material extent, over that immediately preceding.

In the Crow's Nest Pass district, eastern British Columbia, the situation has become better during the past few months. The pick-up of output since the cessation of the strike has been remarkable. Notwithstanding the effects of the United States tariff of 53c. a ton the Crow's Nest Pass Coal Co. is reported to be doing a good trade with the Great Northern Ry., to which coal is supplied at a figure approximating $5 a ton. The coal retails in Fernie and other centers adjacent at about $8.25. The collieries are making a strong effort to extend their market throughout the prairies, particularly in Manitoba, and the prospects of success are good, providing satisfactory transportation can be obtained, as there is no doubt that the quality of the fuel from this region will make it popular with the consumer.

There has been considerable development of the coal fields of central British Columbia—the Nicola-Princeton zone. The Coalmont Coal Co. is producing at the rate of from 700 to 800 tons a day. The coal is high grade and 500 tons a day is reported to be going to the Great Northern Ry. A considerable local market is being found for the product of the Middlesboro collieries. The Kettle Valley Ry. uses some of this for fuel requirements and the coal retails in Princeton at about $7.50. Exports from this field to the coast, while growing, have not yet reached large proportions.

Miners' Union at Bottom of Nation's Coal Troubles, Non-Union Operators Tell Coal Commission

In a statement to the United States Coal Commission on Jan. 12 the non-union operators of southern West Virginia present their case. Extracts follow:

"These operators of West Virginia have no proper place before your board. Our own labor difficulties have never deprived the people of their coal; rather we have always supplied the nation when there were labor disturbances elsewhere. Our mines are not overdeveloped; instead we must constantly expand them to meet the demand for our coal. Our business is not seasonal; on the contrary we have the central west throughout the year and the Lake trade to serve in summer, the industries of the East and New England to support and a foreign commerce to sustain, all of which keeps us constantly engaged. Our prices, as a whole, have created no scandal; rather we have always joined hands with the government in every effort to control the whole market in the interest of the public. And, on only rare occasions—and then due to outside influences—have our transportation difficulties risen to the dignity of a public menace. On these accounts we do not belong in the throng which crowds your anteroom to explain their misdeeds.

"And yet, we men of West Virginia are here. You have drawn us in. The public will not be satisfied unless we appear. We have come, therefore—and gladly—to say this one thing and to prove it:

Troubles Come from Outside

"West Virginia's difficulties have all been imported. They were carried into our borders. And they originate in the fact that others having fallen into a quagmire are and have been trying to drag us in with them."

Then follows a recital of the history of the coal-mining industry of southern West Virginia, how the country was developed—towns, roads and the many things that make life comfortable were brought in by the operators and their men. The interdependence of the proprietors and their labor is pointed out, how in this primitive section of the world every facility must be provided, and how the operators and men made progress together. The picture is one of internal accord, until outside influences were brought to bear. The growth of the industry in these fields is stated and the part of southern West Virginia in producing the coal needed during the war is set forth.

How these operators met the wild demands of 1920, the deflation of 1921 and how they co-operated with the government in holding prices down in 1922 are stressed. Mr. Hoover's commendation for their part in keeping the market in bounds last summer is recited with pride. The statement continues:

"We have now shown our relations and their fruits. We have produced coal in season and out of season. We have received modest prices except when a world upheaval created conditions beyond our control. Our record is that as soon as an abnormal situation disappeared, the normal tendency asserted itself and prices declined. We now come to a new set of conditions which were imposed upon us from without—and for reasons which we will recite.

"From the beginning of the coal industry in West Virginia, it has been the policy of the operators to conduct the business on a non-union basis. This policy on the part of the operators is shared by a great number, if not all, of their employees, many of whom frankly state they will not work under the union; they will abandon mining rather than do so, and will seek other occupations. Notwithstanding the legal right of the operator and the miner to agree upon terms of employment satisfactory to themselves, we have, for a generation, been interfered with almost without cessation in every way the United Mine Workers of America could devise to accomplish the conquest of our state. . . .

"The initial conspiracy had its origin in a contract entered into at a joint conference between the miners and operators of the Central Competitive Field in Chicago, Jan. 17-28, 1898. From that contract we quote the eighth clause, which is as follows:

"'That the United Mine Workers Organization, a party to this contract, do hereby further agree to afford all possible protection to the trade and the other parties hereto against any unfair competition resulting from the failure to maintain scale rates.'

"(See Hearings before the Committee on Education and Labor, United States Senate, S-RES. 80, Page 394.)

"The true meaning of the clause just quoted, as understood by the parties thereto, appears in the minutes of the various joint conferences held after that time, from which we give only three excerpts out of many which might be given.

"At the conference held in Pittsburgh, Jan. 18, 1899, John Mitchell, National President of the United Mine Workers of America, said:

"'I want to say to the operators that an effort has been made in the past year to curtail the West Virginia coal by preventing its sale on the market.'

"(See Hearings before the Committee on Education and Labor, United States Senate, S-RES, 80, page 395.) . . ."

Another excerpt is given from the records of the joint interstate conference tending to show that the United Mine Workers were attempting to unionize West Virginia in order to eliminate competition with the organized fields on the north. It is pointed out that the national strikes of 1919 and 1922 caused cessation of some 60 per cent of the coal output. The story of high prices is hitched to these strikes, the statement continuing:

"It may fairly be said that except as to the unusual situations heretofore referred to, the high prices of coal during recent years have been the direct result of the actions of the United Mine Workers of America in calling nation-wide strikes, such strikes being made possible by its absolute control of mine labor in such a large part of the country."

The story of the efforts of the United Mine Workers to organize these fields are recited. Paint Creek in 1912, Glen White in 1917, Willis Branch and finally the armed march on Logan are cited in detail. The men who participated in these raids, their convictions in the courts and the lengths of their jail sentences are given.

Finally it is shown that the mines of the country have ample capacity to produce all the coal the country requires and it is concluded that the cause of shortages must be sought in some other direction. The statement concludes:

"Our mines, today, are running at less than 50 per cent capacity. This is due solely to a lack of transportation. We cannot supply our market if the railroads cannot carry more than half of what we can produce.

"As we have shown, every period of shortage—except that caused by the war demand—has been preceded by a strike of the union miners.

"This leads us to suggest: Stripped of all non-essentials, the two questions before you are:

"(1) How can the periodic interruptions of coal production be stopped?

"(2) How can the wild fluctuations of coal prices be brought to an end?

"Answering these questions categorically, the interruptions of production can be stopped if you can arrange to prevent, forever, the union from calling a nation-wide strike. . . .

"The price fluctuations will disappear if, and when, the great strikes cease and when the railways can carry our coal to market.

"Your commission represents the whole people of the United States. If you feel that the consumers should continue to pay present—or higher—prices for coal, the miners' union should be encouraged by new concessions. If you feel that the people are paying prices which are too high, an effective curb should be put upon its activities—by removing exceptions to the anti-conspiracy laws, and by protecting all American citizens in their right to work unmolested under such conditions as they elect."

French Coal Industry Experienced Poor Market in 1922

Had Keen Competition from British Product Till American Orders Relieved Pressure—Longer Workday Sought as Safeguard —Production Shows Marked Advance Over Preceding Year

By M. Victor Truant
Paris, France

A POOR market was the main characteristic of the French coal industry during the first six months of 1922. Under the pressure of British coals, which, owing to the low wages paid to miners in Great Britain, managed to compete with French coals into the very heart of the Nord and Pas-de-Calais coal field, the output of the French collieries was sold with the utmost difficulty and stocks accumulated at the pitheads. It is reckoned that in April or May last, in the Nord and Pas-de-Calais coal field alone, pithead stocks aggregated about 2,000,000 tons.[a]

After July the situation radically altered. Orders from North America diverted from France the pressure of British coals and at the same time a revival in French metallurgical and textile trades increased the demand for industrial coals. French domestic coals can now be obtained only with protracted delays in delivery, and industrials are in strong demand. Pithead stocks have been gradually melting away, and we are told that in the Nord and Pas-de-Calais they do not now exceed the comparatively modest figure of 300,000 to 400,000 tons.

More British Coal Coming Again

Recently British coal exports to France again have been on the increase, but the general coal demand is now much better than in the first months of the present year and besides the rise of sterling is limiting to the coasting areas the inroads of British coals. It should also be borne in mind that, owing to the wilful destruction by the Germans of all the occupied French collieries, the coal output of the Nord and Pas-de-Calais field is still 1,100,000 tons per month behind its normal level.

Official prices quoted by the collieries of the Nord and Pas-de-Calais have varied little since Jan. 1, 1922. Some time before, owing to slackness of trade and to a keener competition of British coals, they had been reduced as follows per ton: 10-15 f. for raw industrial coals; 20-31 f. for washed coals; 39-49 f. for briquets.

On April 16, 1922, some slight reductions were made: 3 f. on industrial run-of-mine; 5 f. on washed pea and on slack; 4 f. on fat coals run-of-mine; 5-6 f. on rough slack; 8-10 f. on washed smalls; 4 f. on screened semi-fat coals. Besides, a rebate for summer delivery, varying from 3 to 8 f. per ton, was granted on certain classes of sized coals.

On July 1, selling prices were again lowered as follows: Flaming coals, 1 f.-5 f. on rough slack, pea and washed coals; fat coals, 2 f.-5 f. on run-of-mine, washed pea and washed smalls; semi-fat coals, 1 f. on run-of-mine, 3-8 f. on washed pea; 3 f. on washed smalls; lean coals, 1 f.-2 f. on slack.

Since then the official schedule of prices of the Nord and Pas-de-Calais, an abstract of which we reproduce below, has not been modified (all prices are f.o.b. mine):

	Whole Range of Prices for the Four Selling Zones	Prices for the Selling Zone Exposed to the Competition of Foreign Coals
FLAMING COALS		
Slack	48– 60 f	48– 56 f
Screened	87–111 f	87–107 f
Run-of-mine	66– 75 f	66– 71 f
Peas	76– 80 f	76 f
Washed smalls	68– 72 f	68 f
Washed pea	88– 95 f	88– 91 f
FAT COALS		
Slack	54– 62 f	54– 58 f
Run-of-mine	66– 75 f	66– 71 f
Smithy pea	105–113 f	105 f
Washed pea	92–100 f	92 f
Washed smalls	74– 77 f	74 f
Washed coking smalls	72 f	72 f
Screened	89–115 f	89–113 f
Washed nuts, 30/50 mm	105–107 f	105 f
Washed nuts, 20/30 mm	102–104 f	102 f
SEMI-FAT COALS		
Slack	53– 61 f	53– 57 f
Run-of-mine	66– 75 f	66– 71 f
Washed pea	86– 95 f	86– 88 f
Washed smalls	70– 77 f	70 f
QUARTER-FAT COALS		
Slack	48– 59 f	48– 55 f
Run-of-mine	67– 73 f	65– 69 f
Washed pea	80– 92 f., 50	80– 84 f., 50
Washed smalls	62– 77 f	62– 69 f
LEAN COALS		
Slack	40– 58 f	40– 54 f
Run-of-mine	63– 71 f	63– 67 f
Washed pea	70– 90 f	70– 81 f, 50
Washed smalls	75– 74 f	57– 64 f

Reductions up to 1 f. 50c. per ton are officially granted for large tonnages.

We must mention that the mines of the Nord and Pas-de-Calais are not strictly conforming to their official schedule and while in the first months of this year they often agreed to unofficial reductions in order to obtain contracts, they are now availing themselves of the improvement of the market for quoting prices materially higher than the schedule.

In January the daily wages of the miners of the Nord and Pas-de-Calais were reduced as follows: 3 f. 25c. for adult workers (2 f. as from Jan. 16 and 1 f. 25c. as from April 16); 2 f. 25c. for underground boys (under 16 years old); 2 f. for surface boys. Allocations for high cost of living were maintained.

Before the end of the first half year, coal owners of the Nord and Pas-de-Calais, realizing that they could not meet the competition of British coals unless they substantially lowered their costs, decided, since it was not possible to inforce a further decrease of wages in the present conditions of living in the devastated areas, to ask of Parliament a modification of the Eight Hour in Mines Act, in order to increase the 6 hours 15 minutes per shift of effective work underground resulting from the application of that act. It does not seem likely, however, that this modification will be passed by Parliament, and, as the French coal market had improved meanwhile, the operators renounced their ultimatum of a wage reduction failing their obtaining, on Oct. 15 at the latest, the hoped-for extension of the day's work.

In the middle of the year some slight abatements on export rail transportation rates were granted to permit certain collieries to ship abroad a part of their stocks. Reductions on inland traffic likewise have since been granted to coal mines of the Nord and Pas-de-Calais, Lorraine and the Saar district for distances over 150 km.; but these reductions are deemed to be insufficient to enable French collieries to withstand British competition if it again becomes as aggressive as it was at the beginning of this year.

Output Ahead of 1921

During the first ten months of 1922, France produced 26,295,000 tons of coal (including anthracite and lignite), as against 20,343,000 tons during the first ten months of 1921. In 1913 the French coal output was 40,922,000 tons, or 3,410,000 tons per month, to be compared with 2,629,000 tons in 1922. It must however, be observed that the latter figures include the production from Alsace-Lorraine (367,000 tons in October, 1922), which is of course, not included in the pre-war output. Altogether, therefore, present production is about 1,100,000 tons per month behind the rate of 1913.

In 1913, mines of the Nord and Pas-de-Calais produced 27,520,000 tons of coal, a monthly average of 2,293,000 tons, while their monthly output during the first ten months of 1922 was only 1,263,000 tons. The production of the devastated mines is steadily increasing; from 587,000 tons in April last, it rose to 694,000 tons in September and to 728,000 tons in October.

Coke ovens annexed to collieries produced 807,000 tons of coke during the first ten months of 1922, as against 617,000 tons during the corresponding period of 1921. Pre-war French coke production was 2,655,000 tons (for the

[a] All tons in this review are metric tons of 2,204 lb.

whole year 1913), of which 2,445,000 tons was in the Nord and Pas-de-Calais. The difference still to be made up is therefore 140,000 tons per month. The production of coke of the Nord and Pas-de-Calais during the first ten months of 1922 was 324,000 tons. There also was coke production from ovens belonging to metallurgical works, which during the first six months of 1922 aggregated 636,000 tons.

During the first ten months of 1922 France produced 2,211,000 tons of briquets, instead of 1,962,000 tons during the same period in 1921. In 1913 the monthly production was 306,100 tons. The Nord and Pas-de-Calais alone in 1913 produced a monthly average of 150,000 tons of briquets, and for each of the first ten months of this year an average of 112,800 tons.

In spite of a lesser industrial activity, the destruction of the collieries in the Nord and Pas-de-Calais makes it a necessity that France import more coal than before the war. During the first ten months of 1922 French coal imports aggregated 18,192,000 tons, or 1,820,000 tons per month, while average monthly imports in 1913 were 1,558,000 tons. British coals imported up to Oct. 31, 1922, were 9,622,000 tons of which 999,000 tons was received in October.

France imported during the first ten months of 1921 14,583,000 tons, of which, owing to the British miners' strike, only 3,726,000 tons was from Great Britain, and 919,000 tons was from the United States.

Coke Imports Larger

French coke imports during the first ten months of 1922 were 4,162,000 tons; during the same period of 1921, 2,523,000 tons. Germany's part in these imports in 1922 was 3,522,000 tons and in 1921, 2,423,000 tons. Belgium supplied 409,000 tons in 1922 and almost none in 1921. In 1913 France imported 3,071,000 tons of coke.

France imported during the first ten months of 1922 1,125,000 tons of briquets, as against 810,000 tons during the first ten months of 1921, of which 398,000 tons were lignite briquets from Germany in 1922 and 322,000 tons in 1921, and from Belgium 607,000 tons and 284,000 tons, respectively.

EXPORTS OF FUEL FROM FRANCE
(In Metric Tons)

	Jan. to Oct. 1922	Jan. to Oct. 1921	Monthly Average in 1913
Coal	1,552,000	1,532,000	109,000
Coke	383,000	367,000	19,250
Briquets	80,000	80,000	16,000

It may seem strange that France, which has never been a coal exporting country, but which is, on the contrary, in need of large fuel supplies from abroad is now an exporter of sizeable quantities. This is due primarily to the fact that all the western part of France is more easily accessible to imported coals than to the products of the distant French coal fields, and this explains why coal mines of the Nord and Pas-de-Calais are fighting so strenuously for a reduction in transportation rates. On the other hand, the very fact that these exports are of exactly the same importance this year as last year shows that they are a consequence of long-established connections. Most of the 383,000 tons of coke exported by France from Jan. 1 to Oct. 31 was from the Loire coal field, where the metallurgical industry is not reviving to the same extent as in the East, to Switzerland and Italy.

During the first ten months of 1922 Germany delivered to the various Entente countries 15,092,000 tons of coal, coke calculated as coal, and briquets. To France alone, shipments aggregated 3,860,000 tons of coal, 3,680,000 tons, of coke equivalent to 4,906,000 tons of coal, and 392,000 tons of lignite briquets, a total of 9,158,000 tons.

Indemnity of 7,000,000 Tons

According to paragraph 2, Annex V, Part 8 of the Versailles Treaty, Germany was to deliver to France in 1922: (1) A fixed annual indemnity of 7,000,000 tons of coal; (2) The difference between the pre-war and the present output of the Nord and Pas-de-Calais coal mines, which on the basis of the monthly average output during the first ten months of this year would have been 1,030,000 tons per month. If the provisions of the Versailles Treaty has been strictly carried out, Germany ought therefore to have delivered to France 1,613,000 tons of coal per month, whereas she delivered only 915,800 tons during each of the first ten months of 1922.

It seems probable that 1923 will continue the transition to better times from the acute depression of 1921. France consumed in 1913 about 63,000,000 tons of coal, production plus imports less exports, including the equivalents in coal of coke and briquets. To this must be added the normal consumption of Alsace-Lorraine, which is about 9,000,000 tons. This indicates that the normal annual fuel requirements of France are 72,000,000 tons.

The following figures show the coal consumption of France in 1921 and in 1922 in metric tons, without, however taking any account of stocks:

	1921	1922 (Two Months Estimated
Coal	37,523,000	48,335,000
Coke (coal equivalent) *a*	4,650,000	6,113,000
Briquets (coal equivalent)	3,235,000	3,050,000
Totals	45,408,000	57,498,000

(*a*) Calculated as 4 tons of coal for 3 tons of coke and briquets as 92 per cent coal.

French mines contributed 24,847,000 tons or 55 per cent in 1921 and 31,550,000 tons (two months estimated) or 55 per cent in 1922.

Results of Reconstruction

When the reconstruction of devastated collieries in the Nord and Pas-de-Calais is completed French coal production will be 45,015,000 tons, almost exactly the French coal output in 1913, 40,922,000 tons plus the coal production of Alsace-Lorraine, 4,400,000 tons.

It does not seem probable that the devastated mines of Northern France will be able to recuperate their full capacity of production before about four years, and they also will have to overcome a serious labor shortage.

SOURCES OF FRENCH COAL IMPORTS

	First 10 Months of 1922 Metric Tons
1—Great Britain:	
Coal	9,621,000
Coke	42,000
Briquets	116,000
Total (coke and briquets converted into coal)	9,784,000
2—Germany:	
Coal	3,111,000
Coke	3,522,000
Briquets	398,000
Total (coke and briquets converted into coal)	8,175,000
3—Belgium	
Coal	2,010,000
Coke	409,000
Briquets	607,000
Total (coke and briquets converted into coal)	3,114,000
4—Saar Territory	
Coal	2,912,000
5—Netherlands (partly in transit from Germany)	
Coal	510,000
6—Various countries	
Coal	
Coke (including probably some coke in transit from Germany)	189,000
Briquets	4,100
Total (coke and briquets converted into coal)	282,800
Total	24,777,800

From the above figures it is evident that when French coal output and consumption are normal, France will still be dependent upon other countries for her coal supply to the extent of 27,000,000 tons per annum (as against about 26,000,000 tons this year and 22,000,000 tons in 1913).

If 1923 is marked by a real industrial revival and French coal requirements climb toward their normal level of 72,000,000 tons, France, with the reconstruction of her devastated collieries still far from being complete will experience serious difficulties in obtaining the coal. A general revival of trade would, of course, be felt also in Great Britain, and it is not therefore to be expected that exports could be increased beyond the present shipments to France of 11,000,000 tons. Belgium, which already is having difficulty in meeting the demands upon her production, especially for domestic coals, would certainly not be able to send more than her present 3,700,000 tons.

American Coals May Be Needed

From the Saar territory some relief might be expected, but it is unlikely that it would be sufficient and American coals alone might fill the breach. But will political and economic circumstances permit such a genuine revival to take place as soon as this year? This seems to us rather doubtful. The French metallurgical trade, though, would have a higher output but for lack of coke.

No reduction of wages is to be expected soon in French collieries and, as the men's leaders have pledged themselves to oppose any modification of the Eight Hour in Mines Act, it seems most probable that Parliament will not pass the proposed amendment. French collieries' costs therefore probably will remain at their present high level.

After Poor Start, British Coal Trade Had Good Year

Improvement Laid to Better Co-operation Between Operators and Miners and American Demand for British Coal—Management Better, Costs Lower and Output Higher—Outlook is Bright

By C. H. S. Tupholme

On the whole, the past year was a good one for the British coal industry. The year 1922 opened badly, it is true, but matters gradually improved, until December went out with production consistently above the 5,000,000-ton per week mark, prices steady, exports up and pre-war buyers returning.

This improved outlook finds its basis in two factors. The first is the better co-operation between operators and miners, arising from an appreciation of elementary economic facts, and the realization that the welfare of the men depends upon that of the industry and *vice versa*. The second factor is, or was, the demand from America for British coal.

Better co-operation has resulted in improved management, lower costs and better output. The second factor has demonstrated to potential coal buyers that Great Britain is willing to sell coal on a business basis, can supply in practically any quantity and is not anxious to benefit from the misfortunes of others. The strike in the United States exerted a strong influence in bringing back customers who had held off; here I might instance South America and Germany. Both of these countries, with others, have, since the American demand on British production, enormously increased their orders.

Production is indeed very good. In 1921 the weekly output only once reached the 5,000,000-ton level, and that was at the end of December. During the past year output has steadily mounted and, for the past few months—i.e., since the American demand—has consistently exceeded a level thought unattainable under the seven-hour day.

Rate of Output Increases

For the first half of the year the output was at the rate of some 213,000,000 tons per annum and during the last few months of the year the rate increased to approximately 272 000,000 tons. In other words, an increase in annual production rate of 60,000,000 tons is shown, or nearly 30 per cent. All the coal mining districts of Britain contributed toward this increase and it is practically impossible to pick out any one area as being exemplary.

Individual production, never very high, nevertheless improved. At the end of 1921 the pits employed 1,070,000 men; the figure is now 1,030,000. Individual output has risen to 18 cwt. per man-shift worked.

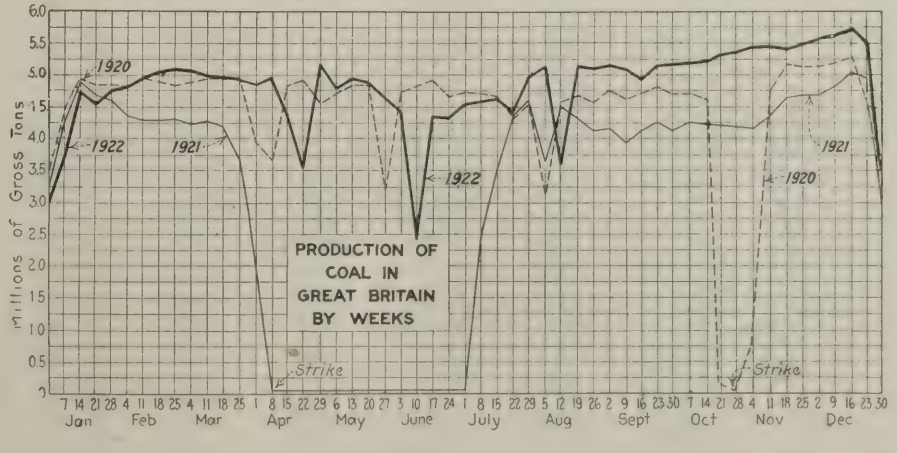
Production costs have decreased satisfactorily. When a government-controlled industry, costs per ton, other than wages, were 9s. 9d., of which 6s. 5d. represented timber and stores and 3s. 4d. other costs. Since decontrol of the industry, the cost of timber and stores per ton produced has fallen to 2s. 5d.; other costs, such as management, are now 3s. 3d.; royalties are 7d. and the contribution to the Miners' Welfare Fund per ton is 1d. Labor charges per ton are 12s. 7d. The net cost of a ton of coal at the pithead is now 18s. 11.58d.

This production cost figure nearly balances the proceeds from commercial disposals, but not quite. The proceeds per ton are now 18s. 11.41d., showing a loss per ton of 0.17d.

Though export figures for October and November are not as high as in September, they show a definite improvement over last year's figures. The United States demand, of course, was abnormal and the British operators wisely recognized it as such and did not count September's exports as an example of what was to be expected from then on. In spite of a fall during October, however, the exports for that month were 700,000 tons over the figure for October, 1921.

This increase cannot be attributed to abnormal demand from any one source. It is believed that this increase will continue and that exports of British coal to such destinations as Continental Europe, South America and India this year will reach their pre-war level.

This year will see fairly extensive development of coal-bearing areas, particularly in Wales. In the anthracite districts enterprise is encouraged by the prospect of Canada and certain areas of the United States becoming permanent customers for Welsh anthracite. The present production of anthracite in South Wales is about 4,000,000 tons annually, or about one-thirteenth of the output of the Welsh coal field, and developments in the steam-coal area are on a much larger scale.



The more important development schemes include the Taff Merthyr Colliery Co., which has acquired 1,500 acres of virgin coal in the heart of the steam-coal area. Two pits are to go down to the steam-coal measures and one to the bituminous seams, which are at a much shallower depth. Work is to be started early this year, and the colliery will be operated on the same lines as all the new pits of the Powell Duffryn Co., by electricity, which will be supplied by that company's power plant at Bargoed. These plans will also be aided by the intention of the Great Western Ry. to electrify certain of its lines in the South Wales fields.

Great hopes have been raised by the anticipation of an early report from an advisory committee appointed by the Mines Department to investigate the question of economies in the cost of production, transport and handling of coal. This committee consists of the former government Coal Controller, the president of the Mining Association of Great Britain, the secretary of the Miners' Federation and the president of the Coal Merchants' Federation. It is known that the committee has collected a mass of statistics, and the recommendation of a number of possible lines of economy on a moderate scale is expected.

Outlook Is Promising

What does 1923 hold for the British coal industry? I believe it holds much that is good and little that is bad. There is no doubt that the owners, by wisely cutting profits to obtain customers, have largely restored their prestige in the export markets, and foreign buyers now feel that they may place orders with British collieries with a large measure of confidence that their contracts will be filled on time.

Prices are not likely to fall materially. For the last few months they have been affected in only a minor

degree, which is only to be expected. On the other hand, I do not think they will rise to any extent. Britain's chief market is Europe and what she can get for her coal depends largely on how the exchanges stand. These exchanges are not likely to fall further; indeed, in many cases, they could not. I believe that the prices obtainable at present will rule within a shilling or so throughout the year.

A large measure of the coal industry's prosperity is dependent, of course, on the country's home industries. These have touched bottom during 1922 and are now definitely on the turn, as is shown by a gradual increase in home demand for coal. A better home demand will do much to stabilize prices and provide steady work for more mine workers.

American Emergency Benefited British Coal Industry

Prolonged Miners' Strike Caused Seaboard Industrial Consumers to Replenish Stocks with Welsh Fuel—Canadian Buyers Also Forced to Turn to Mother Country—3,000,000 Tons Shipped Here

GREAT BRITAIN'S coal industry benefited considerably during the latter half of 1922 from the emergency market in North America, created by the prolonged miners' strike in the United States. Not only did large industrial consumers along our seaboard take in considerable tonnage of British coals, but Canadian buyers also placed their orders to fill in the gap caused by the cessation of shipments across our northern border.

Boston and New York were the main ports of arrival in this country, although Baltimore and Philadelphia also received considerable quantities. Of lesser importance as ports of arrival were Portland and Providence.

It is estimated that 250,000 tons of Welsh coal were brought into Montreal alone last year. The majority of this tonnage was for industrial use, although Canada, feeling the shortage of anthracite more keenly than the United States, took a much larger proportion of British coal for domestic purposes in comparison with her requirements than did the United States. Despite active selling campaigns along the Atlantic Coast, Welsh semi-anthracite coal failed to find a ready market as a substitute for our domestic anthracite. Some of the advertisements were misleading as they gave the uninitiated an impression that British anthracite was being sent over in volume, while in reality, because of its prohibitive price, only a few cargoes of real English hard coal were shipped. The domestic coal really received in most cases was not well taken, as it would not stand handling as well as our own bituminous prepared sizes, which began to appear in the Eastern centers when it was apparent that anthracite would not be obtainable in the required volume. Also its distribution area was limited as railroads had published no tariffs, nor were they equipped to carry it inland.

Dry Welsh coals in low ash and volatile content were exploited as a domestic fuel and could be utilized for household consumption. Some houses handling these coals, however, were either unknown or employed sales methods which led to criticism and distrust and reduced the volume of possible trading to a considerable extent.

Varying results were reported from the use of British industrial coal in this country. Railroads and utilities in New England and New York were the heaviest buyers. The D. L. & W. Ry. purchased over 100,000 tons, 40 per cent of which was high volatile, and results were generally satisfactory. The New York Central purchased over 150,000 tons of high-volatile and experienced some trouble at first as the fire boxes were not adapted to it. Later, after the coal had been in use for some time familiarity with it obtained better results. The Seaboard By-Products Co. used a large tonnage at the time the shortage of American coal was most acute and also obtained good results. On the other hand, it is understood that some large consumers such as public-utility plants along the seaboard found that British coal was unsatisfactory and discontinued its use at the first opportunity. The Interborough Rapid Transit Co., of New York, found that it caked when performance was forced,

and though this was remedied somewhat by experiments, purchases were stopped as soon as possible. Some New England railroads which bought heavily during the emergency obtained fairly good results from gas or locomotive fuels from the Eastern ports of England and availed themselves of British offerings right up to the close of the year.

The Boston & Maine R.R. purchased about 380,000 tons of British coal and received approximately 290,000 tons during 1922, 95 per cent of which was high volatile. Only a small percentage of this was satisfactory, however, the objection on some of the coals, as North Wales unscreened, Yorkshire, Derbyshire and Lancashire being the low fusibility of the ash, which caused excessive clinkering. The large percentage of ash in the coals of higher fusibility was very unsatisfactory, even in those fuels which were bought "all-large."

During the period of real emergency the Southern coals from Hampton Roads filled in remarkably well but with the easier prices which followed the resumption of union mining, the smaller receipts of British coals were offered at prices that were difficult to meet. The Southern fuels, finding the Western market in need of tonnage, were able to obtain their own price in that territory and New England railroads were able to eke out their requirements with British coal at attractive figures.

In all, about 3,000,000 tons of British coal was sent to this country, shipments being about equally divided between the British Channel and eastern ports. The movement started late in July; during August slightly less than 1,000,000 tons were sent forward to the United States and Canada and about 1,250,000 tons during September. The October figure was not so large and shipments declined steadily until a few scattered cargoes for New England railroads now represent the only activity in the markets of the United States. The total quantity moved to this country last year approximates the volume that Great Britain imported in 1921 during her strike troubles, but for which she paid exorbitant figures when compared with the prices at which British coal entered North America.

UNLOADING FACILITIES UNEQUAL TO LOAD

The sudden strain on our port unloading facilities caused a heavy congestion of loaded boats almost at the outset. Many diversions of cargoes from one port to another were necessary, but they failed to do more than slightly lighten the demurrage costs caused by the long delay in unloading. Another bad feature was the type of vessels which brought in this emergency fuel. In many cases the hold construction was so different from our own vessels that the unloading machines were slowed down to a degree that caused heavy demurrage penalties.

The cost of the coal laid down on this side for a few of the railroads in New England ranges cheaper at this writing than on our own coals and results show that the differential can still be narrowed considerably before the competitive position of this foreign coal is menaced. Westbound cargoes of British coal can be taken as ballast for ships engaging in the South American trade and thus the cost of ocean transportation is minimized and Great Britain is enabled to partially maintain her exports of emergency fuel to this country.

A permanent market for this coal in New England is extremely unlikely, however. American coal shippers are rapidly getting into competitive position again, domestic qualities are more familiar and therefore preferred and Great Britain is out of line as soon as her normal markets recover from their long depression.

Shipments of British coal to New York, which had practically ceased in December, were resumed the last week and it was reported that contracts for large tonnages for January and February delivery had been awarded.

Germany Loses Rank as Second Largest Coal Exporter

Division of Upper Silesia Makes Nation Dependent on Imports—Production Suffered from Decreased Efficiency of Miners—Improvement Results from Overtime Shifts in Ruhr District

By H. O. Herzog
Berlin, Germany

THE year 1922 was an eventful chapter in Germany's coal situation. The division of Upper Silesia completed the great change wrought by the peace treaty, reducing Germany from her position of the second largest coal exporting country of the world to one dependent on imports. From being one of the main sources of Germany's wealth in pre-war times coal has become a source of constant worry and trouble; from a strong support of foreign trade balance into a deadweight on the country's already strained finances, which was in no slight degree responsible for the rapid fall of the mark in recent months. It is now a national problem of the first order and in its direct and indirect bearings the ruling factor of Germany's economical life. Coal prices determine the prices of all other products; their movement is the basic factor of the movement of wages. In one word, coal has become the real basis of the German currency.

Coal shortages have existed in previous years, but they were somewhat exaggerated in the interest of the constant struggle carried on for a more favorable adjustment of the coal tribute to the Entente countries. In 1922 the coal shortage became a real fact. Factors which combined to make the coal situation a precarious one was the loss of the greater part of Upper Silesia, the decline of production in the Ruhr district, the general business boom, and the railroad strike, which, although short, caused disorganization of traffic of some duration. Through the division of Upper Silesia Germany lost 75 per cent of that province's output, nearly half of its production of coke, and a large part of the country's most accessible coal reserves. Several months prior to the Upper Silesian plebiscite riots and political agitation exercised a disturbing influence upon the Upper Silesian coal production, while after the division, failure of the transportation system deprived the country for a time of the supply not only from the alienated part but also from the part remaining to Germany.

Production in all mine fields suffered under the falling efficiency of the workmen, which doubtless is due in some degree to their reduced physical ability but in the main to the latent labor conflict. This conflict is of a complicated nature. If the miners are to be believed, their attitude is caused by disappointment over the promised socialization of the mines. The true inner cause, however, is dissatisfaction with their wages. This dissatisfaction will and must exist as long as the men do not receive the full equivalent of their pre-war wages. Their leaders, however. evade the fact that against an increase of 35 per cent of the mines' complement stands a decline of 20 per cent in production. The following figures, showing the daily output computed per head of the complements in the Ruhr district and the ratio of the annual German output per head of the total number of the employed for the last three years in comparison with 1913, are illustrative in this respect:

	1913	1920	1921	(Jan.-Aug.) 1922
Daily output per head of Ruhr complement, in kg:...	883	592	561	556
Average output of total number employed in annual production, in tons:	280.7	188	181.7	179

Since September, 1922, an improvement has taken place in the Ruhr district, due solely to the overtime shifts consisting in an extension of the working time by two hours during three days of the week, or of 14½ per cent. As the result of this overtime work the rate of daily output per head increased

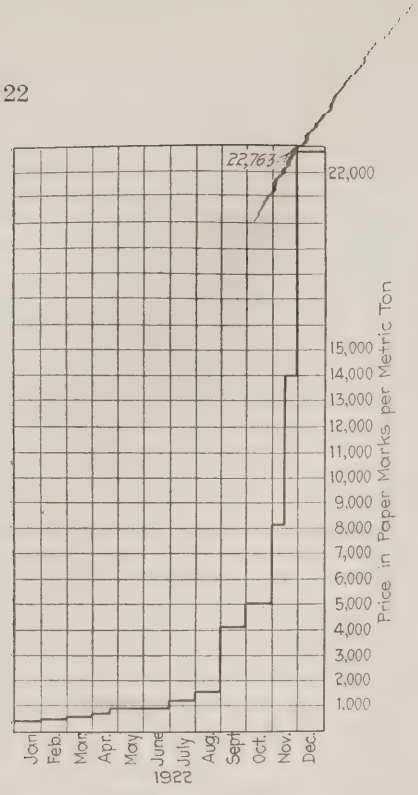

FIG. 1—TREND OF GERMAN COAL PRICES, 1922

in September to 571 kg., or 10.2 per cent, and in October to 610 kg., or 11 per cent. In November it advanced even to 620 kg. Taking into account the difference of working time, which in 1913 was nine hours per day, whereas it is now seven hours, the standard of efficiency of the miners is at present 80 per cent. If this appears satisfactory it has to be considered that the efficiency of equipment has been raised to some extent.

The monthly outputs in 1922 show considerable fluctuation. In the first three months the rate of production was improving in the following months it declined until August, when it sunk below the level of previous years. A recovery took place beginning in September, produced by the overtime shifts already mentioned. If the total falls behind the production of the preceding year by 8,000,000 tons, it is due to the territorial changes in Upper Silesia. The loss since the division of the province amounts to 14,000,000 tons.

The production of coke has advanced satisfactorily. The progress made in this respect since 1920 is over 4,000,000 tons. Of the 26,000 coking furnaces owned by Germany in 1913, 4,000 have been lost to Poland. Of those remaining only some 80 per cent were in operation at the end of 1921, which number has been steadily increased in the course of the year on the spur of pressing needs. Production of brown coal has only slightly advanced beyond the output of 1921. It seems that the rapid progress in the production of brown coal has for the time being come to a standstill.

The most marked change in the German coal situation during 1922 is the enormous rise of prices. Starting with 405 marks per ton at the beginning of the year, prices on Dec. 1 reached a level of 22,763 marks for the standard grade of Ruhr fat run of mine. The movement of prices is shown in Fig. 1.

The rise of prices was to some degree caused by the increase of the coal tax from 20 to 40 per cent, which took place in April, but in the main is due to the depreciation in exchange. The tendency was to keep prices at a level of approximately 8 gold marks without coal tax and turnover tax, but they have sunk considerably during certain periods of the year when depreciation in exchange was marked. Fig. 2, in which the stepped curve gives the ratio of coal prices to their pre-war price, and the dashed line the ratio of the exchange to pre-war parity, shows the tendency of the price movement.

Steeper still than the rise of coal prices was the increase in cost of mining material, many items of which have already reached the world market level.

With regard to miners' wages an important change took place in the course of the year 1922. In previous years they have been adjusted at considerable intervals by protracted negotiations. The rapid upward movement of the cost of living in 1922 practically installed the system of keying them to the index for the cost of living in the mining districts, adjustments being made from month to month. The average wages paid to miners at the beginning of the year was at the ratio to pre-war wages of 70 to 1; at the end of the year is was 450 to 1.

Basic factors in production costs and revenue at the end of the year, were at the following ratio to pre-war standard: Cost of material, 1,900; cost of labor, 450; price of coal (less taxes), 1,100. As can be seen, the net price paid to the mines for coal keeps somewhere midway between labor and the component parts of cost of production. In drawing conclusions with regard to the financial situation of the mines it must be considered that the level of wages paid, indicated by the ratio of 450 to 1 above pre-war level, is exclusive of the miners' other emoluments and takes no account of the fact that the ratio of expend ture in wages and salaries per ton of coal has risen by about 60 per cent on account of the lower efficiency of the miners and the increase of staff. The real margin between the price of coal and cost of labor is much narrower than appears from the above index figures; in fact it is hardly sufficient to compensate for the excess price of the other items of cost.

Another prominent feature of the German coal situation in 1922—in its financial aspect doubtless the most prominent one—is the growth of foreign imports. In pre-war times Germany imported coal, chiefly of British origin, but imports were largely exceeded by exports. In 1913, for instance exports of 34,500,000 tons stood against imports of 10,500,000 tons. But conditions now are entirely reversed. Exports from Upper Silesia to neighboring countries, carried out under Entente control, having stopped, there remain only the small quantities supplied to Holland under contract in return for a rotating credit to the German industry, and a similar arrangement with Switzerland on a smaller scale. Leaving out of consideration the coal tribute to the Entente, exports now average 120,000 tons per month, against which stand imports which in the second half of the year far exceeded 2,000 000 tons per month. The chief originating countries were Great Britain and since the division of Upper Silesia—Poland.

COAL IMPORTS BY MONTHS, 1922 AND COST IN PAPER MARKS

	Tons	Paper Marks
January	194,078	148,000,000
February	162,735	150,000,000
March	284,979	422,000,000
April	336,921	332,000,000
May	333,754	432,000,000
June	789,797	1,108,000,000
July	2,394,933	51,008,000,000
August	2,385,724	48,771,000,000
September	2,385,038	50,728,000,000
October	2,231,936	61,374,000,000
November	1,588,243	39,753,000,000
Totals	13,088,138	254,226,000,000

The coal situation at the end of the year may be summed up as follows: The present rate of production is insufficient for the needs of the country. After deducting from the output the coal tribute to the Entente, approximating 18,000,000 tons per year, a certain amount has to be imported, even under most favorable conditions for the supply of the shipping trade on the one

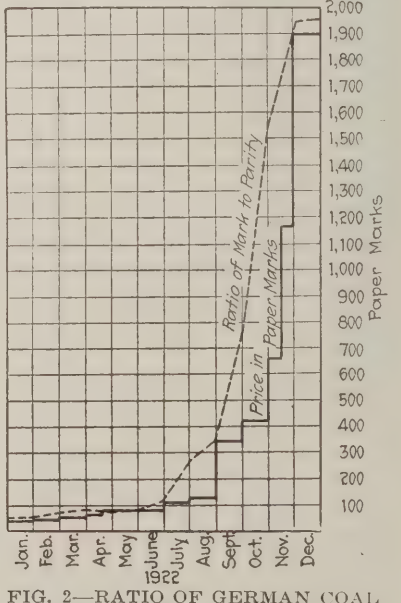

FIG. 2—RATIO OF GERMAN COAL PRICES TO PRE-WAR RATE OF EXCHANGE

Solid line shows ratio of coal prices to pre-war. Broken line shows ratio of gold mark to parity.

GERMAN COAL PRODUCTION IN 1922 COMPARED WITH PREVIOUS YEARS
(In 1,000 Tons)

	Bituminous Coal	Brown Coal	Coke	Patent Fuel—Bituminous Coal	Patent Fuel—Brown Coal
1913 (Within pre-war frontiers)	190,109	87,233	34,630	6,992	21,917
1913 (Within present frontiers)	173,096	87,233	32,653	6,811	21,977
1920	131,341	111,880	25,177	4,938	24,273
1921	176,210	123,011	27,921	5,688	28,243
1922*	128,301	124,776	29,248	5,435	27,277

*The production in November is inserted according to preliminary returns and the December production by estimates based upon intermediate reports.

hand and of the eastern part of Germany from Poland on the other. To balance the cost of these imports and to ease the market situation an increase in production of from fifteen to twenty million tons is needed. This also would help to meet further Entente demands.

Increase in production up to now has been a question of the number of miners employed. In view of the expensive housing problem and the state of the development of the mines, this number is limited, in fact, has arrived at this limit. Under present conditions, the only recourse is to the extension of the working time. An increase in the miners' efficiency is not taken into consideration for the present, as the required outlay for labor-saving equipment and the equally essential introduction of payment by results are out of the question now. Against the extension of the working time stands the miners' strong resistance. Their recent concession with regard to overtime shifts in the Ruhr district was made in a half-hearted way, only on the pressure of convincing circumstances.

With regard to the further development of mine capacity, no results on a large scale can be expected in the coming year. Of shafts now in process of sinking, five or six in the Ruhr district will be completed in the coming year, each estimated to have a capacity of about a million tons per year.

Fewer Coal-Mine Fatalities in 1922 Than in 1921, But Ratio to Output Is Higher

By W. W. Adams[1]

ACCIDENTS at coal mines in 1922 will show fewer men killed than in 1921, but the fatality rate based upon the output of coal will be higher. Reports from state inspectors covering the first eleven months, supplemented by an estimate for December, indicate that fatal accidents will number about 1,950, a reduction of 23 from the year before. Later reports may change this estimate.

The reduction in fatal accidents should have been much larger than the record will actually show, because during five months of the past year a large part of the coal-mining industry was shut down by the miners' strike, thus eliminating accidents that would have occurred had the mines been operating.

The reduction in fatalities during the five-month strike period was completely wiped out by the great loss of life in major disasters during the past year. The year's record shows 13 accidents in each of which five or more men were killed, with a total loss of 272 lives. In 1921 only five similar accidents occurred, in which 34 men were killed. To speculate is not always to waste time; had these major disasters during the past two years been prevented, the year 1922 would show 261 lives saved as compared with 1921.

Most of the larger disasters, of course, were mine explosions, and to their occurrence the increased fatality rate in 1922 is almost entirely attributable. There was a negligible increase in haulage accidents. Accidents from the use of powder and other explosives resulted in a fatality rate only two-thirds as large as the rate for 1921.

The following figures show the number of fatal accidents in each month during the past two years, the numbers in parentheses indicating the number of deaths from major disasters:

	1921	1922
January	197	158 (6)
February	160 (12)	228 (43)
March	137 (5)	196 (22)
April	164	78
May	173	84 (11)
June	170	103
July	162	84
August	155 (11)	102
September	167	163 (5)
October	180	199 (8)
November	158	349 (177)
December	150 (6)	203 Est.
Totals	1,973	1,947

[1]Statistician, U. S. Bureau of Mines.

It will be noted from the foregoing that only five months of the past year were free from major accidents, although half of the mines were on a non-producing basis from April 1 to Sept. 1. During 1921 the mines were operated eight months without the occurrence of a major disaster.

From the latest reports available it is estimated that the fatality rate from all causes for the past year will be 4.28 per million tons, as compared with 3.90 in 1921.

Falls of roof and coal always cause nearly half of all fatalities at coal mines, except in years of numerous deaths from gas and dust explosions. The actual number of deaths varies according to the quantity of coal mined, number of men employed, and period of active operation of the mines. The usual standard for comparing the increase or decrease in the frequency of accidents is the production of coal and the number of employees working any uniform period of time.

Choosing these usual standards, accidents from falls of roof and coal during the past year (excluding December) have shown a rate of 1.93 per million tons as compared with 2.01 in 1921. The lowest rate during the past eleven years was 1.72 in 1920 and the highest was 2.54 in 1911. On the basis of the number of men employed underground, the rate in 1921 was 2.58; for 1922 the rate cannot be stated, because the number of employees is not yet known. The highest rate since the bureau's organization was 2.83 in 1911; the lowest was 2.30 in 1916.

Falls of roof and coal constitute a class of accidents for which the miners themselves must shoulder most of the responsibility. The miners are constantly at the working places, they have the opportunity to continually observe the conditions of the roof, and they are best able to tell when rock or coal should be removed or additional props put up. Their safety is largely within their own keeping, and they have it within their power to eliminate perhaps half of all deaths from falls of roof and coal, and thus save more than 400 lives each year.

The responsibility for mine explosions cannot be charged entirely to the employees or to the company. Both must share the responsibility. While the immediate cause of an explosion of gas or dust may be the careless act of an employee, any failure to keep the mine in safe condition to prevent explosions must be charged against management. During the past year eleven explosions have resulted in 261 deaths, as compared with three explosions in 1921 resulting in 21 deaths. The death rate from these explosions in 1922 was 0.73 per million tons, more than three times the rate for the previous year, which was 0.23. In only two instances during the past eleven years has the 1922 rate been exceeded: in 1911 the rate was 0.74; in 1913 it was 0.90. The lowest rate was 0.19 for 1918. For each thousand employees the rate in 1921 was 0.29 (rate for 1922 not available). The rate for 1913 was the highest, 1.04 per thousand men, while the lowest rate was 0.25 for 1918.

Wetting or Dusting Needed

It has been demonstrated that explosions may to a great extent be prevented either by thoroughly wetting the coal dust or by diluting it with shale dust or limestone dust, thus rendering the mixture of rock and coal-dust non-explosive. The reduction in the number and severity of explosions in recent years has shown the effectiveness of precautions against explosions, and their recurrence in 1922 with heavy loss of life indicates the necessity of constant watchfulness against this class of mine accidents.

In recent years fatal accidents caused by underground haulage have constituted about 17 per cent of the deaths from all causes at coal mines. The fatality rate per million tons during the first eleven months of 1922 was 0.71, representing a loss of 290 lives, as against a rate of 0.67 for the full year 1921, during which 338 men were killed. A rate of 0.77 per million tons in 1911 was the highest during the past eleven years; the lowest rate was 0.62 in 1920. On the basis of the number of men working underground, the reports for 1921 show 0.86 deaths per thousand employees, as compared with 0.84 in the preceding year. The year 1918, with its record-breaking production of

MAJOR COAL-MINE DISASTERS OF 1922

Nov. 22	Dolomite No. 3	Dolomite, Ala.	Coal-dust explosion	87
Nov. 25	No. 4	Cerrillos, N. M.	Gas explosion	7

coal, had the highest rate from haulage accidents of any year since 1911; 0.99 deaths per thousand men employed. The lowest rate during the past eleven years was 0.81, in 1915. Considering haulage accidents over five-year periods beginning with the period 1911 to 1915 there has been a slight upward trend in the death rate per 1,000 employees.

Accidents from explosives normally are charged with about 6 per cent of all coal-mine fatalities. During the period January to November of the past year, 86 men were killed by explosives indicating a rate of 0.21 per million tons, as against 0.30 in 1921. The highest rate during the past eleven years was 0.37 per million tons, in 1919, due to the loss of 92 lives from a powder explosion in the Baltimore tunnel near Wilkes-Barre, Pa., on June 5. The lowest rate, 0.17 per million tons, was in 1917. For each thousand men employed the rate in 1921 was 0.39 (1922 rate not available). On this basis the year 1919 again had the highest rate, 0.48 per thousand employees, and the year 1917 the lowest, 0.22 per thousand.

The yearly increasing quantities of permissible explosives used in coal-mining operations in proportion to the output of coal is effecting a reduction in the loss of life in accidents due to explosives and in explosions of gas and dust. Figures covering the past eleven years show a downward trend in the death rate from explosives notwithstanding an occasional setback such as that indicated by the record of 1919.

Accidents due to electricity account for 2 to 4 per cent of the yearly total of coal-mine fatalities. In eleven months of 1922 the number of deaths was 69, representing a rate of 0.169 per million tons, as compared with 0.158 in 1921. The highest rate since the bureau's organization was 0.189, in 1911; the lowest was 0.115, in 1920. For each thousand men employed the rate in 1921 (latest available) was 0.203; the highest during the past eleven years being 0.211, in 1911, and the lowest 0.155, in 1917. With the increasing use of electricity in coal mines and the continual rise in the daily output of coal per man, a gradual decline in the fatality rate, however small, is an indication that mining companies are giving serious attention to the prevention of accidents from electricity.

The installation of undercutting machines in greater numbers each year and the improvement and enlargement of haulage equipment in coal mines are making possible a larger daily and yearly average production of coal per employee. The installation of any mechanical device naturally introduces new hazards into mining operations, although the net result of the installation may be a reduction in the total number of accidents from all causes combined. Such is the record regarding mining machines. The accident rate from this specific cause is higher in recent years than it was before machines came into such general use, but the accident rate in the coal-mining industry has declined and the individual employees daily production has increased. In 1922 the eleven-month fatality rate, based on 16 deaths, was 0.039 per million tons, as against 0.036 the year before. The highest rate in eleven years was 0.056, in 1920, and the lowest was 0.013, in 1912. The total number of deaths caused by mining machines usually is less than 1 per cent of the deaths from all causes. On the basis of the number of employees the rate in 1921 was 0.046 per thousand, the highest rate during the 11-year period being 0.077, in 1920, and the lowest being 0.016, in 1912.

Mine fires that have not resulted from gas or dust explosions or followed such explosions have not been the cause of many fatal accidents in coal mines, as compared with other causes of accidents. The annual loss of life in mine fires usually is much less than 1 per cent of the deaths from all causes. Yet it is imperative that this class of accidents be guarded against to prevent injury or death to employees and destruction to property either directly from the fire or through an explosion following a fire. No deaths from mine fires were reported in 1922, The highest rates were 0.151 per million tons and 0.169 per thousand employees, in 1911, while the lowest were those for 1915, which were 0.002 per million tons and per thousand employees.

Federal Coal Legislation Unlikely This Year

By Paul Wooton

WHILE the prospects are that coal will not be the subject of important legislation during 1923, the findings of the President's Coal Commission, the creation of which was the principal legislative act affecting the coal industry during 1922, may pave the way for far-reaching coal legislation in 1924.

Due to the fact that the Coal Commission's studies will last during the greater part of the year, it hardly is probable that any legislation will be considered this year, even if it be urgently recommended in the final report of the commission. Congress moves slowly in all matters. particularly in cases where the interests of large blocks of voters are concerned.

If a strike should materialize it is practically certain that an attempt will be made to meet the situation in a legislative way. The country would clamor for action before the strike would progress far. It may be assumed that the Coal Commission would give the operators and the miners time to get together, but if they should show signs of settling down in their trenches for another long drawn-out fight there is every reason to believe that the Coal Commission would come forward with a drastic recommendation which would require an act of Congress to put into effect. It is conceivable that the situation which a strike would precipitate might induce the President to call Congress in extra session for that purpose.

The year 1922 saw Washington again become, as in war days, the focal point of interest in the coal industry. Early in the year, attention centered in the capital because of the efforts being made to avert the strike. As the strike progressed the government stepped in—at first to prevent a runaway market. Then it began its control over distribution, and finally its hand was thrust in to force the termination of the strike. Out of it all grew the legislation which set up the fact-finding commission.

Important as were the precedents set in the matter of coal distribution, two events stand out with particular clearness even in a year fraught with spectacular developments in coal. Secretary of Commerce Hoover carried through a price-fixing program which probably was more effective than it would have been had he acted under an iron-clad statute. Without a semblance of law to strengthen his request, he sought and obtained the whole-hearted cooperation of the producers of 80 per cent of the country's coal tonnage in the fixing of maximum prices.

The other event was the passage of the Coal Commission Act. Since its creation the Coal Commission has been taken seriously by the industry. It is believed that as its work progresses it will come to be looked upon as of more and more importance by those who engage in businesses that touch coal. There are many who believe that from the findings of this commission will flow those revolutionary changes necessary to alter the coal industry from an overdeveloped, loosely-hung and blundering conglomeration of institutions and processes into a well coordinated, smoothly functioning activity which will make possible an accelerated industrial expansion.

Coke Industry Recovered in 1922 Despite Difficulties

Byproduct Output Was 28,319,000 Tons—8,007,000 Tons of Beehive Produced—Ovens Consumed 53,311,000 Tons of Coal—Several Plants Install New Ovens

By R. S. McBride

THE year 1922 in the coke industry can well be characterized as one of recovery despite difficuties. The industry has continued to demonstrate that it is a splendid barometer of industrial conditions—perhaps even better than the iron and steel industry, which is commonly so highly regarded as an index of industrial development.

The estimated production of coke during 1922, based upon official returns of the U. S. Geological Survey for eleven months and estimates for December, is 37,326,000 tons, of which 28 319,000 tons was byproduct coke and 8,007,000 tons was from beehive ovens.

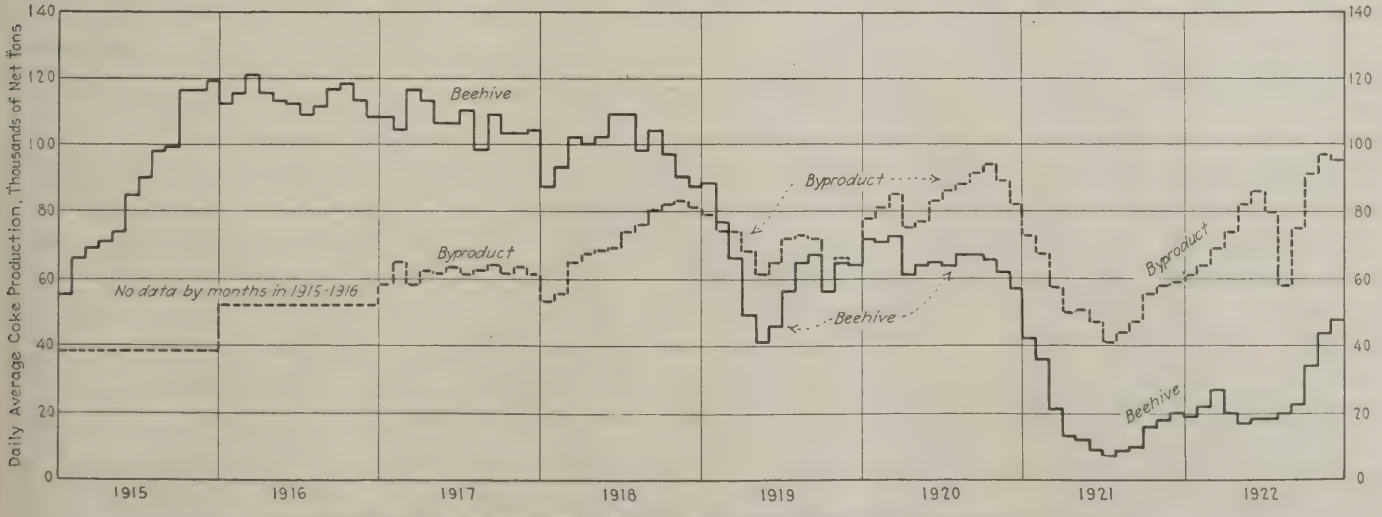
Byproduct coke has again outstripped beehive coke and more or less dominates the situation. One should not conclude from these data for the year as a whole, however, that the byproduct branch of the business is really more than three times as large under normal circumstances as the beehive branch, for during the middle of the year the beehive industry suffered more severely through strike conditions, especially in the Connellsville district. This fact is brought out quite clearly by the monthly production figures for the year, which are given in Table I.

By-product Ovens End Year Well

The byproduct coke ovens of the country were operating at approximately 50 per cent of capacity at the beginning of 1922. For the first six months of the year the activity of this branch of the business increased steadily, so that in June about 70 per cent activity was estimated by the U. S. Geological Survey. The coal shortage during July and August, however, cut down activities again, production during July being 68 per cent and during August only 49 per cent of the installed-oven capacity. With the resumption of adequate fuel supply in September a prompt renewal of activity ensued, and production during November and December was approximately 80 per cent of the entire installed-oven capacity of the country.

During the year there were regularly from 10 to 15 plants idle. Altogether 16 plants were idle for a full month or more; but during no single month were more than 14 of the total number, 71 plants, entirely shut down. Seven plants were idle the entire year. No new plants began operation during 1922 but a few ovens were added to some of those already in operation.

At the beginning of 1922 three plants had new ovens under construction. These were the Woodward Iron Co., 30 ovens; Chicago By-product Coke Co., 5 ovens, and Milwaukee Coke and Gas Co., 50 ovens. All of these were completed during the year and some of them began operation.



The coke industry normally takes about 15 per cent of the bituminous coal produced in the United States. However, in July of 1922 there were used in the coke ovens then active approximately 28 per cent of the entire coal production that month. Of course with normal coal production no such percentage of the coal would ever go into coke ovens, but the quantity so used will undoubtedly be large at all times.

In Table II are given figures for the coal consumption in both byproduct and beehive ovens and the total of the two, by months. These figures are those estimated by the U. S. Geological Survey on the assumed basis of 69.6 per cent yield of byproduct coke from coal and 63.4 per cent yield of beehive coke and coal, the average yields for the industry during the preceding calender year. The December figures are estimates.

At the beginning of 1922 there were in stock at many of the byproduct coke plants several hundred thousand tons of coke for which no market was available. Certainly at no previous time in the history of the industry was there ever on hand anything like this quantity of coke. However, as it became evident during the summer that anthracite would not be available in anything like the usual quantities, purchasers became increasingly interested in the use of coke as a substitute for anthra-

TABLE I—COKE PRODUCTION IN 1922
(In Net Tons)

	Byproduct Coke		Beehive Coke		
	Production	Daily Average	Production	Daily Average	Totals
January	1,879,000	61,000	496,000	19,000	2,375,000

May	2,537,000	82,000	432,000	17,000	2,969,000
June	2,580,000	86,000	458,000	18,000	3,038,000
July	2,486,000	80,000	450,000	18,000	2,936,000
August	1,794,000	58,000	539,000	20,000	2,333,000
September	2,244,000	75,000	606,000	23,000	2,850,000
October	2,806,000	91,000	878,000	34,000	3,684,000
November	2,908,000	97,000	1,139,000	44,000	4,047,000
December (est.)	2,945,000	95,000	1,200,000	48,000	4,145,000
Totals	28,319,000	78,000	8,007,000	26,000	36,326,000

PRODUCTION OF BEEHIVE AND BYPRODUCT COKE, BY MONTHS, 1915-1922
In the earlier years the older type of ovens produced the more coke, but in 1919 the output of byproduct ovens passed the beehive and is now well in advance

TABLE II—COAL CONSUMED IN COKE PRODUCTION, 1922
(In Net Tons)

	In Byproduct Ovens	In Beehive Ovens	Total
January	2,699,000	782,000	3,481,000
February	2,579,000	866,000	3,445,000
March	3,071,000	1,155,000	4,226,000
April	3,172,000	833,000	4,005,000
May	3,645,000	681,000	4,326,000
June	3,707,000	722,000	4,429,000
July	3,571,000	710,000	4,281,000
August	2,577,000	850,000	3,427,000
September	3,223,000	956,000	4,179,000
October	4,032,000	1,384,000	5,416,000
November	4,179,000	1,797,000	5,976,000
December (est.)	4,230,000	1,890,000	6,120,000
Total	40,685,000	12,626,000	53,311,000

cite. During midsummer the movement of this coke for gas making and for other industrial operations became active and with the early autumn it was an exception to find any unsold coke in stock.

The use of coke as a domestic fuel in place of anthracite has developed more slowly, but inability to get anthracite has compelled attention to this fuel and it is believed that thousands of households are served by coke which have never before used this fuel. This wide market, of course, promises to offer a balance-wheel for the industry which it has never before had. The exact tonnages so employed this year are not known, but it is certain that several times as much coke has been employed for domestic fuel as ever before.

Connellsville Beehive Coke Industry in Retrospect

By John L. Gans

The significant and outstanding feature of the beehive coke industry of the Connellsville region during 1922 was that it proved it had the vitality to withstand, and the recuperative power to gradually overcome, the effects of the handicaps imposed by the most skilfully planned and directed attack by organized labor, just as, during the year preceding, it had demonstrated its ability to "come back" after the most severe and most prolonged depression in the history of American industry.

These proofs of the industry's resistibility and resiliency are the more noteworthy in view of the changed relationship between the beehive and the byproduct methods of coke manufacture. Until three years ago the supremacy, in point of tonnage output, was indisputably held by the more primitive of the two methods. In 1880 the beehive oven had begun to win an important place for itself in the manufacture of pig iron, and for almost a score of years thereafter produced 100 per cent of the coke used in blast-furnace operations. It was not until 1900 that the byproduct oven became commercially successful; in that year it furnished 5.6 per cent of all the coke manufactured in the United States. Although the gain in byproduct grew steadily and increasingly from year to year, it was not until 1919 that its cruder and more wasteful competitor was surpassed for the first time. When this fact first became known in coke-trade circles prophecies were uttered which, had they been construed literally, would have meant that the beehive oven as a factor in metallurgical fuel production was doomed to early and complete eclipse.

In each of the three succeeding years the lead of the byproduct oven was increased; to 60 per cent in 1920, 78 per cent in 1921 and to a still larger proportion in 1922. To the surprise of some of the prophets and to the dismay of others, the beehive oven has persisted in its refusal to withdraw from the now seemingly unequal contest. That it still possesses certain inalienable rights as the original entrant, even if now encumbered in the race, has, by the events of the past two years, been clearly established. At least that must be one of the conclusions as to the result of the gruelling the industry has undergone during an unprecedented closing down of enterprises which are consumers of coke, followed in less than a twelve-month by the most determined effort to unionize the field.

Suffers a Permanent Loss

In all periods during which the operation of the Connellsville region has been interrupted by breaks in the continuity of industrial activity or otherwise, losses of trade have been sustained. These have been as regularly, but often very slowly, regained in large part, but a careful study of the records reveals the fact that whenever events or circumstances have lessened the opportunities of the coke producers to get their product to the consuming markets, subsequent operation has been restricted for more or less prolonged periods and, to a limited extent, permanently affected thereby.

When the sympathy strike was inaugurated in the Connellsville region on April 1, 1922, it virtually eliminated the merchant and independent furnace producers of beehive coke, and cut the United States Steel Corporation's coke subsidiary down to a 30-per cent basis during the first two months of the partial walkout. Meantime the byproduct plants with reserve stocks of coal on hand, and coal later procurable from the non-union mining districts, were able to continue making coke. The byproduct plants operated at a close approach to maximum in order to take care of customers who had previously been dependent upon the Connellsville region. It was not until early in the autumn months of 1922 that the merchant and independent furnace coke producers began their resumption movement, which gained headway from week to week until toward the end of the year both were back to better than the pre-strike basis; in fact better than at any time since the post-war depression began to issue its "run-slow" orders early in 1921.

What the immediate future, as embraced within the compass of the twelve months of 1923, may have in store is, as heretofore, largely dependent upon the iron and steel trades. If, as has been predicted by many sanguine forecasters, these trades are to prosper in an unexampled degree, the Connellsville region—still looked to as an important source of metallurgical fuel—probably will make 1920's weekly average production of 202,000 tons the minimum during the new year.

The strike of the coke workers having levied a tax, in the form of higher labor and other costs of production, which could not all be charged off when the books for 1922 were closed, no gift of prophecy is required to forecast with reasonable certainty of fulfillment that prices during 1923 will hold to a level which will be fairly representative of the enhanced value of the region's product.

That period having passed when coke operators are willing to sell their output merely in order to keep the smoke rising from their ovens, the policy of curtailing production when the price approaches uncomfortably to the limits of a remunerative profit, or unconsigned cars begin to accumulate for lack of destinations or orders, will be continued as a stabilizing measure, according to the practice of several years past.

Although the equipment of the region was reduced from 150 plants and 35,473 ovens to 143 plants and 35,042 ovens at the close of the year—a loss of 7 plants and 431 ovens—its practical productive capacity is about the same as at the beginning of 1922. The plants and ovens retired were for the most part out of operation for all of the year, hence contributed nothing to the year's gain of slightly more than 2,000,000 tons over 1921.

But all prognostications as to the prospects for larger production, maintenance of price level or other features of the trade during 1923 must be considered with due regard to eventualities and subject to contingencies which may arise.

If, for instance, the country next spring witnesses another bitter conflict over wage scales in the mining regions—toward which the present attitude and thoughts of both interested parties very plainly trend—all the skill of the union leaders and all the resources of their organization will be utilized for a desperate assault on this stronghold of the open-shop mine. In that case the coke operators will have before them the discouraging prospect of 1923 being the year in which "the worst is yet to come." And later they may have on their hands the stiffest fight of their existence.

In the happy, but admittedly uncertain, chance that the wage scales in the Central Competitive and other fields will be adjusted by application of the rule of reason, not resort to force, and without disturbing conditions in the coke region, the latter will be destined to enjoy during 1923 what, in such event, promises to be a year of more evenly distributed demand, fair prices and more stable conditions in the trade than have prevailed since the World War set business and industry topsy-turvy.

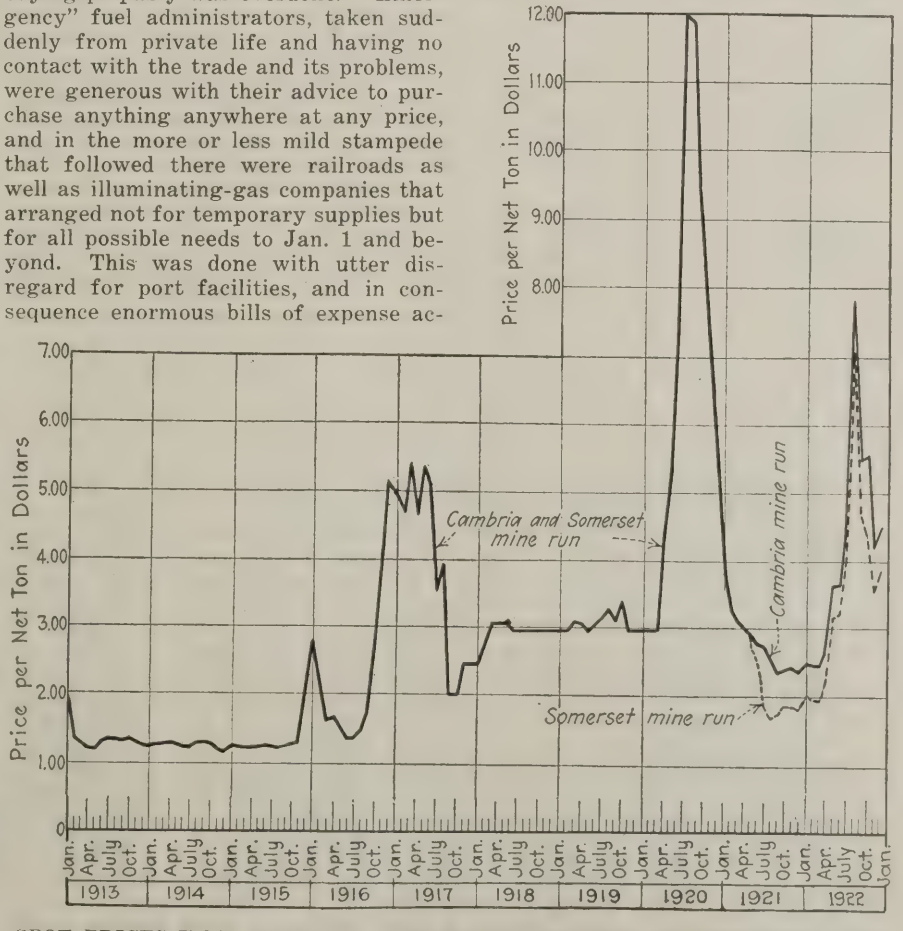
New England Bituminous Conditions in 1922

Trend Toward Water Route Further Confirmed—Receipts of British Coal a Factor in Year's Trade—Future Railroad Supply and Opening for Pennsylvania Grades Hold Interest for 1923

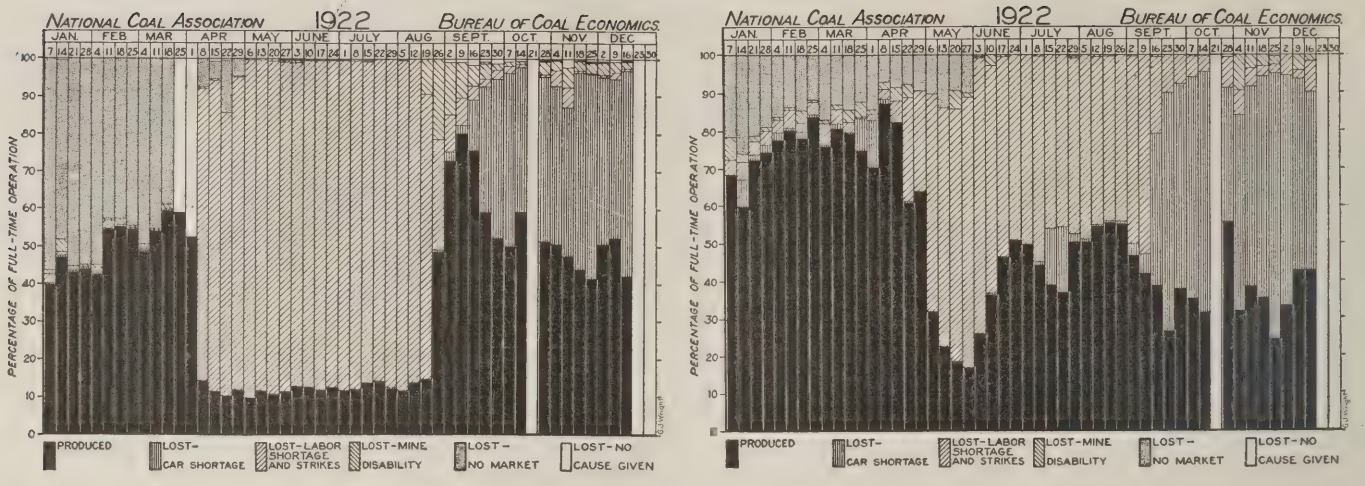
By G. G. Wolkins

A NOTABLE increase in the volume of water-borne coal was an outstanding characteristic of bituminous in New England during the year just ended. Due in large part to a continuing disparity of rates that checks the flow of coal all-rail, another very considerable factor was non-union labor in the West Virginia smokeless fields. These features together have again indicated to Pennsylvania producers the handicaps under which they operate with special reference to Eastern territory and in seasons when conditions are reasonably near normal. As at the beginning of 1922 the Pocahontas and New River interests know that if Pennsylvania mine labor adheres to a war-time scale they need have little anxiety over competition from that quarter. So long as the through tariff remains so much to the disadvantage of Pennsylvania shippers the latter must content themselves with less representation in areas easily accessible from Tidewater.



Throughout the year reserves were ample with most of the large consumers. Railroads, utilities and the industries pursued a generally conservative policy until July, when there developed within a very few days one of the worst scares New England buyers have experienced.

A protracted strike of cotton-mill operatives, effective from early in February, together with continued depression in most lines of manufacture, led steam users to agree that 80-90 per cent output in the Pocahontas field would yield enough coal easily to carry the situation. And so it turned out during the spring months, and doubtless would have continued through the summer but for the deplorable breakdown of equipment on the Norfolk & Western.



To meet pressing requirements that were at least threatening, the Pennsylvania districts had little to offer. There was an attempt, under government auspices, to put into effect some form of legalized discrimination in the distribution of cars among mines then in operation. The influence of the administration also was exerted to raise the non-union wage to the union peak scale, but while politicians were fanning the air the trade itself showed its usual resourcefulness under hard conditions. Very much as in 1903, when certain interests felt they could be the only possible avenues of supply, ships began loading at English and Welsh ports with such increasing frequency that between June and November the port of Boston alone received upward of a round million tons of British coal for steam purposes.

The scare was so great that foreign buying palpably was overdone. "Emergency" fuel administrators, taken suddenly from private life and having no contact with the trade and its problems, were generous with their advice to purchase anything anywhere at any price, and in the more or less mild stampede that followed there were railroads as well as illuminating-gas companies that arranged not for temporary supplies but for all possible needs to Jan. 1 and beyond. This was done with utter disregard for port facilities, and in consequence enormous bills of expense accrued through delays of five and six weeks in handling cargoes. It was a bubble that soon burst, and probably not for another cycle of years will certain buyers repeat their costly experience.

During most of the autumn reputable shippers, both all-rail and by water, in all districts, were obliged to mark time because this territory was almost buried under the avalanche of British coal. The let-down for a fortnight or so in July on some of the originating roads, because of the shopmen's strike, was enough to deprive mine owners of a market they had a right to count on when the strike issue was finally settled late in August. Political gestures at first had the effect of postponing buying, but as the July situation developed, so heavy a hand was laid upon available supply, chiefly in the interest of feverish railroad buyers, that New England steam users quite naturally got the im-

Central Pennsylvania Somerset County, Pa.

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

pression they would have no standing whatever until the big carriers serving New York had had their wildest claims recognized.

Fuel oil of itself has now supplanted coal to an extent that makes the market for the latter rather less responsive, in general, than it was in years when oil was not such a factor. Unofficial figures point to oil importations at the port of Boston during the twelve months ended Dec. 21, 1922, that were the equivalent of 4,250,000 net tons of bituminous coal, or an equivalent increase of more than 500,000 net tons over figures for 1921. If to this be added the rising 1,000,000 gross tons received from British ports, it will be readily understood that suspension of mining in a large number of bituminous areas does not now have the significance it once had when this territory was regularly absorbing 18,000,000 to 20,000,000 gross tons annually.

An Unsatisfactory Year

Except for special situations in July and in December, the market tone was sluggish, and for three- and four-month periods shippers were obliged to lay siege to buyers in order to move any considerable tonnage. The dullness inherited from the previous year extended well through April, and was again recurrent during September, October and November. Not in several years has there been a season when relatively so little contract tonnage from the Pennsylvania districts was placed in this territory, and until the end of the year it took unremitting toil to obtain business enough to keep this or that mine in operation. Of the Hampton Roads coals a fair volume was placed on contract, but 75 to 90 per cent of it must have been through regular channels that have subsisted each year since the war.

The year opened with large reserves and low coastwise freights. The scarcity of orders forced both steam tonnage and large sailing vessels to take charters at 85c. and less, Norfolk to Boston, and for several weeks the agencies tried to capitalize what strike talk there was by naming delivered prices for February and March, hoping thereby to induce greater output in the smokeless districts. Quotations f.o.b. vessel at the Virginia terminals ranged $4.50@$4.80 per gross ton, and for delivery inland from Boston and Providence there were competitive bids $6.15@$6.35 on cars, also per gross ton. While moderate buying developed late in February, industries were really in no better shape and were taking coal only to be on the safe side.

In spite of numbers of New River operations closed by unions the market continued extremely quiet during April. There were non-union Pennsylvania mines unaffected by the strike, and it was not until May that any tightening at the sources of supply began in the least to affect prices at re-handling points, while advances f.o.b. were very gradual. Smokeless coals had been absorbed here to the point of saturation, sales being made at $5.75 on cars Boston at a time when $5.35 was being quoted f.o.b. Norfolk.

Long-term contracts were being made at retail in Boston for $7 flat per net ton as late as May 10, and one would never have supposed a big strike in effect at both anthracite and bituminous mines. It was not until the end of May that firmer prices at Hampton Roads began to be reflected here. As it was, quotations in June rose more rapidly than in two years; distress coal was soon cleaned up, and in a single day f.o.b. prices soared from $5.90 to $6.50, on-car figures having been pushed up to $8.50 at Boston.

"Fair-price" negotiations at Washington slackened demand for a time; stocks were heavy enough to justify delayed buying, and available coal at Norfolk and Newport News grew so much in volume that the market bore every appearance of suffering more from buyers' strike than idleness at the mines. Throughout June pier accumulations ruled more than 250,000 tons, buyers were influenced by news items from Washington and by the certainty of a 10 per cent reduction in railroad coals; prices had no stability, and while $7.50 @$8 was "asked," $6 would have been accepted.

The striking shopmen, however, upset the market. The slump in service on the Southern roads rapidly made itself felt in much reduced accumulations at the piers. On July 15 only 26,000 tons of Navy standard grade was available. The great bulk of contract coal was effectually cut off, and it was known that upward of 500,000 tons of British coal had already been arranged for. Prices here rose to $13 on cars, but there was so little free coal that buyers were not much interested. Contrary to government policy in 1917 and 1918, when contractors were deprived of their purchases in order that coal might go elsewhere on a lower price basis, they now saw their coal enticed in other directions by government order on a much higher figure. Coal properly belonging to New England was sent to the Middle Atlantic states for locomotive use at extremely high prices, and it was only natural that buyers here should seek to protect themselves by covering all the foreign coal that could readily be brought over seas.

The strike over, less tonnage from Hampton Roads to the railroads serving New York, a cessation of such glaring cross-hauls as sending N. & W. cars to New England, and a $1 a ton wage increase in the non-union smokeless mines combined to ease the situation materially. Hampton Roads prices dropped to $8.25, by late September the smokeless agencies were working hard to plug holes, and there was in prospect little improvement in a very inactive market. It was not until December, when car shortages were in excess of 50 per cent that values were again enhanced and an $8 level reached on Navy standard coals at Hampton Roads.

been contending practically all the year with disaffected operatives finally resumed, and this together with a general industrial reaction brought back in a restricted sense the buying power the trade so greatly needed. The shortage of anthracite induced a continued active demand for prepared sizes, especially in the West, and at this writing the lack of motive power is serious enough to cause higher prices for weeks to come.

Railroad Fuel

In many directions the New England carriers renewed contract arrangements of other years, but suspended mining obliged them to seek relief in other quarters. Late in March the largest railroad user in this section made a considerable purchase of Kanawha at $5.39, alongside, for extended delivery, but until July the railroads, as others, bought only sparingly. They were among the first, however, to purchase British coal, and much of the high cost of receiving it here was due to their insistence upon prompt dispatch from the other side.

There is little question that certain of our own engine fuel has been permanently supplanted, at least so long as American coal can command in excess of $3 per net ton at mines and ocean freights are on anything like their present low level. There have been the usual discussions involving assigned cars for supply coal, but during November and December the railroads were in strong position to carry through their own program. Their reserves of British coal are quite sufficient to enable them to dicker with operators, and it is probable that another season will see new alignments with respect to railroad fuel in New England.

In general, much less coal has been received via the Hudson River gateways than in previous periods. There were three weeks in May when in the aggregate less than 100 cars of bituminous passed the transfer points for New England, and it will be of interest to the trade to see whether in 1923 the roads will make really serious efforts to cover as large a tonnage abroad as they saw fit to take last year.

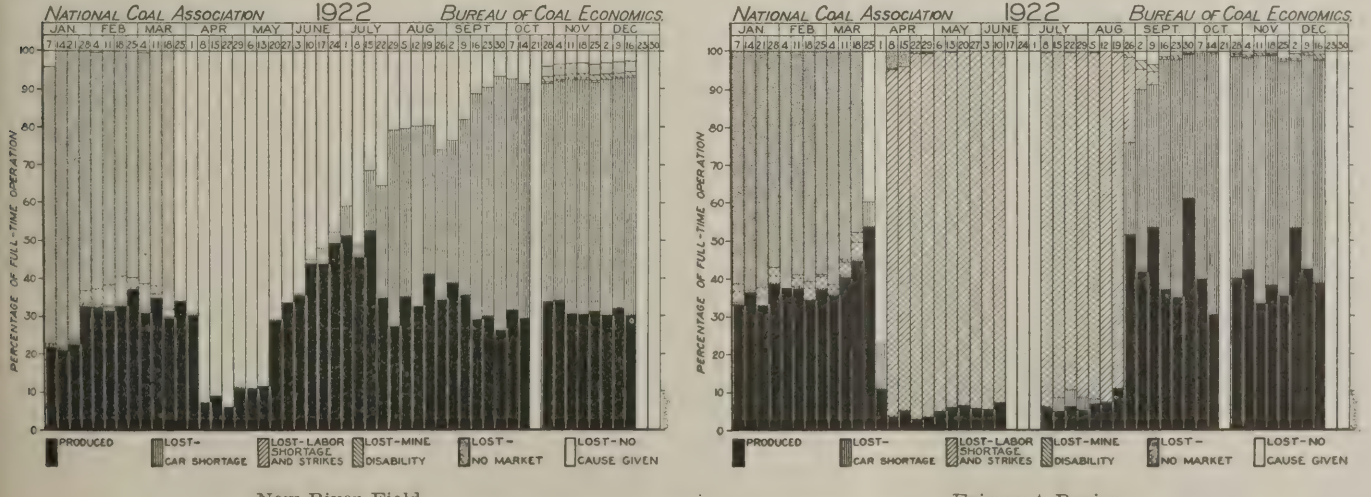
Because of conditions already indicated, the output of even choice mines in central Pennsylvania figured much less than usual in the fuel problems of New England. Only when Hampton Roads coals failed in supply was there outlet here for more than the relatively small tonnage needed in the narrow strip of consuming territory west of the Connecticut River, and indeed for much of that section there was provision during most of 1922 for ample supplies of Pocahontas and New River via rehandling wharves at New Haven and Bridgeport. It was a year that enabled New England to do very little for overburdened operators who are obliged under existing circumstances to rely mainly upon Eastern markets and the all-rail route.

Early in the year the range of Clearfield quotations was barely in excess of $1.75 per net ton at the mines, with the most favorably known Cambrias at less than $1 more. There was simply no reaction to strike prospects, and attempts were unavailing to open central Pennsylvania operations that had been shut down for several months through lack of business.

Until rail facilities were so obviously crippled that certain shippers felt obliged to turn to the water route, there was little tonnage moving to New England over the Philadelphia and New York piers. The high cost of mining put many of them out of competition with Hampton Roads shipments except in special instances, and it was late December when certain high-volatile producers began to send coal here from Philadelphia terminals.

When mining was resumed in the union districts in August, prices on the output of mines not organized dropped rapidly from the $7@$8 level. During October and November inquiry was slow. The approaching cold weather had its influence none the less on householders who ordinarily rely upon anthracite, and from that direction there was soon in evidence a broadening demand through retail dealers for the desirable low volatiles.

Late in December erratic car supply made itself increasingly felt. As usual, many operators were so eager to sell when business offered that their obligations for spot shipment were much heavier than car service would warrant, and operators are renewing their customary unfavorable reputation for filling orders.



Hardening Prices as the Year Ends

Movement all-rail and by water slowed up materially in the holiday season. Not only were delays frequent in clearing coastwise transportation, together with much adverse weather in transit, but the hiatus in mining was enough to bunch cars on all the originating roads and to create further eccentricities in delivery throughout January. The natural consequence is a general leveling up in prices. Purchases that were withheld when the swing upward first began were now heard from, and there was more anxiety over covering coal for the first months of the new year than was apparent on the surface.

On the last business day of December a sale of Pool 1 Navy Standard was rumored at $9.25 per gross ton f.o.b. vessel at Norfolk, a figure that had not been reached since panic days in August. With the reduction in tolls July 1 from $2.80 to $2.52 this would leave the return to the operator $6.73 (commission included), a reasonably remunerative figure f.o.b. mines for a Pocahontas operator!

The New Year

A forecast at this writing is unusually difficult. The railroad-rate problem still presses for solution, and the inherent absurdities of the present tariff basis were never so blatant as during the heavy movement of British coal to the Atlantic seaboard during the summer and autumn of 1922, much of it arriving when American shippers were diligently seeking business. There are signs that both mine owners and workers will avoid the wasteful expedients resorted to last season, and possibly, with promise of expanding business in other lines, the bituminous trade will take to itself new courage and begin to outgrow the unpopularity of its calling. That would be an ambitious program!

New River Field Fairmont Region

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

Year of Ups and Downs in New York Market

Acute Domestic Situation Caused Formation of Fuel Administration—Quantities Restricted and Substitutes Prescribed—Suspend Smoke Ordinance to Permit Use of Bituminous

THE past year ended with conditions quite the reverse of what they were at the beginning. With more than sufficient coal on hand in January to meet all requirements, dealers closed the year 1922 with scarcely any anthracite in their yards, unless it was buckwheat and the smaller sizes.

The five months' suspension of operations in the hard-coal fields left the metropolitan area nearly 3,000,000 tons, or about 40 per cent, short of its usual tonnage to meet ordinary demands. This shortage would have caused untold suffering had not the use of substitutes —buckwheat, bituminous or coke—been made compulsory, if any of the domestic coals were to be obtained from retail dealers.

There was not much activity in January. With more than enough coal at the terminals to meet demands operators and shippers, in order to save car charges, dumped the coal into boats. Prices quoted for independent coals were slightly below company schedules. Toward the middle of the month, however, owing to changed weather conditions, the situation improved. Stove and chestnut, as well as the steam sizes, were hard to move.

There was a temporary spurt in buying following the warning of Secretary Hoover of possible labor trouble in the mines. The public paid little attention, however, and there was little difference in the situation during the next couple of months. The steam-coal situation, however, caused considerable concern to operators and shippers. Bids asked by the city for supplying a large tonnage of buckwheat No. 1 brought responses ranging $5.53@$6.53. In anticipation of the impending trouble many washeries which had been closed down because of the lack of demand reopened and their product was stored unless it could be disposed of otherwise.

From April until the resumption of mining in September the situation was in the hands of the consumers. Operators and wholesale dealers had nothing to sell, unless it might be pea coal and the steam sizes.

Governor Miller, realizing the seriousness of conditions, named a fuel commission to make a survey of the situation, of the amount of coal on hand and report to him. As a result of this report he appointed William H. Woodin, president of the American Car & Foundry Co., as State Fuel Administrator. Deputy administrators as well as an executive force were appointed and offices were opened in this city. An examination of supplies of coal on hand within the city limits showed a total of about 47,000 tons of all sizes of anthracite. This brought a warning to coal users to burn bituminous coal, which was coming to market in fairly good volume by this time.

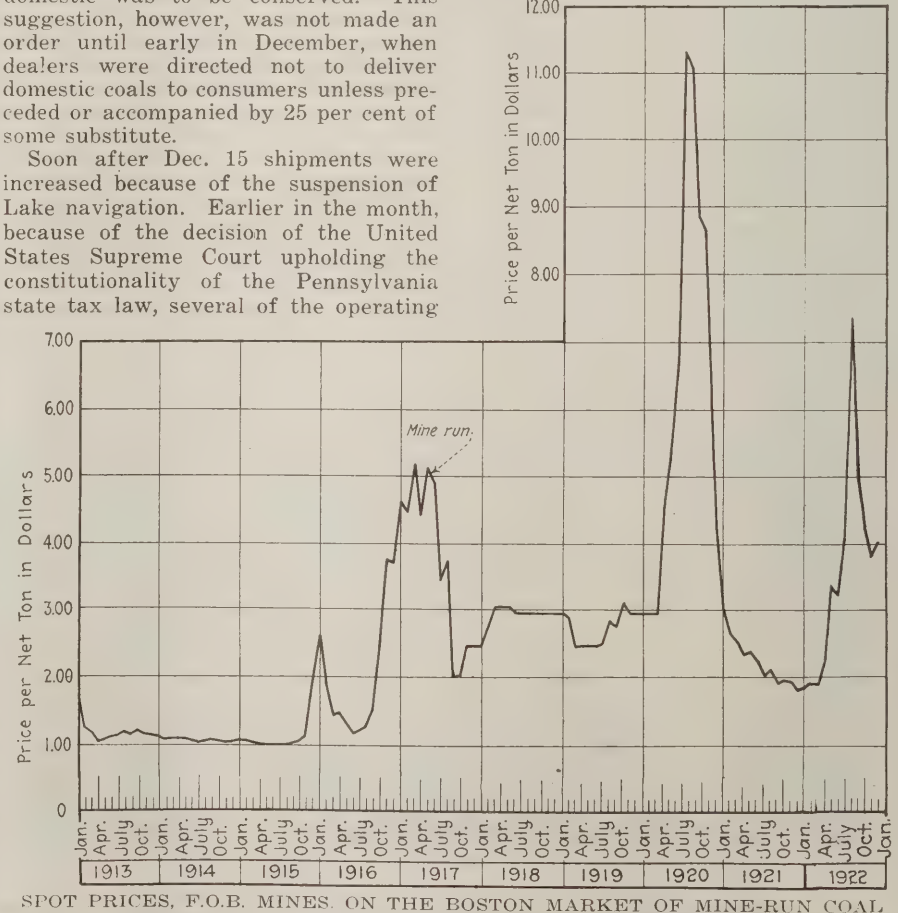
When the mines resumed operations, Sept. 11, local yards were bare of domestic coals. Thirty-six hours after operations had been started thirty cars of coal arrived at Perth Amboy, and other shipments followed in quick succession. However, with other parts of the country in no better shape than New York this district was able to obtain only its proportionate share of the output, allotted to it by the Federal Fuel Administration.

The domestic coals were quickly taken, but, because of mild weather conditions, there was no demand for the steam coals and these soon piled up at the terminals. With demand becoming slower for these coals many washeries were forced to close down and the steam-coal problem became one of considerable moment to producers.

In October the domestic situation became so serious that the Fuel Administration officials issued orders restricting consumers to not more than a thirty-day supply and at the same time fixed the price for peddler coal at 85c. per 100 lb. at the cellar or peddlers' bin.

With winter closing in the demand for coal increased and several dealers suggested the forcing of the use of substitutes if the supply of anthracite domestic was to be conserved. This suggestion, however, was not made an order until early in December, when dealers were directed not to deliver domestic coals to consumers unless preceded or accompanied by 25 per cent of some substitute.

Soon after Dec. 15 shipments were increased because of the suspension of Lake navigation. Earlier in the month, because of the decision of the United States Supreme Court upholding the constitutionality of the Pennsylvania state tax law, several of the operating companies and larger independent operators advanced their price schedules 10c.@30c. on the various sizes, but this advance was not reflected in the retail prices, which showed considerable variation because of the range of quotations of the companies and independent operators.



A comparison of retail prices in Manhattan before and after the so-called suspension in the anthracite fields is given on the next page.

There were many ups and downs in the bituminous situation during the year. Because of the strike stocks ran low and British coal was brought to these shores. Southern coals, which have nearly always been brought to this market in comparatively small quantities, were shipped here in much larger volume.

Because of the lack of anthracite in the last few months of 1922 bituminous was named by the State Fuel Admin-

*Quotations from two of the largest dealers in Manhattan. Smaller dealers may be asking higher prices, depending upon the tonnage obtained from independent operators

istrator as one of the substitutes to be used, and for the first time it began to figure as a household fuel in New York City. Bituminous screened coals of stove and chestnut sizes became so popular that they could not be furnished in sufficient quantities. Quotations ranged $6@$7 at point of loading, taking the Pittsburgh or Westmoreland freight rates.

There was a lack of supplies at this tidewater at the beginning of 1922, the average number of cars at the local terminals running close to 800 as compared with about 2,000 in normal times. However, there was little business and few inquiries regarding contracts. Harbor boatmen were on strike and there was already some talk of mine workers negotiating a new wage agreement. Quotations at this tidewater early in January ranged something like these: Pool 1, $2.75@$3.25; Pool 9, $2.15@$2.30; Pool 10, $1.80@$2.10.

The first arrival of British coal occurred during the first week in August. It was consigned to a public-utility corporation but its use was not entirely satisfactory. A survey of local stocks by the Board of Health Inspector showed about 14,339 tons of bituminous on hand within the city limits. The smoke ordinance was suspended. British coal was arriving at the rate of about 100,000 tons weekly.

A falling off in inquiries for British coal occurred early in September following the resumption of mining. Car supply was bad, but there was plenty of coal available to meet all demands. Foreign coals were being offered here at about $7.50, alongside. There was, however, no improvement in demand.

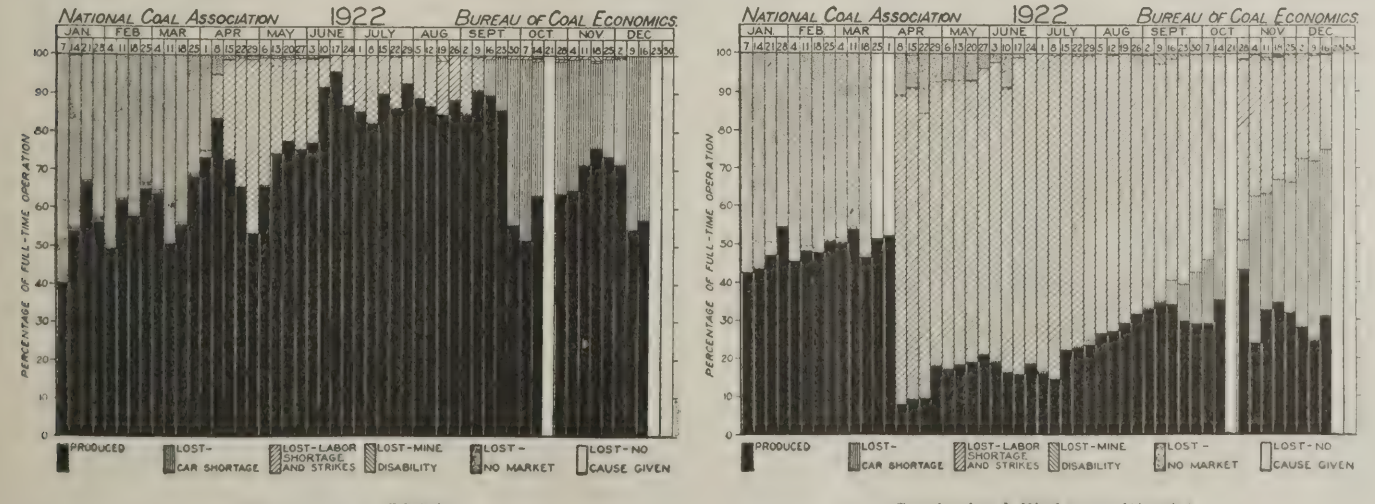
Similar conditions existed throughout October. November showed comparatively little change from the preceding month. Buyers did not appear to be greatly interested, car service continued poor and high-grade coals were quickly absorbed.

Rapid changes occurred in December. Quotations advanced rapidly and at the end of the month showed increases of from $1.50@$2 on nearly all grades. Most of this was attributed to poor car supply, resulting in greater demand. There was, however, a slight drop in quotations the first of the new year.

Screened coal grew rapidly in favor during the month and operators found themselves loaded with orders. The use of bituminous coal for heating purposes also became more general.

Baltimore Feels Few Regrets at Passing of 1922

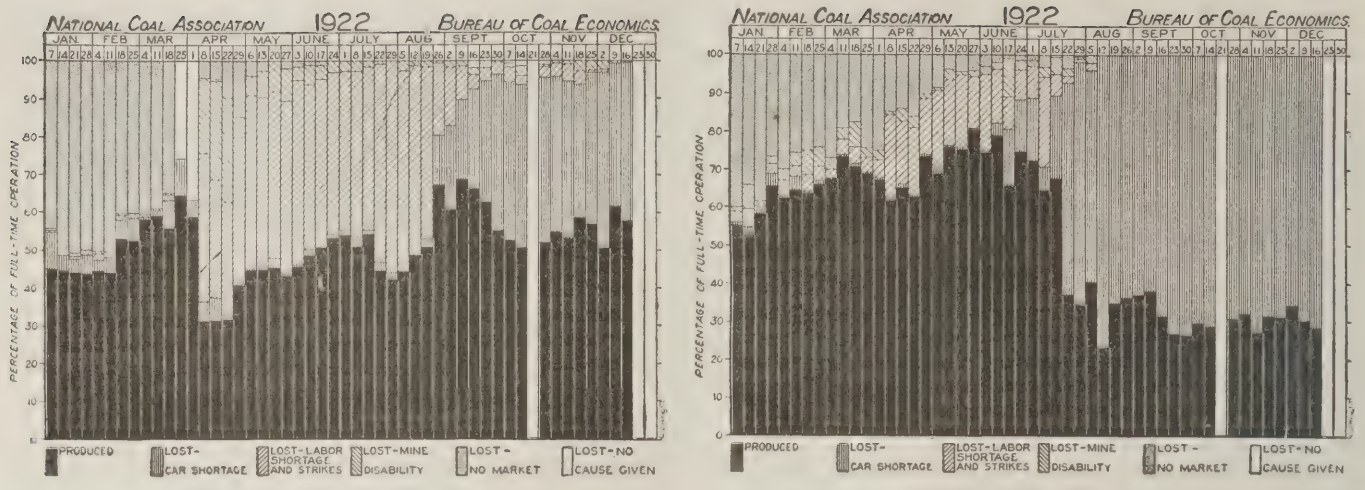
Many Cases of Actual Loss for Operators, Agents and Distributors—Strike Caused Closing of Some Yards—Water-Borne Fuel an Interesting Feature of the Industry



BY WALTER R. HOUGH

THERE will be little regret in the thoughts or feelings of coal men in the Baltimore district over the passing of the year 1922. It was a year of trials and tribulations, uncertainties and vexations and in many cases of actual loss for operators, agents and distributors.

Bituminous trading in January was of an encouraging nature with price of both line and bunker coals advancing, although the bunker trading was the better feature of the two. Best steam coals ranged $2.25@$2.40, with less desirable coals down to $2. Gas lump, Pennsylvania, was quoted at $2.40, with West Virginia selling down to $1.85. Hard-coal dealers were busy on small orders, with plenty of coal running, fair stocks in yards and little thought of the troubles to come.



In March coal men began to study the coming strike situation and urge consumers to lay in stocks in order to make conditions better latter on, but the refusal of the public to buy soft coal in quantity made the price situation weaker for all lines of bituminous, and in this the waning export movement had a considerable weight. The hard-coal men at this time faced an odd situation. An extremely mild end to the winter with strike prospects for April left the dealers between the horns of two dilemmas. On the one hand some of the dealers had stocks left over, which, acquired at high prices, threatened serious losses if the strike failed to materialize. Others, who had kept close to actual needs, did not know whether to attempt to stock for the future or stand pat.

The strike went in with such little noise that the public failed to realize its import and many coal men thought that it would soon be over. By mid-April, however, reports of the closing of several non-union mines and the lessening run of soft coal began to send prices upward. Early in May steam coals of Pools 9 and 71 were quickly absorbed at $3.50@$4. Gas coals of better grades sold up to $4 and Fairmont lump was up to $4.50. The scarcity of bunker coals was such that shipping of coal to Baltimore on barges from Hamp-

Westmoreland District Cumberland-Piedmont District

Panhandle District, W. Va. Winding Gulf, W. Va.

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

ton Roads began, and this was taken over at $5.50@$6 gross, alongside.

In June results were shown from the Hoover conference, and a number of shippers who had been expected to sell around $4@$5 let go of their holdings suddenly and prices even for better grades of steam coal dropped to around $3. This did not last, however, for before the end of the month practically all of the regions, with the exception of the Southern fields, were selling from good to best coals at $3.50@$4, while Hampton Roads was disposing of New River and Pocahontas coals at $3.25@$3.50, thus holding within the Hoover range. A number of yards were closed during the month because of a lack of anthracite supplies. Not more than ten or twelve in Baltimore had any substantial reserve.

August brought a state coal distribution commission and a questionnaire on supplies in industrial bins, a sharp advance in prices of soft coal and a tremendous drop in the amount of deliveries. Anthracite dealers took up the question of substitutes, and urged customers to lay in stocks of bituminous. Small lots of bunker coals continued to come from Hampton Roads and some English importations began.

The end of the bituminous strike sent an increased tonnage into the market. Prices did not slump at once, good grade steam coal holding firm at $6@$6.50 and less desirable fuels around $5. By the end of September, however, quotations for best steam grades were $5.25@$5.75; for intermediate coals, $4.75@$5, and poorer grades around $4.25.

SPOT PRICES, F.O.B. MINES, OF BITUMINOUS COAL FROM POCAHONTAS REGION, BY MONTHS, 1922

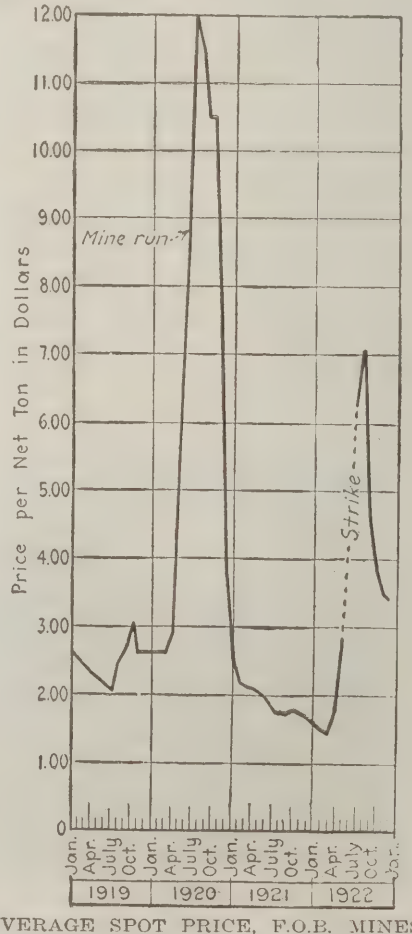
AVERAGE OF QUOTATIONS ON BOSTON, CHICAGO, CINCINNATI AND COLUMBUS MARKETS

	Mine-Run
January	$1.71
February	1.66
March	1.60
April	1.67
May	3.02
June	3.05
July	3.98
August	5.96
September	5.21
October	5.13
November	4.44
December	4.82

During the early days of the month a number of hard-coal dealers took considerable quantities of Welsh coals, which they sold at $13.50@$14.50 delivered to homes. The first receipts of anthracite came to hand from independent sources and while there was no set price arrangement through the Baltimore Exchange, No. 1 was generally sold around $15.75; Nos. 2, 3 and 4 at $16; Sunbury, $16.50, and Lykens Valley, $17.

Heavy arrivals of British coals during September and early October had their effect on the October market. Hard-coal dealers began to receive a more liberal run of anthracite, and there was general hope that November and December would bring liberal runs; a hope which was badly blasted later. Early November found a peculiar situation in the soft-coal trading here, there being a steady decline in price in view of the light call from large industries.

The last month of the year brought new strength to the soft-coal trading at Baltimore. Many large industries got actively into the buying and prices went up sharply. Hard-coal dealers were complaining bitterly that December had fallen back even of the light shipments of November. Really cold weather and snow had increased the urgent demand and householders began active buying of substitutes.



The subject of water-borne coal at Baltimore is interesting, especially when comparisons are made with former years. Possibly the most striking development was that the importation of coal from the British mines during three months of the year surpassed by 13,711 tons the total amount of the export cargoes tabulated to Dec. 18.

With Europe oversold on American coal, at least, 1922 opened with an extremely small demand for the fuel from this side. Just as the trade was beginning to show a tendency to return to normal, and March of 1922 had registered an increase in the business which made it the largest month since October, 1921, the miners of this country called a strike and exporting was discontinued after April 10.

While the period of the importation of British coal to Baltimore was of but short duration, dating from Aug. 25 to Oct. 28, it was extremely lively, particularly that portion of the trade covering the month of September.

The number of ships engaged in the trade and the amount brought here each month was: August, 1 ship, 6,694 tons; Setember, 14 ships, 79,895 tons; October, 4 ships, 26,595 tons.

With the beginning of the strike the New England coal trade from Baltimore began gradually to reduce until it was discontinued after a few weeks. It has been renewed, however, and a considerable volume of business is now being done in this line.

AVERAGE SPOT PRICE, F.O.B. MINES ON PHILADELPHIA, NEW YORK AND BALTIMORE MARKETS OF MINE-RUN COAL FROM FAIRMONT DISTRICT

Most Unsatisfactory Year in Philadelphia

Few Found Cause for Enthusiasm—After Watchfully Waiting for Lower Prices Consumer Paid More — Rate Cut Had Little Effect—Anthracite Tax Important Enactment

By W. D. Hammer

FROM beginning to end 1922 was a most unsatisfactory year to everyone in the trade. The operators, with over five months' idleness to contend with, had little chance to show a profit on their undertaking, including both bituminous and anthracite. In anthracite the retailer, being unable to do business for the lack of stock during most of the summer months, also put in an unprofitable twelve-month, and the consumer, always eager and watchful for lower prices, in the long run actually had to pay more than ever for fuel.

In the anthracite trade the year opened with plenty of all sizes of coal in the dealers' yards, and a winter which was close to mild at all times retarded buying, as even in the very beginning consumers were afraid to buy in volume lest they have something left over on April 1, when they felt certain there would be a general reduction in miners' wages, with a consequent decrease in retail prices.

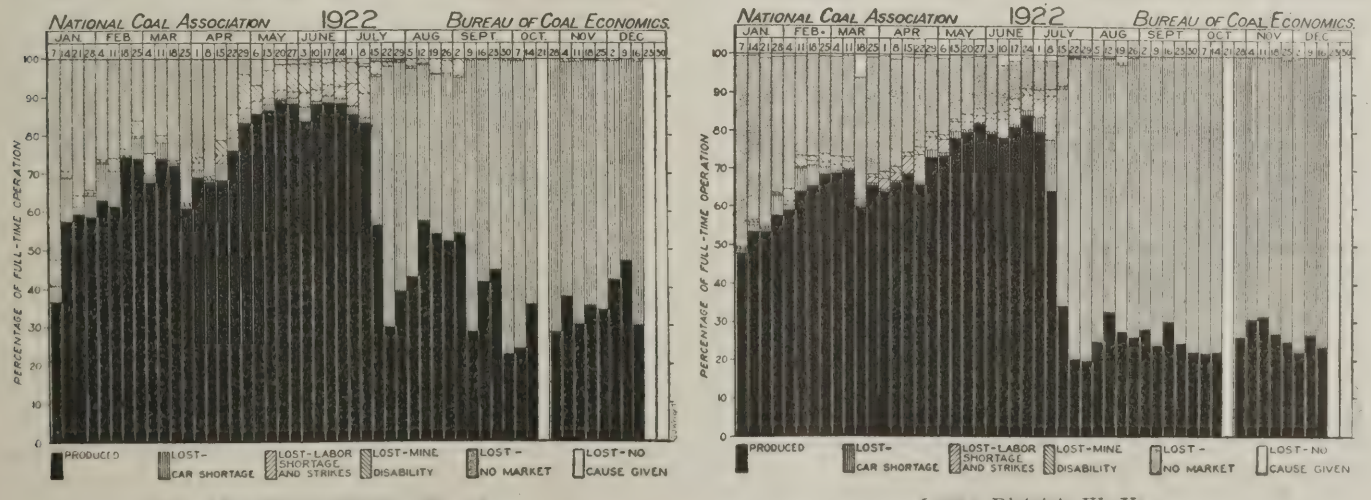
It is worth while recording the mine prices at the beginning of the year, which were as follows:

Company—Egg, $7.75; stove and nut, $8@$8.10; and pea, $6@$6.25. Independent—Egg, $7.75; stove and nut, $8.10@$8.25; pea, $5@$5.50.

With very little coal coming in from April 1 onward, except from storage yards, the retail yards began gradually to show shrinkages in their stock, and when Aug. 1 was reached very little coal of any size was left but pea coal. It should be remembered that the companies had heavy stocks of pea on hand, but this did not begin to move until July 1, and they were anxious for business from anyone on this size.

During August Governor Sproul appointed a fuel commission to supervise the distribution and prices of coal, as with no production during the entire spring and summer it was easy to foresee difficulties when production did begin.

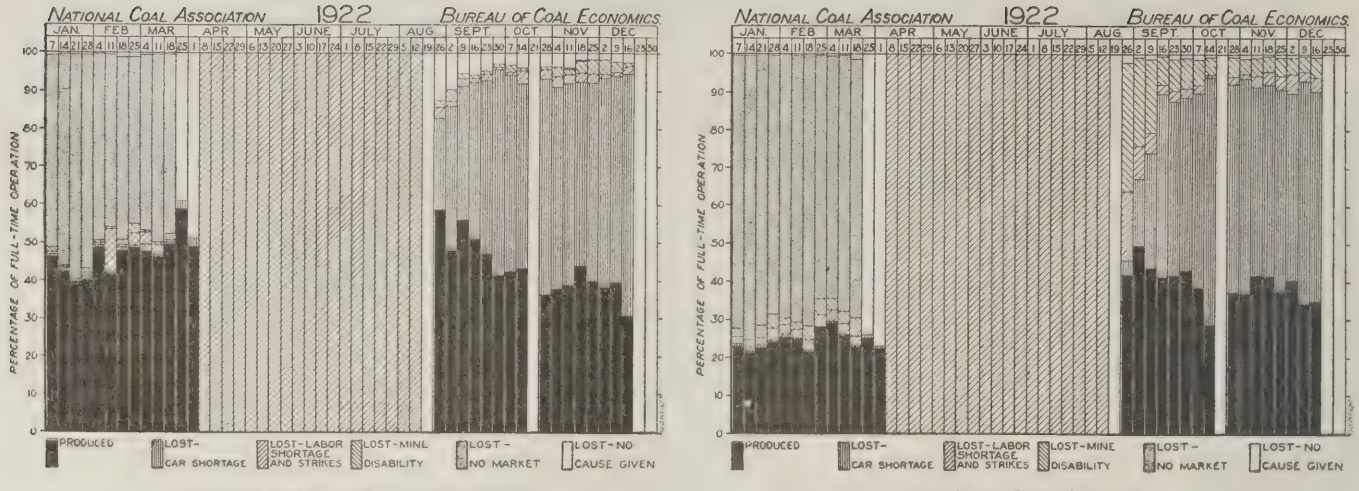
Coal began to arrive in the city soon after the resumption of work, although there was no particularly strong demand for it from consumers. For a while prices were an uncertain quantity, as the companies had not decided on their schedule and shipped upon the stipulation that price would be arranged later. Quite a number of the independents started with a price of $9.50 for egg, stove and nut and $7 for pea, shading down to one independent with a low price of $8.50 for the large sizes and $7 for pea. Later this was followed by company prices ranging $8.10@$8.35 for egg, stove and nut, and $6.15@$6.20 for pea. In October the fair-practice committee of the State Fuel Administration adjusted independent prices to $9.25 for the large sizes, and a few independents kept on with $9.50, and all with pea at the old figure of $7.



Within less than a month a number of independents claiming to be unable to do a profitable business at the above prices, began to make advances, and upon request of the fair practice committee were invited to present their cost sheets to them. As a result of this investigation advances in some instances of $1 a ton were allowed bringing certain independent prices to $10.50@$11 for the large sizes and $8 for pea. The lowest independent prices for the balance of the year were $9.25 for family coal and $7 for pea.

The steam-coal market started off strongly in the winter of 1921-22 and and was going well in January, with the companies selling practically all of their production at $3.50 for buckwheat, $2.50 for rice and $1.50 for barley, with the independents at times able to get a premium on these figures. However, it was another story later on. In February the independents were glad to get $3 for buckwheat, $2.25 for rice and $1.25 for barley, with the companies maintaining their schedule, but dumping much coal in the storage yards. With the approach of the strike, steam coals stiffened and independents obtained $3.50 for buckwheat. As the company storage piles began to melt away river barley came on the market in June at $1.60@$2.25, and fairly well maintained these prices until fresh-mined coal arrived again in September, when it faded out of sight. The new company prices on steam coals were: Buckwheat, $4; rice, $2.75; barley, $2, while the independents tried to get $1 above these prices, which they did for a short time, but prices weakened in October and much independent coal sold at 25c.@75c. less than company prices.

The state tax act was always a subject of great interest and even after its validity during the summer was affirmed by the state courts the dealers thought it would be finally quashed. Nevertheless in November the U. S. Supreme Court upheld the act, and while it was thought that the tax might be added to the coal price, no company made a specific charge for it.



As the year came to a close the retail dealers in this vicinity found the greatest difficulty in getting enough coal to supply the needs of their customers, and they were compelled to resort to various substitute fuels to keep the people warm. Dealers generally stocked up with bituminous coal, coke and anthracite buckwheat, but it was only with the greatest difficulty that the people would take them, and only then under stress of much colder weather later in December.

In the bituminous trade the entire year seemed to have been spent by the consumer in jockeying for lower prices, despite many and serious issues such as rail and miners' strikes crowding to the front, which ordinarily would have spurred the consumer to take steps to accumulate reserves of coal. Despite low prices at the beginning of the year, such as $2.70@$3.10 for Pool 1; $2.30@$2.80 for Pool 9; $2@$2.25 for Pool 10, and $1.65@$1.80 for Pool 11, the consumer as a general thing simply re-

fused to buy for more than current needs.

One of the reasons for not buying was the expectation of a freight reduction, which was a live topic of conversation right up to the time the actual reduction was granted, to become effective on July 1. After the reduction was considered from all angles, however, it amounted to so little that it had no effect on the trade.

The first indication of better business in the coal business came in May, when the iron industry of the country began to take on a renewed lease of life and began to make better demands for fuel. For a time it seemed as if the steel people were bidding for every pound of coal produced and prices went mounting to $5@$5.75, irrespective of classification. It was at this time that Secretary Hoover stepped in and endeavored to prevent unseemly prices.

A plan of fixed prices for various districts was agreed upon, with $3.50 a popular figure, although the Pennsylvania low-volatile steam producers never actually came to an agreement, these interests endeavoring to get something around $4 for their output. The negotiations had the effect of holding prices in check, however, and in June there was little coal at $5, the price that had prevailed hitherto.

In July the going out of the railroad shop workers had a serious effect on the trade, as much of the non-union coal originated on lines in the South which were most troubled by the strike. As a result prices bounded forward to as much as $8.50. It was then that foreign shippers saw an opportunity to come into this market and prices of $8.50 @$10, laid down at piers in this city, were paid for foreign coal, which continued to be sold freely in this market right through August.

Following the Cleveland agreement prices naturally shaded downward, running from $5.50@$7.25, and at the same time sounding the knell of foreign coal buying. In November the downward movement continued. All of this softening was in the face of a poor car supply, as the roads had far from recovered from the effects of the strike.

The climax of the downward movement seems to have been reached the latter part of December, due to a combination of circumstances. First of all the car supply, instead of growing better, became worse, and in addition colder weather also induced greater consumption. The roads had an opportunity earlier in the season to stock up on fuel, but declined to take advantage of the situation until actually compelled to. With the lessening car supply prices began to move up gradually from December onward and by midmonth were running as follows: Pool 1, $5.20@$5.60; Pool 9-71, $5@$5.30; Pool 10, $4.30@$4.50; Pool 11, $3.40@$4.

Buffalo Has Influx of New Sales Agencies

Newcomers Appear Unobtrusively—No Notable Retirements and No Deaths During Year—City Is Getting Scarcely More Than Half of Tonnage of Year Ago

By John W. Chamberlin

PROBABLY the most noticeable new feature of the wholesale coal trade of Buffalo during 1922 is that mostly during the latter part of the year the number of sales offices have increased about 20 per cent over the previous year and have done so with an unusual degree of quietness and lack of display.

Scarcely a member of the older trade of the city has retired from it in any way during the year. If an outside concern withdrew its agency the manager commonly remained on his own account, sometimes doing much better than he had formerly done. No member of the city coal trade has died, and so far as the anthracite trade is concerned practically no changes whatever have taken place. Members of that trade are still wondering why, with mining considerably heavier than it was a year ago, the city is getting little more than half the coal it did then.

Buffalo is naturally a bear market. With only about a dozen mining companies of its own and being able to play the Pittsburgh, Ohio No. 8 and the Allegheny Valley bituminous markets against one another it often forces even Pittsburgh to sell coal to this market for less than its home quotations. Quite often, so far as steam coal is concerned, the Pittsburgh quotations are not paid here. Gas coal, being more restricted as to territory, is now holding above its usual average as compared with steam grades. All steam coal weakened as the year closed, but independent anthracite, with Scranton and Wilkes-Barre as headquarters, was strong and occasionally advanced from the former premium of $4@$5 over the schedule prices. If the heavy companies had gone into the market as the independents did a trade the like of which has not been seen yet would have resulted.

As, ordinarily speaking, little that is strictly personal is found in the coal trade of the year, mention may be made of the newcomers into the Buffalo market. They include the following, with manager's name if the company name does not indicate: Charles E. Graves Coal & Coke Co.; Grant B. McLaughlin & Co.; W. P. Smith Coal Sales Co.; Astel Coal Co., D. E. Ruckman; J. P. Burton Coal Co., A. R. Stubbs; Cheswick Coal Co., A. R. Carlson; Link-On Coal Co., William E. Schmidt; Theodore Krug Co., F. C. Eschelman; Maher Collieries Corporation, O. E. Southard; Manufacturers' Fuel Co., E. J. Delaney; Merrimac Anthracite Coal Corporation, Treasurer W. G. Russell; Penn-Empire Fuel Co., A. E. Yallowich; Valley Camp Coal Co., M. F. Murphy; Valley Coal Corp., A. D. Grasso.

The Lake trade closed on Dec. 15 with the loading of the steamer *A. B. Uhrig* for Milwaukee. A big effort was made to continue the movement later and 123,600 tons was loaded in December, which is the largest amount for a long time. The amount loaded during the season was 1,070,680 tons. The shipments for the season of 1921 were 3,810,315 tons.

Pittsburgh Coal Prices Pursue Devious Path

During the Strike Regular Pittsburgh District Coal Practically Disappeared from the Market—West Virginia and Kentucky Coal Passed Through Pittsburgh Market to Clairton

By B. E. V. Luty

THE YEAR 1922 opened with the Pittsburgh coal district at the same disadvantage, as compared with adjacent non-union districts, as had obtained during the major part of the preceding year, the non-union mines, with deflated wage scales, being able to undersell the Pittsburgh district operators. All that the district had for competitive purposes was its high-grade gas coal, but this did not mean much in point of tonnage because even in the case of gas coal some users were unwilling to pay the extra price. A little help was afforded by the fact that for delivery at many points the non-union fields were at a freight disadvantage. Coal freights were reduced July 1, 1922. Prior to that time, to illustrate, the Pittsburgh district had 14c. lower freight to Buffalo than the Connellsville region.

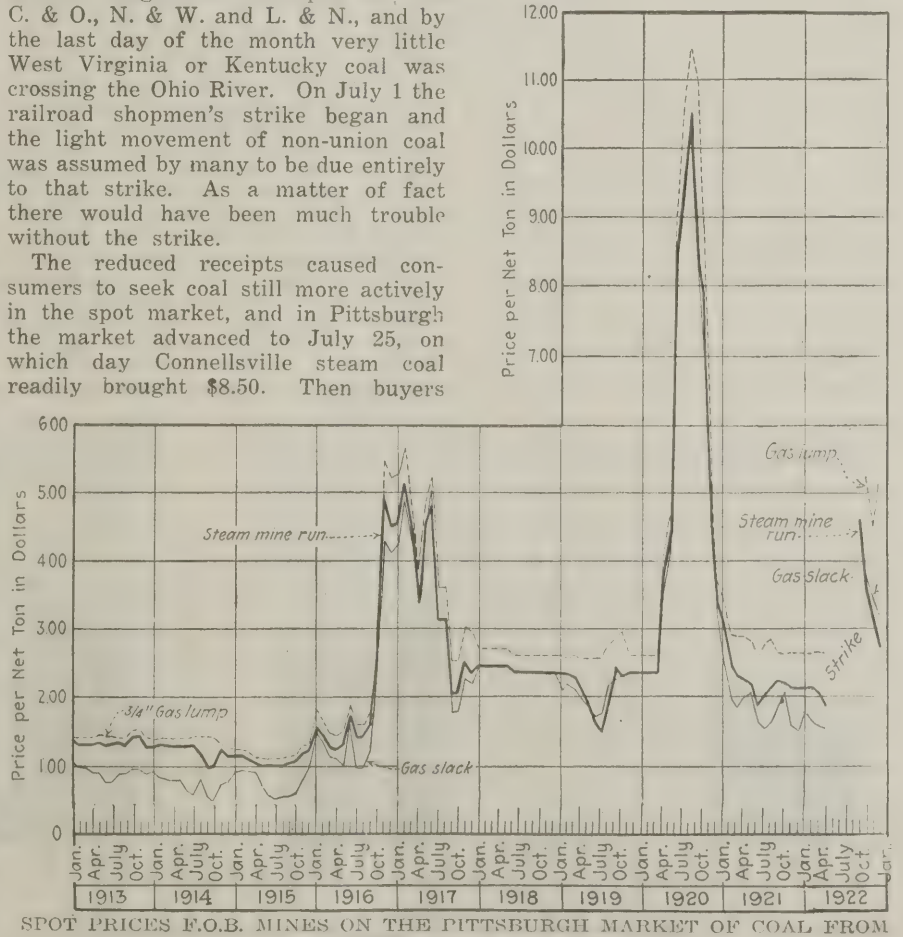
The year opened with Pittsburgh steam coal at $2.10 @ $2.20, some ordinary gas coal being available at about this range, while high-grade gas was held at higher figures. Pan Handle 1¼-in. domestic lump was $2.75 @ $2.90. There was no market for nut coal and slack was rarely bringing as much as $1.50, so that sellers of screened coal were averaging only about $2.35 for the run of the mine, little more than was obtainable for ordinary steam mine run.

During the first two months of the year the market held at substantially these figures. Consumers were stocking coal against the strike, which was universally expected. They could not remain in ignorance, for much advice was being given to stock coal and to avoid any "last minute rush." The advice must have been fully heeded, for without the strike prospect decreasing a particle a slump came in the market about March 1. Pittsburgh coal, having already been quiet and at prices the operators asserted did not cover the full cost of production, could not suffer much from this slump, which was seen better in Connellsville coal, which had been moving freely for stocking purposes and which declined, using round figures, from $1.75 to $1.50 for Pittsburgh seam and from $1.50 @ $1.60 to $1.25 @ $1.35 for Sewickley vein. Such market as there was for Pittsburgh coal at the end of March could be quoted at $1.80 @ $1.90 for steam mine run, and $2.60 @ $2.70 for high-grade ¾-in. gas. There was nothing like a fair-sized turnover.

When the strike came regular Pittsburgh district coal disappeared completely from the market, except for the relatively small output of a couple of stripping operations on the Pan Handle, this coal being offered at $2.75 for steam lump. Strikes promptly developed in the Connellsville region, from which consumers had been expecting to draw coal right along during the strike.

Except for strip-mined coal, trading in the Pittsburgh market throughout the strike was entirely in the product of near-by non-union fields, whose output was limited by what the trade considered "non-union" strikes but which had been produced by emissaries of the United Mine Workers, who enrolled the miners as regular members on payment of a nominal initiation fee of $1 or $2.

Throughout the second quarter of the year the market rose more or less continuously, until by June 30 Connellsville steam coal was bringing $3.75 and Westmoreland gas somewhat more. The extent of the rise was due largely to the bidding of steel companies which had not expected serious strikes in the Connellsville region. They bought West Virginia and Kentucky coal, and as such fuel commanded high freight rates the consumers were willing to pay high prices for Connellsville coal, which was nearer at hand. Both West Virginia and Kentucky coal came into Pittsburgh, and some went through Pittsburgh and up the Monongahela River as far as Clairton.



In the closing fortnight of June serious congestion developed on the C. & O., N. & W. and L. & N., and by the last day of the month very little West Virginia or Kentucky coal was crossing the Ohio River. On July 1 the railroad shopmen's strike began and the light movement of non-union coal was assumed by many to be due entirely to that strike. As a matter of fact there would have been much trouble without the strike.

The reduced receipts caused consumers to seek coal still more actively in the spot market, and in Pittsburgh the market advanced to July 25, on which day Connellsville steam coal readily brought $8.50. Then buyers became imbued with the notion that prices would be fixed by the government, and practically withdrew from the market, following which on the morning of Aug. 1 the price was quotable at $6. There was a minor rise afterward, and when the union mines opened the market was $5.

SPOT PRICES, F.O.B. MINES, OF BITUMINOUS COAL FROM PITTSBURGH DISTRICT, BY MONTHS, 1922
QUOTED ON PITTSBURGH, PA., MARKET

	Lump	Mine-Run	Screenings
January	$2.65	$2.15	$1.78
February	2.65	2.15	1.65
March	2.67	2.04	1.57
April	2.65	1.85	1.55
May			
June			
July			
August			
September		4.60	
October	5.22	3.59	3.81
November	4.50	3.16	3.47
December	5.15	2.72	3.19

The first Pittsburgh coal that appeared on the market after the settlement was Youghiogheny gas, which brought $6.50 on the first sales. There were constant declines, almost from day to day, afterward. The market was not closely quotable for a time on account of the wide range in quality, as various coals not ordinarily mined were being produced on account of the emergency. Just before the close of the Lake season Pittsburgh steam was $3.25 @$3.50, with Youghiogheny gas at $4.50 for mine run. At the close of the Lake season the market took another drop, and then ruled to the end of the year at about $2.50@$2.75 for steam and $3@$3.25 for Youghiogheny gas, mine run.

Connellsville Market Rebounds from Low Ebb

Demand Resulting from Strike Proves Stimulus—Steady Falling Off Follows Settlement—Operators Doggedly Resist Further Drop—Finding Destination Now a Burning Question

By L. U. Leslie

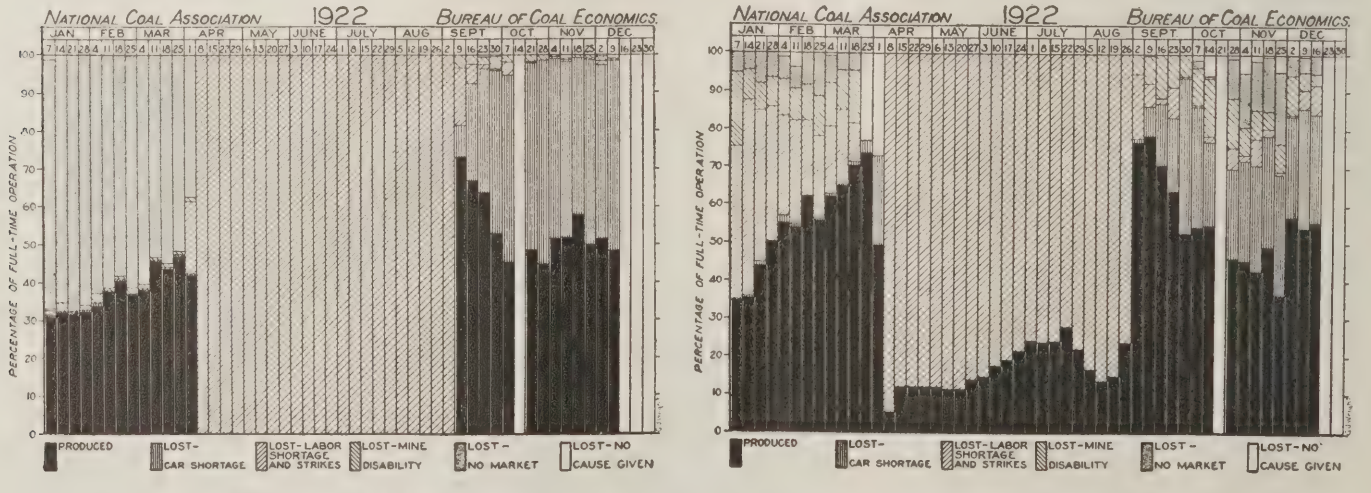
THE past year saw the coal market in Connellsville at the lowest ebb in history, then witnessed its sudden rise because of the demand resulting from the strike, and only to drop step by step after the strike was settled elsewhere. On Jan. 1 coal was quoted at $1.35 and when the strike went into effect it was at the same figure. Then by leaps and bounds it advanced to an $8 peak, reached on Aug. 15. From that point the price receded slowly day by day until it reached its present figure of $2.25, where it has clung for a month or more, and operators are strongly resisting any further downward moves.

The coke market reached its high point about the middle of August, when furnace coke was quotable at $14@$15 and foundry coke at $15@$16. The Cleveland settlement and the advance in wages in the Connellsville region caused a sharp drop and at the end of August furnace coke sold down to $10, for shipment over September. Idle furnaces were so anxious to get into blast that they bid the market up again to a secondary maximum of $12 late in September. Then the market declined at intervals to $6.50 at the middle of December, when a new influence developed, this being demand for coke for domestic use in the East as a substitute for anthracite, and the market took a sudden jump. As production of anthracite is over 2,000,000 tons a week and merchant production of Connellsville coke averaged about 75,000 tons a week in December, nearly all of this being under contract to furnaces, the domestic demand could easily swing the market. Whether it will be an influence throughout the winter depends chiefly upon the attitude of householders toward a fuel new to them and requiring somewhat different handling.

While the operators were dreaming of the biggest summer's run since the war ended they failed to see the spirit of unrest among their employees. Taking advantage of operators' confidence that their miners would not participate in any strike, organizers for the mine workers were sent into the region, got jobs at many of the mines and started planting the seed of unrest. One by one the great mines in the lower Connellsville region were silenced and in two weeks the strike spread to practically all parts of the field in Fayette County, but the union signally failed in making any inroads into the Westmoreland field.

The strikers are no longer interfering with plant operations and the market demand again is measuring the extent of production. But there is no disputing the fact that the Connellsville coal trade has suffered a permanent loss by reason of the fact that it now must take its place among other districts subject to labor disturbances.

Strike Was Shock of Years at Connellsville



Within Fortnight Coke Production Fell to One-Third Rate at Close of March—Coal Output Dropped Further—Wage Advance Following Cleveland Settlement Failed to End Trouble

By B. E. V. Luty

THE event of the year in the Connellsville region, of course was the strike. It was, indeed, the most startling event for many years. The 1922 strike at the union coal mines may have been a great event in its way, but that trade is accustomed to strikes. There have been various strikes in the Connellsville region, the last important one being in 1891. For several years thereafter the "mountain of coke" at the Edgar Thomson blast furnaces served to prevent a recurrence. Wages were advanced from time to time, and at rare intervals they were reduced for short periods. In general the rates were kept in harmony with those paid in the Pittsburgh district, with allowance for the much greater ease of mining. Even in the great iron and steel strike of Sept. 22, 1919, when the agitators sought to close iron-ore mines, coal mines and coke works, there was much less striking in the Connellsville region than at the mills and furnaces.

The Connellsville region scale of Sept. 1, 1920, was in harmony with the existing scale at the union bituminous mines, but wage reductions were made in 1921, resulting in a condition wherein at the beginning of 1922 the cost of producing coal was vastly less in the Connellsville region than at the union mines under the scale which the United Mine Workers sought to continue for the two years from April 1, 1922.

Within a fortnight after April 1 production of coke in the Connellsville and lower Connellsville region was down to one-third the rate at the end of March, and the production of coal for shipment had decreased still further. The strike was strongest along the Monongahela River, where most of the coal for shipment is produced, much of it moving by water. It was confessed by large operators that they had not expected the strike. There was evidence of careful planning on the part of the representatives of the United Mine Workers, who produced the strike, and there also was evidence that if some of the men responsible for the iron and steel strike of 1919 were not

Pittsburgh (Pa.) District — Kansas District

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

actively at work their precise methods at any rate were carefully followed.

Predictions were common that this "non-union strike" would not last nearly as long as the union strike. Like most predictions made about the strike, this proved erroneous. When the Cleveland settlement of the union strike was made the Connellsville operators advanced wages to the scale of Sept. 1, 1920, the highest ever paid in the region, except that outside day labor was set at a lower rate than in that scale. It was expected that the strike would completely crumble, but it did not. There had been gradually increasing production since the first month or two of the strike, and early in September, with the heavy demands upon the railroads to move union coal, the car supply in the region became such that additional workers were not particularly needed. From that time to the end of the year operations were controlled by car supply and market demand, but the "strike" continued in the sense that there were strikers, supported in part by the United Mine Workers. Obviously the object is to retain a nucleus if there is to be another union strike in 1923. This is a fact that should be considered in all discussion of the probability of there being a coal strike April 1, 1923.

Cincinnati Coal Trade Had Most Remarkable Year in More Than Decade

Many New Firms, Branches and Sales Offices Cause Notable Expansion in Tonnage and Territory Represented—Failures Were Not of Much Importance

By Harold W. Coates

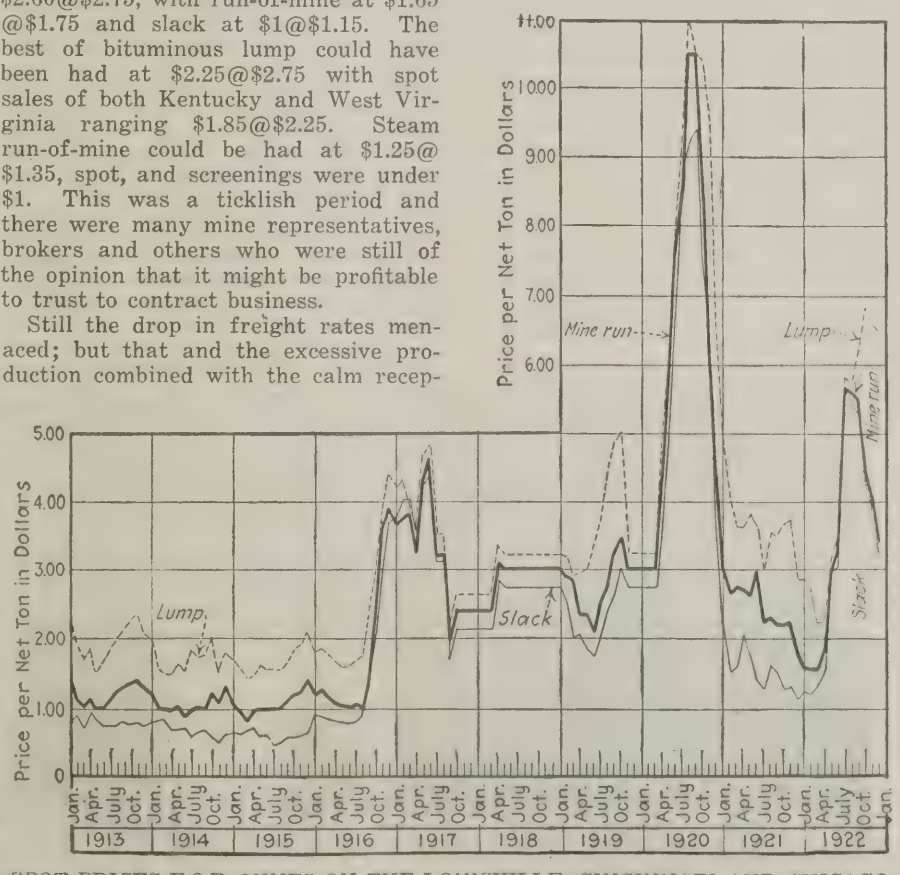
LEAVING aside all the questions inextricably bound up in the disputes that have arisen through the labor question, this has been the most remarkable year of more than a decade so far as the Cincinnati coal trade is concerned. Through the addition of a score or more new firms and the adding of branches and sales offices there are now doing business here over 100 coal firms whose shipments might well be traced from "dear old Lun'on to far off Cathay." The expansion of business through these new offices has increased in tonnage as well as to territory into which the coal has been poured.

It might also be said that each period of feverish activity has brought its flock of new concerns—each seemingly finding it necessary to have representation on the Cincinnati market or else finding this a fertile field in which to sow. Nor have the new firms been more largely of the jobber order, for quite a number of them are offshoots of mines that have opened in Kentucky and West Virginia who see advantage in having a medium for sale between the producer and the consumer.

On the other side of the ledger there are but few entries. One or two weak brothers have dropped out of the running, but they were either puny in character or weaklings to begin with.

The beginning of the year saw the trade in the doldrums with an after-holiday state of affairs that had put most of the takers of coal in a position of doubt. Even the menacing clouds of a labor dispute of magnitude failed to act as a bracer and January saw the domestic market the steam market and even the usual ready sale for smokeless slipping in quite alarming fashion.

On several occasions the price of slack sank below the dollar mark and there was a general effort on the part of most of the producers to hold lump firm and sacrifice on slack to prevent any great accumulation. It was in this period that one or two of the direct sales agents for mines here took the lead in slashing prices in order to keep their mines going. These to a degree set the pace, for their price lists were flooding the mails and were a counter argument to others who tried to hold the helm a bit steady.



During March the banner coals had dropped greatly in price. Smokeless lump and egg were being sold freely at $2.60@$2.75, with run-of-mine at $1.65 @$1.75 and slack at $1@$1.15. The best of bituminous lump could have been had at $2.25@$2.75 with spot sales of both Kentucky and West Virginia ranging $1.85@$2.25. Steam run-of-mine could be had at $1.25@ $1.35, spot, and screenings were under $1. This was a ticklish period and there were many mine representatives, brokers and others who were still of the opinion that it might be profitable to trust to contract business.

Still the drop in freight rates menaced; but that and the excessive production combined with the calm reception of the actual strike situation failed to arouse any great price stimulus for weeks. The beginning of May, however, saw a change in tone. Reserves were beginning to melt away.

From a position of waiting hat in hand in the outer office, the small producer down in the hills began to take on a new significance. His production was being solicited. War times and the after-armistice period made this figure in the trade business-wise. He was canny. He began flirting with the middleman and by June the most of them were packing their buyers off to producing points to deal for the coal as it came from the mouth of the mines. Wagon mines that had been hit by the inertia came to life with a bang.

From the last of May until the middle of June jumps in price of 50c. to $1 within a week were not uncommon and then Secretary Hoover stepped in with the stern order to desist.

Perhaps it is a bit harsh to recall that period—that is as it applies to Cincinnati—for there are still men who

SPOT PRICES F.O.B. MINES ON THE LOUISVILLE, CINCINNATI AND CHICAGO MARKETS OF COAL FROM SOUTHEASTERN KENTUCKY

found one week with apparently the sky the limit, with buyers in the field who were paying around $4@$4.50 for coal only to have Mr. Hoover put his foot down on the skyrocketing of prices. They found that the Secretary of Commerce was speaking to the buyer.

Meetings of the operators with Mr. Hoover resulted in the smokeless coals being placed upon a basis of $3.25 for slack, $3.50 for run-of-mine and $3.75 for lump. And it might be said here that this part of the trade kept faith with Secretary Hoover and the prices on that level.

The middle of July found Mr. Hoover's attention directed to the Cincinnati market by reports that the price had mounted to $4@$5 once more. This was the crucial period in which the government was forced to action, and with the open season for priorities, district managers and distribution agencies coming on there was the usual hurly-burly attendant upon the government's attempt to regulate trade without the machinery of the law to enforce the demands.

Then came the establishment of the new Hoover prices in the smokeless field, which took into account the fact that producers with selling agencies should be allowed brokerage fees. This brought the price up to $4.56 for nut and slack, $4.86 for run-of-mine and $5.13 for lump and egg. The Ohio Fuel Administration came into being soon after the government regulation of affairs; but through the fact that the larger amount of Cincinnati's coal was interstate this did not cut much of a figure until Governor Davis called a special meeting of the Legislature and passed an act legalizing this wing of the government. Even then it was pointed out to the Governor's agent, Mr. Neal, the Fuel Administrator, that the Cincinnati trade could not be held accountable, and about the only thing done here was to make a few of the retailers uncomfortable.

September and the closing of the labor trouble showed a general scramble for coal. Railways, which had been the chief cause of the upturn in price through their bidding for what coal was available, despite the system of priorities, were still heavy takers. The steel mills were in the market. Henry Ford made his famous declaration—even with his deal with certain groups of Cincinnati brokers in progress—and the price of coal steadily advanced.

It was in this period that the Lake shippers became heavy customers, though it is to be said that some of the tactics that were employed still have a strange twist to them.

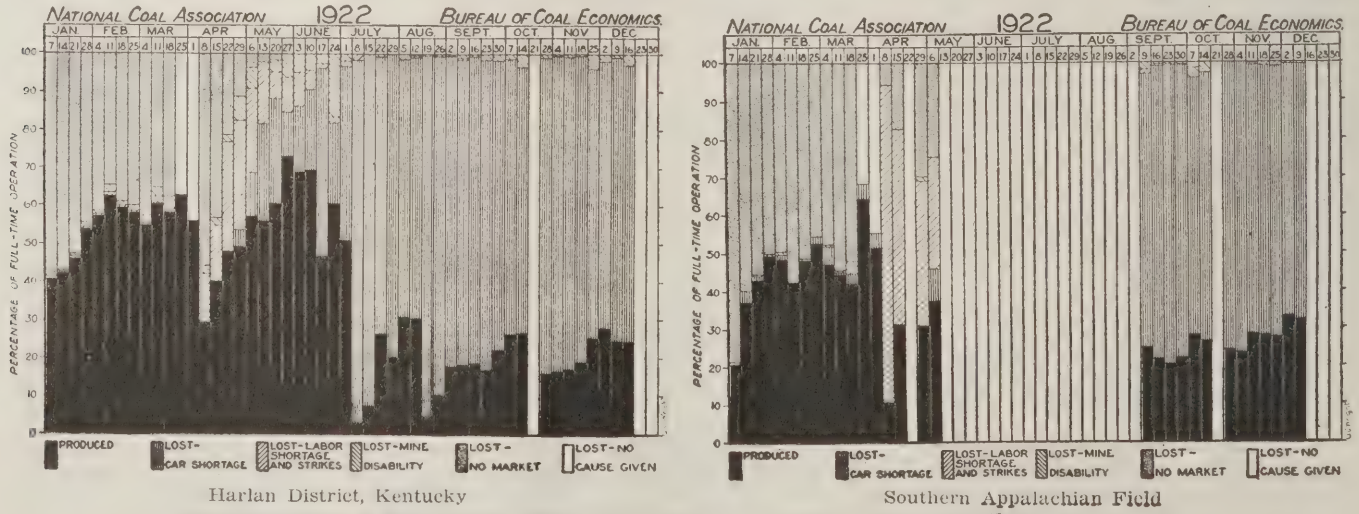
Even after the close of the Lakes there was a fine line of distinction made between coals that were for steam purposes and those that were used in the steel and byproduct plants with the latter taking anywhere up to $1 premium. The middle of November, however, saw the high values starting to wane. Several times the market settled with the prices easing off, only to recover an equilibrium that held out hope that bottom was being reached.

The railway situation to the south of the river has been muddled. The N. & W. and the L. & N. acknowledge that it will be months before there will be a complete recovery from the shopmen's strike. The C. & O. at one time was forced to embargo westbound coal in order to clean up accumulations.

The closing of the year saw a price range of ups and downs wholly out of line with any set precedent. The weather during the fore part of December was mild, and this with the usual accumulation at the Lake ports and a drop in the interest of buying for steel mills dulled the market. Then came a cold snap with an attendant tie-up of transportation, and with the country taking coal from hand to mouth this had an immediate effect. For the first time in months $2.50 coal was on record and then the price immediately swung upward again until Christmas saw it hovering around the $4 mark.

In Southern Ohio 1922 Was Not a Good Year

Operators' Profits After Strike Not Sufficient to Counterbalance Previous Losses—Many Jobbers Made Handsome Profits—Retailer's Path Beset with Difficulties—Output Lowest Since 1915



By J. W. Lehman

THE year 1922 was not a good one for the coal industry in the Buckeye State. Many things mitigated against a better and more profitable year, principally the strike. For the operator it was a bad year and while some huge profits were made following the settlement of the strike, still these have not been sufficient, in most cases, to counterbalance the losses previous thereto.

From the jobber's standpoint the year was a good one in many respects. During the first three months wholesalers were able to handle a fair tonnage at small margins, but with the declaration of the strike they began to take an active part in the business. Coal from the non-union fields of West Virginia and Kentucky came into the state and jobbers in many cases made handsome profits.

The retailer had a fair year as a rule, although it was beset with many difficulties. One of these was the Ohio Fuel Administration. This administration fixed retail profits at a time when profits would naturally have been larger. But on the whole the retailer has little complaint to offer.

Statistics of the Southern Ohio Coal Exchange show an opproximate output in Ohio during the year of 25,650,000 tons. This estimate is based on the production up to Dec. 1 and an estimate of the last month, which is placed at 3,000,000 tons or more. The output in 1912 was 34,444,000 tons; in 1913, 36,285,000 tons; in 1914, 18,736,000 tons; in 1915, 22,627,000 tons; in 1916, 34,526,000 tons; in 1917, 41,678,000 tons; in 1918, 47,919,000 tons; in 1919, 35,226,000 tons in 1920, 45,227,000 tons and in 1921, 29,065,000 tons.

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

While the strike was predicted for some time the usual stocking up on the part of steam users was not as heavy as in some former years when strikes were called. This is due to the fact that stocks were already large and also to the business uncertainty of the future.

The year opened with low prices and there was nothing outside of the threatened strike to stimulate the market. As a result lump was sold around $2.20@$2.50 during the entire time. Mine run was rather weak, selling at $1.60@$1.85 and screenings, $1.50@$1.85. Just previous to April 1 there was a slight increase, but this was almost negligible.

Little effect on quotations was noticed for the first 45 days of the strike. But by May 15 there came a bull movement and prices advanced materially. This state of affairs continued right up to the settlement and immediately afterward, when the extreme high prices of the year prevailed. The Ohio Fuel Administration came into being and fixed prices to be paid at the mines in all of the producing fields of the state. This was not brought about until fully five weeks after the strike and operators shared in the big quotations as a rule up to that time.

Ohio prices were originally fixed at from $3.56@$4.86 for mine-run. The provision of the administration was that prepared sizes would be 25c. higher while screenings were 25c. lower than those levels. In all there were nine mining districts in the state according to the plan of the Ohio Administration.

These prices were considerably lower than current quotations and consequently the larger part of the production was shipped out of the state. To supply the deficit West Virginia and Kentucky varieties were shipped into Ohio at fancy prices and the consuming public was not benefited materially by the fixation of prices. Many complaints were received from the public when the administration permitted operators producing lumps "Especially prepared for domestic use" to charge 50c. more than the former schedule. This had the effect of retaining a larger proportion of the Ohio output for Ohio users.

At the close of the year stocks in the hands of retailers were only fair and in some cases shorter than usual at the time of the season. This was because householders were not buying actively, preferring to place small orders in the belief that lower prices would prevail after the first of the year. Retailers were loath to stock up on high-priced coal and consequently the policy was to conduct that business from hand to mouth. Stocks in the hands of steam users were somewhat larger, variously estimated at from 30 to 60 days. In some instances even shorter stocks were carried, as steam users also had the idea of cheaper coal until the final break just before the end of the year.

With colder weather producers, distributors and dealers believe there will be a steady demand for domestic sizes during the early part of the year. But the steam market is not looked upon in the same way and it is believed that prices for mine run and slack will continue at a rather low level for some time to come.

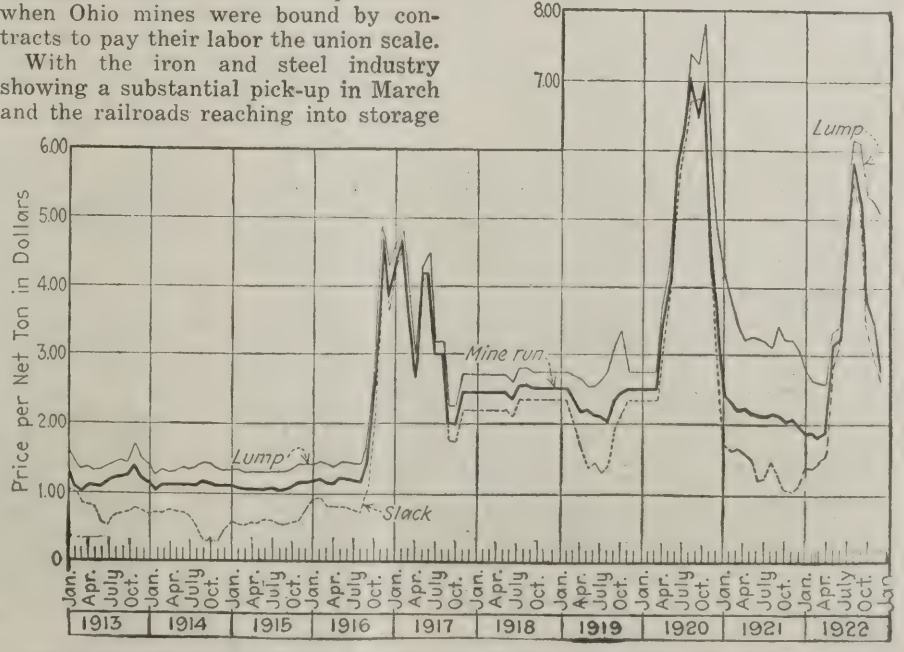
Eastern Ohio Had Many Tribulations in 1922

Potential Loss of 12,000,000 Tons Production Due to "No Market," Miners' Strike and Car Shortage—Bargain Counter Coal Prices of January and February Failed to Stimulate Buying

BY K. M. PINAIRE

OPERATIONS in eastern Ohio perhaps experienced during 1922 a greater variety of tribulations than ever before. The year began with coal prices lower than had prevailed in many months, but this price range which proved to be the bargain counter of the year failed to stimulate much buying on the part of a convalescent industry. Large users, such as public utilities, railroads and steel mills, had not made appreciable inroads on their reserve stocks and considerable optimism prevailed that impending labor troubles at the mines would in some way be settled so as to result in lower production costs.



During the first quarter of the year mines worked less than 50 per cent of full time, the only factor of any significance hindering production being "no market."

In an effort to create more work for Ohio miners the Governor of the state in early February appealed to consumers throughout the state to confine their purchases to Ohio coal, and particularly urged municipalities and public utilities to heed his suggestion. However, lower production costs at nonunion mines to the south made this program difficult of accomplishment when Ohio mines were bound by contracts to pay their labor the union scale.

With the iron and steel industry showing a substantial pick-up in March and the railroads reaching into storage tracks pulling empties to take care of increased traffic all-round, coupled with increased fuel demand for storage purposes, mining operations were stimulated to the highest point of the year, and by the end of the month consumers in this section had enough coal on hand to last anywhere from forty to ninety days.

During the strike period, the majority of stripping mines in the district continued to operate and produced between 30,000 and 60,000 tons per week. While the stripping coal was able to supply fuel in many emergency cases, quite a few large consumers located contiguous to the lower ports protected their situation by acquiring cargoes from steamers which had already been loaded and were awaiting the opening of Lake navigation.

Likewise, others moved to nearby cross-Lake ports to replenish weak spots in coal reserves. Not until early July did there appear any real anxiety, as by that time stripping and nonunion coal began to prove inadequate. The effect of this scant fuel supply brought reports of hampered operations of steel mills and banking of furnaces in the Youngstown and Mahoning

* Stripping mine output April 1 to Aug. 17 estimated.

Valley districts and the Detroit & Cleveland Navigation Co. sought relief by enlisting the aid of Secretary Hoover. With a shortage becoming imminent, prices hit the high level of the year.

By the middle of July Cleveland's coal supply became such a matter of concern that the Chamber of Commerce appointed a committee to cope with the situation. During the same month several injunctions were granted through the Federal District Court restraining union miners from interfering with stripping-mine operations and the arrival of National Guard caused an immediate increase in stripping output.

Coal had become so scarce by early August that vessel operators were reported to have paid in some cases as much as $10 per ton for bunker coal. On Aug. 16, as result of the Cleveland joint conference, telegraphic instructions were sent out to local unions and machine men began cutting coal in easten Ohio on the 17th.

Spot prices then dropped $1@$2. Despite the prolonged strike, no widespread demand appeared and the procrastinating attitude of buyers was again bolstered up by the appointment of an Ohio Fuel Administrator and the fixing of maximum prices on coal from the various fields. Price regulation became effective Oct. 10, maximum figures f.o.b. eastern Ohio mines being as follows: Slack, nut and slack, $3.31; mine-run, $3.56; lump, $3.81.

Effective Nov. 15, increases were allowed on lump sizes, resulting in the following range: Lump, 1¼ in., $3.81; lump, 2 in., 4 in., 6 in., $4.31.

Before all price restrictions were removed Dec. 1, demand had subsided and spot prices had receded to figures below the state maxima. A review of spot prices prevailing throughout the year reveals that the lowest figures prevailed during the first quarter, when the range was about as follows: Slack, $1.50@$1.90; nut and slack, $1.65@$1.90; mine-run, $1.75@$1.95; lump, $1.85@$3.

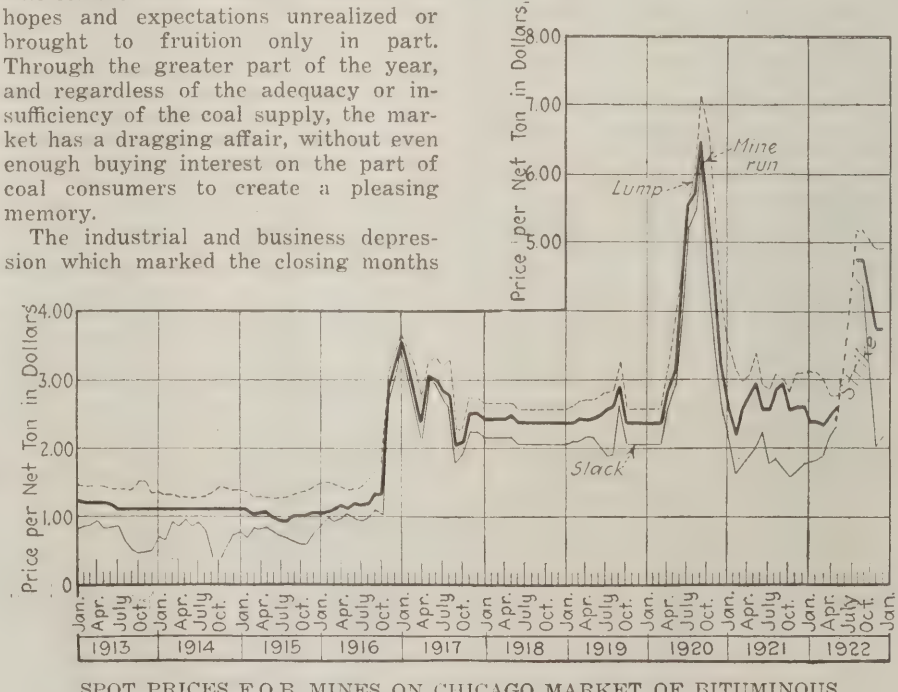
Detroit Had Year of Disappointment in 1922

Market at No Time in Healthy, Normal Condition—Influences Outside the Industry Had Depressing Effect—Hopes of Jobbers and Wholesalers Unfulfilled



By E. E. Dunbar

As a whole, the twelve-month just ended was a period of disappointment for representatives of the coal trade in Detroit. From the opening to the close of the year there was perhaps no time when the local market could be considered as in a healthy, normal condition. At various times throughout the year the coal business suffered from the restrictive influence of depressing events, some of which were a development outside of and apart from the industry.

To most of the Detroit jobbers and wholesalers 1922 was an interval of hopes and expectations unrealized or brought to fruition only in part. Through the greater part of the year, and regardless of the adequacy or insufficiency of the coal supply, the market has a dragging affair, without even enough buying interest on the part of coal consumers to create a pleasing memory.

The industrial and business depression which marked the closing months of the previous year was carried over into the early part of 1922. Many industrial consumers were carrying reserves of considerable magnitude, so also were many of the retail dealers. This condition was not altogether a result of overliberal buying in the preceding months but was rather the natural outcome of a reduction in consumption.

The sluggish state of the market continued well into March, with the railroads and public-utility companies supplying the chief buying power, though

December	4 92	3 72	2 17

even these purchasers indicated a curtailment of requirements.

Not even the strike news possessed sufficient galvanic power to rouse the coal buyers from the apathy into which they had fallen. Only a few of the steam buyers exerted any active effort to add to their stocks and in the case of some of these the attempt was made too late to be productive.

Another factor in the situation which was an influence in preventing any rush of buyers preceding the miners' strike was the fact that a considerable number of steam plants during the early months of the year had been obtaining most of their supply from the non-union mining districts of West Virginia and Kentucky. Because of its generally high quality and the lower cost of production, this coal had almost driven out of the market the product of the union mines. Among buyers the expectation was generally encouraged that these non-union mines would be able to continue adequate production during the strike.

The unforeseen complications injected into the situation by the closing of a number of these mines in districts where the union organizers had been busy, and by the strike of railway workers, brought to the local market in the late summer a brief period when buying demand was perhaps the most active of the year, with supply at the lowest level.

With the resumption of union production, the volume of buying demand eased off. The reversion to a sluggish market was attributed to unwillingness of either users of steam coal or retail dealers to pay the prices imposed by the operators of the reopened union mines.

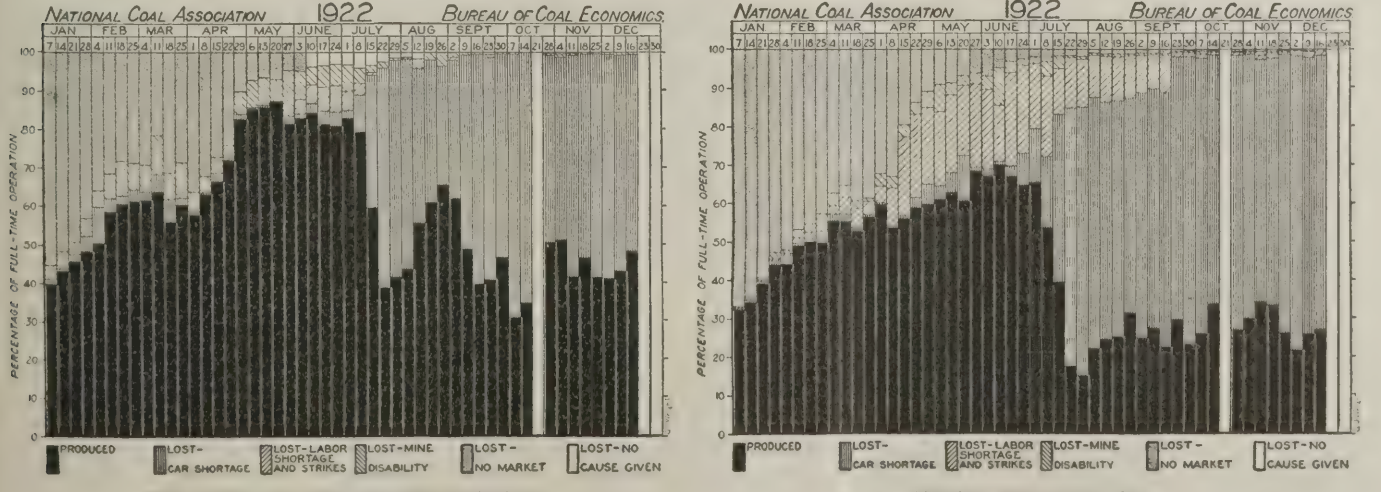
The attitude of the buyers doubtless was encouraged to some extent by a statement issued by Henry Ford, who urged coal buyers to limit their purchases to the quantities actually necessary to supply current needs.

This attitude apparently has been maintained through the last three months of the year. Its efficacy as a means of lowering mine prices is still somewhat in question.

In the intervening weeks, however, there has been some reduction of mine prices. Hocking lump, quoted around $6 early in October, is now about $5.50 and mine-run is down from $4 to $3.50, while nut, pea and slack have eased off from about $3.50 to $2.75. West Virginia and Kentucky lump has declined from $7 to $5.75; mine-run from $4 to $3.50 and slack from $4 to about $3. Smokeless, with supply limited, is still holding around $8 for lump and egg and $6 for mine-run.

These prices show a considerable advance from the lowest of the year, in late March, when West Virginia 4-in. lump was obtainable at $2.50; egg at $2; mine-run at $1.50 and slack at $1.30. Three-inch Ohio lump was then quoted $2.75; egg, $2.25; mine-run, $1.85; slack, $1.50. Smokeless lump was $3.25; mine-run, $2, and slack, $1.50. A month after the opening of the strike, or about May 1, smokeless lump and egg was obtainable at $3.75 and mine-run at $2.40. West Virginia and Kentucky lump was held at about $3; mine-run at $2.50@$2.60 and slack at $2.40.

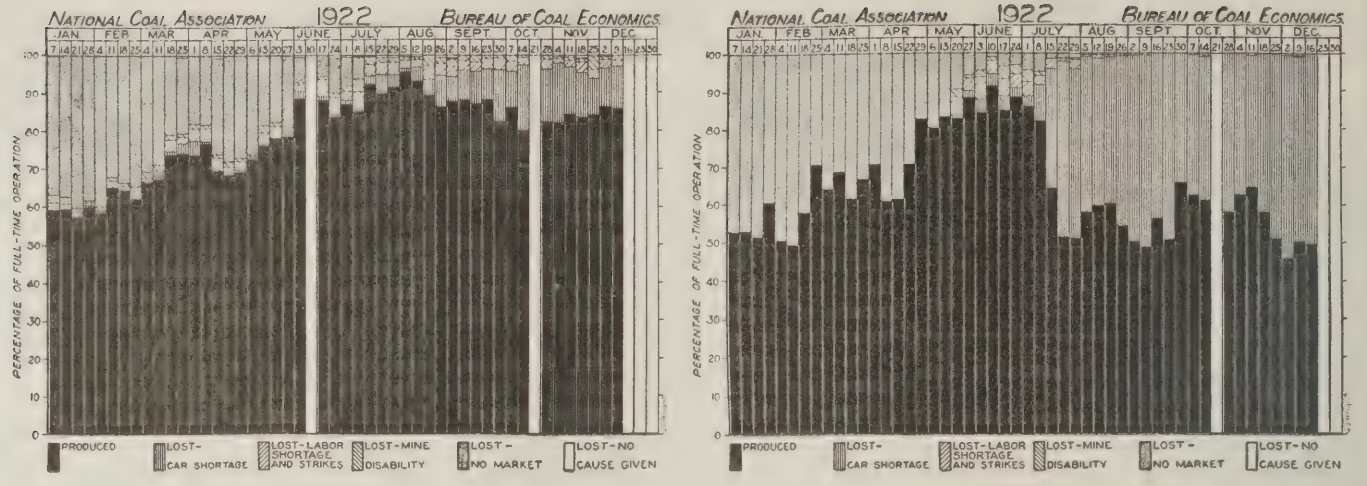
Alabama Market Had Good Year, But Progress Was Not as Great as Expected



As This Region Operates on Open-Shop Basis, Strike in Central Competitive Field Proved a Boon—Production Reached Peak of 400,000 Tons per Week.

By H. B. McLaurine

ALTHOUGH trade conditions in Alabama did not show the degree of progress toward normalcy which was expected following the previous year of extreme dullness and lack of demand for fuel, the market might be rated as having been fairly good, considering the adverse circumstances affecting production and consumption. Some improvement in the industrial situation was noted; railroads and other utilities required an increased tonnage, and as a result of constantly increasing activity in furnace operations and better demand for foundry products as the year wore on, the need for furnace and foundry coke was greater and the consumption of coal in coke manufacture was much heavier than during 1921.



Bunker and export trade did not show material improvement and the amount of coal moving to the Gulf ports was perhaps no greater than during the previous year. Slow recovery of shipping and the increased use of oil as motive power contracted the need for bunker fuel, and the further utilization of hydro-electric power reduced coal requirements at inland points to some extent.

During the first two and a half months of the year there was little demand for commercial coal. The latter part of March the railroads and some industrial interests bought considerable coal for stocking in anticipation of the strike, which temporarily stimulated the trade, and the negotiation of contracts for railroad, industrial and domestic coal through April, May and June tended to stabilize operations. Inquiry for spot coal in the meantime was fairly active, the requirements being about equal to the supply of free coal available. Consumers not covered by contract maintained throughout the

year a policy of providing only for needs of the immediate future.

During the latter part of June railroads in the North and West, which had practically exhausted the large surplus stocks accumulated prior to the strike in the union fields, turned to this market for coal and bought heavily over a period of about two months, a good demand also developing from industrial sources in the same territory. This movement continued until the strike settlement was effected in the Central Competitive field and proved a decided boon to the industry in this district, which experienced no labor troubles, operating as it did on the open-shop basis. Production reached a peak record of 400,000 tons per week, consumers in normal Alabama territory in the meantime being amply supplied and suffering no ill effects from the foreign movement. The commercial market during the remainder of the year was easy, but requirements were ample to take care of the restricted production caused by a drastic car shortage which immediately followed the cancellation of foreign business and the withdrawal of equipment which had been furnished the mines in unlimited quantity to move the emergency tonnage.

SPOT PRICES F.O.B. MINES ON THE BIRMINGHAM MARKET OF COAL FROM ALABAMA FIELDS

Demand for domestic coal was good practically throughout the year, there being strong pressure the greater part of the time, with only a few brief periods of lessened activity. Suspension of operations in union fields created a market for considerable tonnage in portions of Georgia and Mississippi formerly supplied from Tennessee and Kentucky mines, thus expanding dependent territory. The activity of the market was occasioned by a shortage in supply and wider distribution.

Periods of dullness in the steam trade materially reduced the normal output at commercial mines from which practically 75 per cent of domestic sizes come, car shortage and crippled transportation conditions incident to the strike curtailed production at all operations, and there was little chance for dealers to acquire reserve supply.

SPOT PRICES, F.O.B. MINES, OF BITUMINOUS COAL FROM BIG SEAM DISTRICT, BY MONTHS, 1922

QUOTED ON BIRMINGHAM, ALA., MARKET

	Lump	Mine-Run	Washed Slack
January	$3.02	$2.05	$2.14
February	2.82	1.85	2.04
March	2.47	1.85	1.85
April	2.00	1.70	1.85
May	2.00	1.70	1.95
June	2.20	1.84	1.85
July	2.79	2.67	2.79

September	3.97	3.17	3.59
October	3.67	3.32	3.04
November	3.95	2.35	2.60
December	3.95	2.41	2.60

Quotations on steam grades began to ease in January and suffered a slight gradual reduction until June, when they began to stiffen again with the coming of inquiry from outside territory and the eventual placing of orders for heavy tonnage for foreign shipment. The demand from the North and West became so strong that quotations for spot mine run and washed coal rose rapidly, ranging $5@$7 at the peak of the movement, and spot domestic brought similar figures in nearby territory.

In an effort to stabilize market conditions producers representing the majority of the tonnage in the field agreed to abide by prices fixed by Secretary Hoover, which were based on a 25c. reduction on the old government schedule, but as most of the coal available for the spot trade came from small operations, many of which began to function with the development of the emergency demand, coal moving to foreign territory continued to bring a large premium over the fixed schedule

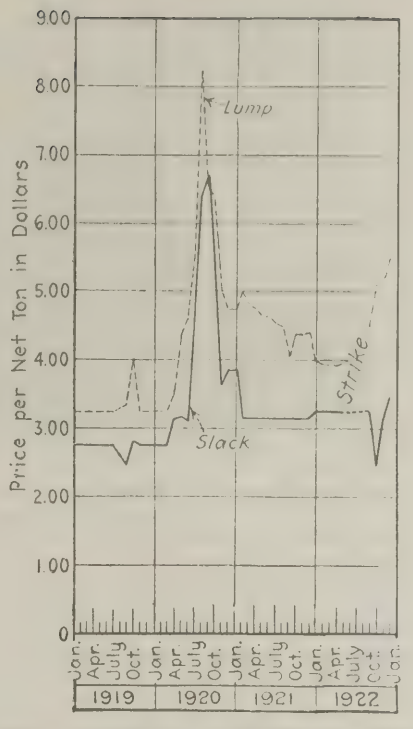
Note:—July schedule fixed by Mr. Hoover, effective July 27; September schedule fixed by state, effective Sept. 1.

until the pressure was relieved by the resumption of operations in the union fields and quotations gradually receded to government figures. Due to an increase in wages granted mine labor as of Sept. 1 the State Fuel Administration fixed a new schedule of maximum prices for steam and domestic coal to absorb the additional cost of production, which ruled for the balance of the year, the easy commercial market bringing about some decrease from the maximum prices for that grade of coal.

New development work and improvement of producing facilities during the year included the new Overton mine of the Alabama Fuel & Iron Co., in the Cahaba basin; Dixie mine of the Moffatt Coal Co., in Bibb County; the Black Creek & Valley Coal Co., and the incorporation of the Etowah Coal & Iron Co., for the development of properties in Marshall and DeKalb counties, and an extensive stripping operation in Tuscaloosa County.

Completion of the $400,000 coal terminals of the federal government at Mobile added greatly to the facilities for storing bunker and export coal and the speedy bunkering of vessels coaling at that point. Coal-carrying equipment on the Warrior River was supplemented and indications point to a more extensive utilization of water transportation during the coming year.

At this time no accurate figures on production are available but it is estimated that the output for the year will run between 16,500,000 and 17,000,000 tons, or a gain of 3,500,000 to 4,000,000 tons over 1921. Coke production is a difficult matter on which to venture an estimate, but it probably will be around 4,500,000 tons, or an increase over last year of approximately 1,500,000 to 2,000,000 tons.

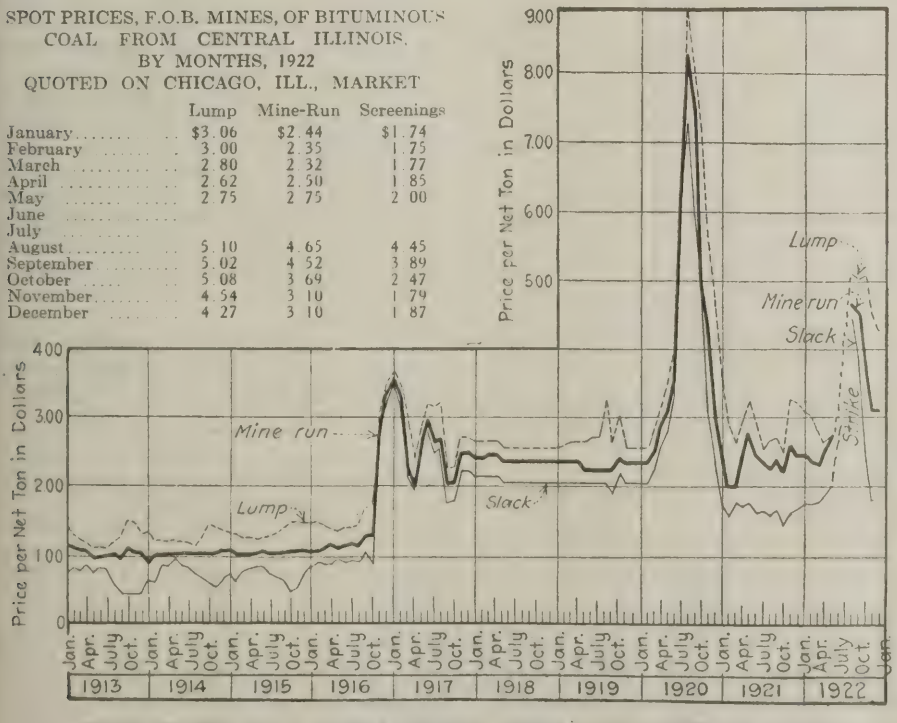


Chicago Has Feast-and-Famine Twelvemonth

Enters Strike Period Quietly Enough but "West Kentucky Riot" Upsets Everybody and Everything—Post-Strike Market Calm and Buyers' Hold-out Run to End of Poor Rail-Service Year

NO MORE perfect demonstration of the "feast-and-famine" character of the coal industry has been given the coal trade of Chicago than that offered by the year 1922. Opening on a quiet market that persistently refused to get excited about the approach of the general strike of April 1, the year progressed through a slight market agitation just before the strike, moved on into a summer that started stagnantly but wound up in a hectic late July bartering for western Kentucky and non-union coal whose prices bounded skyward when the country's immense coal reserve began to show bottom, entered next into an autumn that deflated whatever boom tendencies followed the close of the strike in August, and reached a grand finale in December which disappointed almost everybody who sold coal.

Most Indiana and Illinois producers, more than 100 of whom have headquarters in Chicago, finished the year fairly well out of the red, but none was rolling in wealth and it must be said truthfully that a few had not been able to recoup the losses incident to the strike. A number turned their sales organizations into jobbing agencies during the shutdown. There was more of this sort of thing than the city has seen in a long time. It was the only means of keeping a few heads above water. Regular wholesalers went through the usual experience of a strike year. They speculated at every opportunity and for a few weeks just after the middle of the strike period their plunging was rewarded with gold. But the uncertainty of the market caused enough of them to get their fingers scorched so that no 1920 "gold rush" was experienced. The slack autumn and early winter market was hard on jobbers, even though 75 per cent of the Chicago trading was on the open market.



Price restraint exercised through the latter half of the strike period by Secretary Hoover over practically all non-union coal except that to be had in western Kentucky and the general effort of railroads and big consumers to combine against bloated markets had their effect in Chicago as well as elsewhere. The organization of a "buying pool" of railroads, under advice of union operators here whose mines were down, worked fairly well for awhile. It prevented a good deal of bidding in the fields; but it did not last. The "pool"

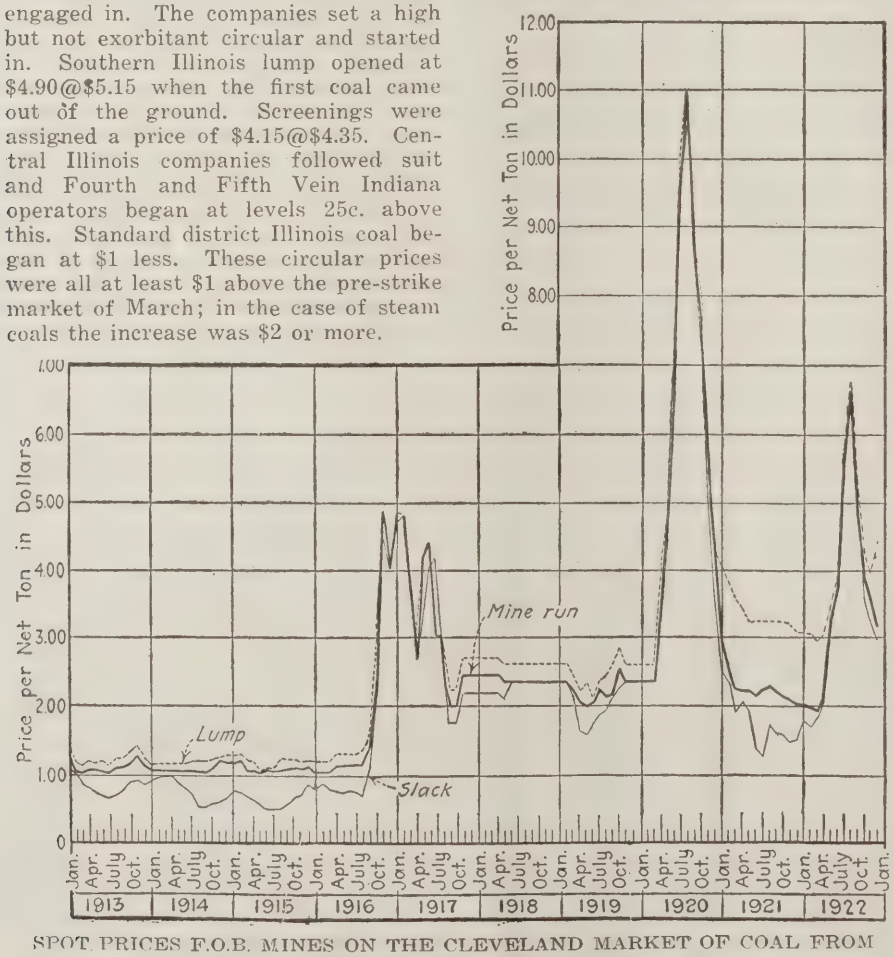
PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

sundered by internal dissention and many of its members finally joined in the short but exciting rush for coal in western Kentucky which hoisted that fuel from $4.50, mine run basis, to as high as $10@$12 on the Chicago market in the last weeks of July.

By the time the strike ended, Aug. 15, western Kentucky had slumped badly, and a few Chicago men with high-priced contracts were in hot water. Then violations of contract had their turn and the market was upset generally.

At the outset of new production in Illinois and Indiana following the strike the usual sparring for position was engaged in. The companies set a high but not exorbitant circular and started in. Southern Illinois lump opened at $4.90@$5.15 when the first coal came out of the ground. Screenings were assigned a price of $4.15@$4.35. Central Illinois companies followed suit and Fourth and Fifth Vein Indiana operators began at levels 25c. above this. Standard district Illinois coal began at $1 less. These circular prices were all at least $1 above the pre-strike market of March; in the case of steam coals the increase was $2 or more.



Of course by this time western Kentucky's flight was over. Coal from there at once resumed its normal practice of undercutting the market, and before autumn had advanced far western Kentucky lump was passing $4 on the way down, and remained that low to the end of the year, while its screenings dropped to $1.50. On the other hand Illinois and Indiana domestic coals went into October at a 50c. advance, though the steam market remained slow and screenings descended.

Continued warm weather and the presence of cheap western Kentucky coal which big buyers were ever ready to use as a club on the better fields of the Middle States, kept the market at low ebb after the first few weeks of operation. The advice of the government and the United States Chamber of Commerce against stocking of steam coal had a double effect in the Midwest region as generally.

When dealers' yards began to overflow and household buyers throughout this region quit purchasing in the hope that the price would drop, there settled down over the market in November another lull which shot prices to pieces except in the cases of exceptionally good domestic coals. These continued to maintain the $5.50 circular with some degree of stability. Central Illinois and Standard district domestic sizes dropped $1, however, and demand at times was so light that the fields choked with "no-bills" and large shipments were dumped out at the mercy of spot buyers who knew not the meaning of the word.

The steam market during early November softened noticeably. The best screenings Illinois produced sank to $2.15@$2.25 and those from various fields to $1.25. The volume of screenings which went on the ground at mines was considerable. But even this device to free cars for domestic coal did not keep all mines working. Because of general slackness, the domestic market did not, for awhile, absorb all the output at the reduced prices, a condition which continued in lesser degree through a cold snap or two right up to the end of the year.

This unsatisfactory condition held through a period of car shortage which cannot be regarded in any other light

than as a godsend to the operators. At the resumption of mining there were, of course, large numbers of coal cars in the mining fields ready for business. As soon as this supply was scattered to the four winds a shortage settled down immediately, not so much because of lack of cars as for general disability of railroads as they came out of their shopmen's strike.

The general and surprising autumn dullness drove the more ambitious producers and wholesalers to extend the territory dominated or affected by Chicago as no other one influence ever had done before. This extension was mainly into the Northwest, where competition with the docks became keener than usual.

These factors contributed to reduce materially the volume of coal normally handled into and through the Chicago switching district. In view of this and the fact that Cincinnati during the strike period became the coal center of the country, thanks to its proximity to heavily producing non-union fields, Chicago can hardly claim for 1922 its undisputed title as "the world's greatest coal market."

It is observed by Chicago traders that many a buyer is counting on the government to prevent a strike next spring, or at least to make its duration short, and, further, there seems to be a general belief that the railroads will not again get into such a jam that they will cut off so large a slice of the potential non-union mine production as was deducted from the country's available coal last summer. This attitude, plus general industrial quiet, is regarded by many in Chicago as presaging a lean coal year for 1923, at least until next autumn.

St. Louis Observes Need for a "Coal Moses"

Year's Wilderness of Uncertainty Kept Everybody Wandering —Retailers and Operators Make Little Money but Some Jobbers Get Rich—Year Effects Many Distribution Changes

BY E. J. WALLACE

THE experiences of 1922 in the St. Louis market prove only one thing: The Moses of the coal industry is yet to appear.—And he is badly needed. All tried and trusted signs and omens fail in the battle of the workers and the "worriers" as the coal industry stands now. They failed so often during 1922 that the luck of the year was oddly spread around. The year has not been a good one for retailers. The jobbers had the time of their somewhat checkered careers and made money. Among the operators, some fattened and some didn't in playing the St. Louis market.

Illinois coal lost out in Missouri. In the southeastern part of the state western Kentucky and Alabama got a good foothold along the Frisco lines. This same applies to eastern Arkansas and eastern and northern Louisiana. No more Illinois coal moves to Texas, with an exceptional car here and there. Kansas coal is getting in solid in southwestern Missouri, with Alabama a close second. All over Missouri little "gopher" hole mines have opened up and some pretty good strip mines. This tonnage has put Illinois coal out of some cities entirely.

Arkansas coal failed to reach St. Louis in 1922, and diminished in tonnage to other Missouri points, outside of Kansas City and St. Joseph. Less than 50 per cent of the normal volume of hard coal came through from Pennsylvania. Alabama byproduct coke moved in to replace anthracite in chestnut size.

As usual, the new year opened in St. Louis and surrounding country under trying conditions. The market had been soft as the year closed and warm weather almost put the finishing touches on what market remained. The only coal moving was the cheapest kind, although there was an abundance of everything in fuel available.

The local retail prices were: Carterville, $7.50@$7.75; Mt. Olive, $6.50; Standard, $4.75@$5; smokeless, $12.25; anthracite stove, $15.75; anthracite chestnut, $16; anthracite grate and egg, $15.50.

Coal at the mines was: Carterville lump, $3.25@$4.05; Carterville egg, $3.25@$4.05; Carterville No. 1 and 2 nut, $2.75; Carterville mine-run, $2.75 @$3; Carterville screenings, $1.90@ $2.25; Mt. Olive lump, $2.75@$3.50; Mt. Olive mine run, $2.25@$2.75; Mt. Olive screenings, $1.85@$2.10; Standard lump, $2.75@$3; Standard mine-run, $1.90; Standard screenings, $1.25@ $1.50.

The rate on Standard and Mt. Olive to St. Louis was $1.27½; Carterville, $1.48½, and Duquoin, $1.35. East St. Louis and Granite City were 29c. less than this.

Country call was quiet. Dealers everywhere had full yards and steam plants were pretty well stocked. The railroads had started storage piles and there was no scarcity of fuel anywhere.

Up to Jan. 1 the temperature at no time had been under 26° and it was not real winter weather for St. Louis and domestic users bought only as they needed, in small quantities. With February colder weather prevailed, and this helped a little, but nothing like a seasonable winter prevailed.

Storage coal went in slowly and with no alarm. For once the coal buyer had the situation completely in his hands. He played the game as he cared to and the coal trade was helpless. On April 1 the strike came on. Almost everyone figured a 60 to 90 day suspension They stored accordingly except a few railroads, whose blindness to take a 90-day chance was costly later.

About May 1 the railroads began to buy freely of western Kentucky coal at from $2.10 to $2.40 for mine-run. By May 15 the price had advanced $1. This was followed by a slight slump, but July 1 saw western Kentucky mine-run at $4.25, lump at $4.50 and screenings at from $4.25 to $4.50. In July Alabama coal began to move in at from $2.25 for mine-run up to $3.50 on screened coal, with a rate of $3.67. The Kentucky coal had a rate of about $1.87. The last of over 100,000 tons of coal stored on the ground at East St. Louis and other places was cleaned up. This last lot sold at over $6 mine basis.

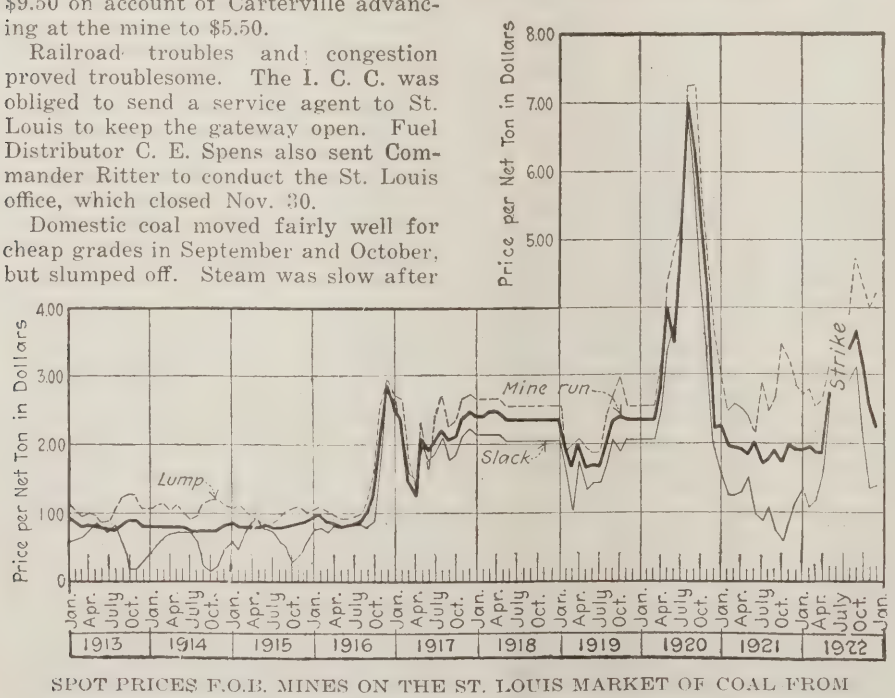
	Lump	Mine-Run	Screenings
January	$2.72	$1.91	$1.36
February	2.79	1.92	1.09
March	2.55	1.86	1.19
April	2.65	1.85	1.57
May	3.15	2.75	2.75
June	...	...	...
July	...	...	...
August	3.90	3.40	2.90
September	4.74	3.64	3.11
October	4.37	3.16	2.13
November	4.00	2.55	1.35
December	4.21	2.26	1.39

In July the railroads began to get jammed up on account of the shopmen's strike and a serious several weeks followed. A little Missouri coal from Moniteau County came in as a lifesaver from then on until the end of the strike, but in small lots.



In August the question of coal for hotels and other domestic users became a problem, resulting in a fuel distributing commission for Missouri with city and county committees. The situation became serious and resulted in some plants suspending though public utilities kept going. Coal was brought up from western Kentucky on barges for the first time in years.

With mines resuming on Aug. 23 the situation eased up rapidly. Buying in St. Louis was only for actual needs, for there was a good tonnage of Alabama in transit at $5@$8 at the mine for mine-run and between 1,500 and 2,000 cars of western Kentucky at $7@$8, and some as high as $11. Standard 2-in. lump opened up at $3.50@$4, with all other sizes about the same. Mt. Olive for St. Louis was $4 for domestic sizes. Outside shipments ranged to $5. Carterville averaged $5 for domestic and steam sizes. Retail prices averaged: Standard, $6.75; Mt. Olive, $7.50, and Carterville, $9. These prices remained for the year excepting Carterville, which advanced in September to $9.50 on account of Carterville advancing at the mine to $5.50.

Railroad troubles and congestion proved troublesome. The I. C. C. was obliged to send a service agent to St. Louis to keep the gateway open. Fuel Distributor C. E. Spens also sent Commander Ritter to conduct the St. Louis office, which closed Nov. 30.

Domestic coal moved fairly well for cheap grades in September and October, but slumped off. Steam was slow after the first few weeks of operation following the strike. Storage at the close of the year was well under way in a most intelligent, well-planned movement by the big buyers. They kept the market down by slow buying.

From Nov. 1 the market was in bad shape and prices weakened. Standard 2-in. lump went down to $2.50, 6-in. lump to $3.25, steam nut and egg $2.25, mine-run $2.25, screenings $1 to $1.25. Mt. Olive held its price. Carterville slipped only by the independent operators. The association shippers held to the $5.50 domestic size price. Screenings in that field got down to $2 at times. In December there was a comeback on Standard, with the colder weather. The first cold weather came on Dec. 11, with a temperature of 20 deg. above, and no snow. The winter looked as if it would be an open one. Dealers' bins were loaded by Dec. 1 and no one buying. The railroads began to store up and public utilities were in good shape.

SPOT PRICES F.O.B. MINES ON THE ST. LOUIS MARKET OF COAL FROM STANDARD FIELD OF ILLINOIS

At Head-of-Lakes 1922 Exactly Reverses 1921

Season Opens with Docks Full—Public Counts So Heavily Upon Stocks That It Refuses to Buy Until Fall Famine Fright Spreads Trouble—Real Shortage Threatens Before Opening of Navigation

BY S. M. CHAMBERS

A GOOD idea of 1922 at the Head-of-the-Lakes can be gained by merely reversing the reports of everything that happened in 1921. The two years are as diametrically opposite as could possibly be. The Northwest faces almost surely a coal shortage before the opening of navigation in the spring. Anthracite is already gone, and users are turning to substitutes. Bituminous coal seems to be plentiful at present, but there is little doubt that the coal administrator at St. Paul will enlarge the territory served by Duluth, and that stocks will be depleted before the summer comes.

Until the opening of navigation this year there was little to feature the coal market at the Head-of-the-Lakes. The only noticeable signs of the general trend were sags in the market. Prices of both bituminous and anthracite fell off steadily from the first of the year to the opening of navigation. This was caused in the main by the well-stocked docks at Duluth and Superior.

The oversupply was due to the failure of the usual demand to materialize rather than a poor estimate of supply. The dock men expected the mines of the Mesaba Iron Range to operate full blast and consume much fuel; and the mines were idle the greater part of the summer.

Even when the strike became a reality the gravity of the situation was not appreciated. The docks were still well filled and buyers refused to be worried. Prices, however, did not fall further, and the market showed signs of strengthening.

Because of the coal on hand, Duluth became the supply center of territory as far away as Lake Michigan and even shipped coal to lower Lake ports. This was unprecedented and there began to be talk of a shortage at the Head-of-the-Lakes. A vast amount of coal also was shipped by rail to out-of-territory points.

By this time summer had come and the demand for anthracite had fallen away entirely. Bituminous, however, was moving fast enough to mystify and alarm even the most phlegmatic buyer. Prices rose with a jump. Local and territory buyers tried to make up their minds to get in on the market, and before they were ready to buy it, coal was being meted out to "steady customers" only. The only thing that staved off an industrial panic in the Northwest was that industry had been quiescent for some time.

Things continued in this strain until September, when the strike was settled and the first cargo of coal arrived. The demand for bituminous was satisfied quickly. At first there was regulation in the shipping, but the carriers brought coal to Duluth at a rate never before seen, and the docks soon filled up. It was hardly a month and a half before industries were urged to buy their coal at once to prevent a dock tie-up. This they did, with the result that dispatch of both boats and cars was excellent.

The first cargo of anthracite did not reach Duluth until more than a month after bituminous started coming. At first it was thought that enough would

arrive to satisfy the needs of the Northwest. It soon became evident, however, that this was impossible.

The real pinch in anthracite did not come until the latter part of November, with the first cold. Householders failed to buy until the last moment, expecting a drop in prices, which were fixed the same as last year. A large portion of available stocks of anthracite was held, however, for Duluth consumption, and not until the latter part of December was it utterly impossible to get hard coal.

One of the features of the shortage of anthracite is the development of the hard- and soft-coal briquet industry at Duluth. There are now two plants each producing 600 tons of briquets daily.

Approximately 3,250,000 fewer tons of bituminous coal were unloaded here than in 1921 and about 1,250,000 tons less of anthracite. Normally receipts run about 2,000,000 tons of hard coal and 8,500,000 tons of bituminous.

From all appearances the Northwest will come to the opening of navigation in 1923 with **not a free ton** of anthracite or bituminous on the docks, as in 1921.

Many Difficulties Beset Minneapolis Trade

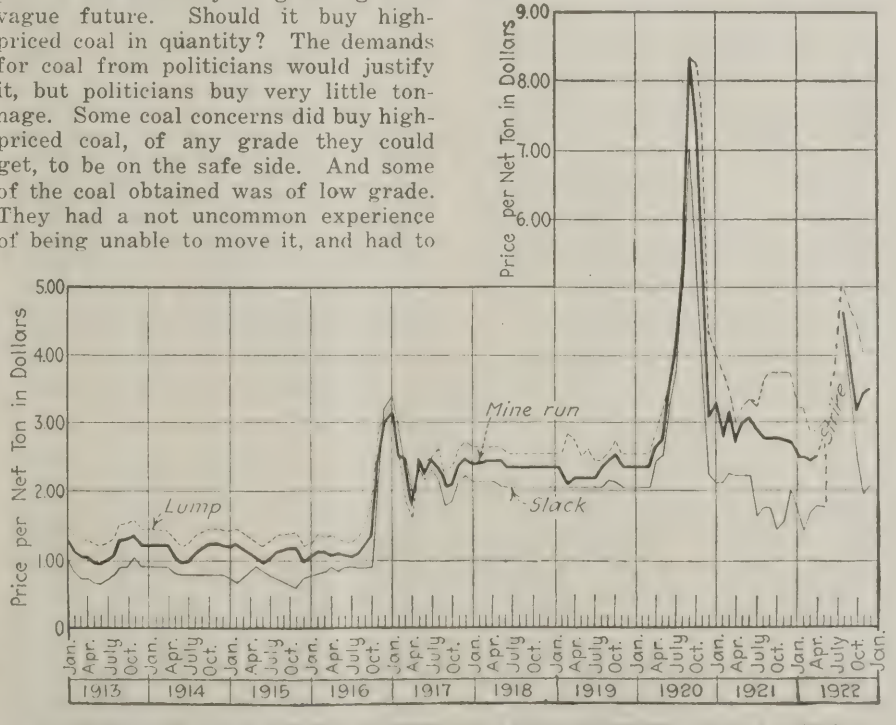
Dock Interests Forced to Buy Coal They Do Not Want and Then Take Losses When Demand Slumps—All-Rail Competitors Cut In Deeply—Substitutes for Anthracite Flood Market

By G. A. Welch

IN THE Minneapolis region the year just closed opened with a depressed and inactive sale for all grades of coal. Even when the approach of April 1 made it certain that there would be a strike and a suspension of all coal production, very little interest was aroused. Buying showed now and then a little spurt in some sections, but the tonnage placed was small. During the season of navigation, the docks on Lake Superior had been stocked to a considerably greater extent than was necessary.

The strike in both anthracite and bituminous fields seemed to be but a joke to the Northwest. Very little coal would be needed between April 1 and Sept. 1, and that was ample time for operators and miners to fight out their differences and to get back to production with costs to consumers down considerably. There seemed to be no doubt in the mind of any buyer about the reduction. The owners of the coal carried over on the docks made futile efforts to sell it during the spring. No one wanted it. It hardly could have been sold at a discount, let alone the ruling price. And the weeks slipped by with the coal completely neglected.

Finally some of the railroads operating from Chicago awoke to the fact that the coal on the docks on Lake Superior was a "good buy" and a number of sales of considerable tonnage were made. This waked some of the Northwestern roads and they came into the market. The latter had been offered the same coal earlier. A little quiet buying on behalf of public utilities also ensued. And when autumn came, with still no coal being produced, the surplus on the docks was found to be pretty well absorbed.



Then came the annual hullaballoo about the urgent need of fuel for the Northwest. The politicians worked the subject threadbare. There were consultations, conferences, surveys, demands and entreaties, commissioners, allotments, priorities and incantations. But they produced no coal. The non-union miners were doing all that they could do, but it was hardly to be expected that all other sections would subside in their demands and let the Northwest get a new supply under a fair-priced arrangement, when several million tons of coal had been ignored for months.

The coal trade of the Northwest was put to the necessity of guessing on a vague future. Should it buy high-priced coal in quantity? The demands for coal from politicians would justify it, but politicians buy very little tonnage. Some coal concerns did buy high-priced coal, of any grade they could get, to be on the safe side. And some of the coal obtained was of low grade. They had a not uncommon experience of being unable to move it, and had to take a loss. Other coal of satisfactory grade but high price had to take some loss as well.

The dock trade learned a lesson from previous years, and confined its tonnage to narrow totals, so that at the end of the season the soft coal on the docks was perhaps two-thirds of that of a year previous. Dock interests encountered a sharper competition this season than ever before. The all-rail shippers bombarded the market with surplus coal. Many producers have regular officers in this district, and so their transit coal is watched carefully enough to guard against much flooding of market. But there are other concerns which sent coal into this district and dispatched a salesman to dispose of it, without the slightest established trade to depend upon. Some heavy losses were taken as a result.

Competition by rail shippers with the dock trade has been more than keen; it has been militantly aggressive. Aided by favorable freight costs rail traders have pushed into a wider trade area than ever before, and claim that they will go farther yet.

As to hard coal, it nearly resembles the story of snakes in Ireland. The receipts have been possibly one-third of last year. There was some hard coal carried over from last spring, mainly of undesirable sizes. People have been resorting to substitutes and the need for hard coal has been cut down sharply, but the receipts are far below the allotment, which was to be about 700,000 tons. If the docks receive 400,000 tons they will do well. This will be increased by some all-rail shipments, but the tonnage will not be so great as had been expected. There is talk of shipping 300,000 tons of hard coal all-rail. This probably would leave a surplus, from the way the demand has been running.

SPOT PRICES F.O.B. MINES ON THE ST. LOUIS MARKET OF COAL FROM THE MT. OLIVE DISTRICT OF ILLINOIS

Milwaukee Docks Troubled Month by Month

Glutted Market from January to June is Followed by Wildest Speculation and Upset Trading Conditions—Quality of Pool Coal Harassing and Rail Competition Keen—Hard Coal Short

By H. Bleyer

THE year 1922 was evidently unsatisfactory to the Milwaukee coal trade. The coal business normally has a full measure of troubles, both major and minor, but when these are supplemented by strikes which seriously interfere with supply and distribution, the situation becomes nerve-racking. Car supply was poor and undependable at all times. And to cap it all, the coal man, after frenzied efforts to obtain supplies at any reasonable price, was confronted by a disinterested and dissatisfied public which stubbornly held back in the hope of obtaining lower prices.

The market was glutted with coal from January until the end of June. During the two following months coal was practically unobtainable. When mining was resumed, wild speculation at the mines made business uncertain and hazardous, especially to jobbers, because of a tendency on the part of consignees to refuse coal billed to them under a fluctuating market and to insist on lower prices.

Quality Falls Off

The Eastern bituminous coal received during and after the strike was not up to its normal standard of quality, and as a result, dock men who contracted to deliver the coal with a specified volume of thermal units, were compelled to seek releases from such obligations. The government pooling system, which was put in operation when coal began to move, made quality discrimination impossible.

Because of these complications incident to marketing Eastern coal, increased quantities of Illinois and Indiana coal have found their way to Western markets heretofore dominated by Eastern coal. Continuation of the trying experiences which Western consumers have been forced to struggle against in procuring Eastern coal eventually will result in the loss to Eastern operators of a large portion of their present Western trade.

There is seemingly an ample amount of soft coal on the docks to last until another season with reasonable receipts by rail. The stock of hard coal, however, is far from sufficient, and the railroads will have to be depended upon to keep up the supply during the remaining winter months.

Anthracite has not varied in price throughout the year. Soft coal, including Pocahontas, however, has been advanced from time to time, and is now averaging $2@$2.50, higher than at this time last year.

Following are the current prices of coal in the Milwaukee market, compared with those of last year at this time:

BITUMINOUS COAL PRICES

	Jan. 1923	Jan. 1922
Pitts. Hock. & Yough.	$10.25	$7.75
Pile-run	9.50	7.25

Carrying charge 75c. per ton.

Kentucky Has Labor Peace but Market Hubbub

Western Field's Fortunate Two-Year Contract Enabled It to Produce Tremendously—Wild Buyers Run Prices Up to $11.50—Non-Union Field Suffers for Cars—Transport Improves for 1923

By A. W. Williams

THE season of 1922 in Louisville and the Kentucky fields proved unusual in many ways; in fact it probably will be remembered by the coal trade for years to come. The year's problem was to get coal transported rather than to find a market. The great coal strike stimulated Kentucky to tremendous effort, causing less labor disturbance there than in any other state in the Union.

First—western Kentucky, in April, 1921, figuring that there would be a nationwide strike about April, 1922, used brains and made a new union contract running two years and with a no-strike clause. When the rest of the country walked out in the spring of 1922, the union in western Kentucky stuck to its agreement. Demand resulted in capacity production and it was merely a question of getting enough cars. The railroads came to bat in great shape, and tonnage records were established in western Kentucky which may hold for years. The L. & N. handled 66,415 cars in May alone as against 52,717 for the best previous month it had ever had. Little hillside mines with groups of small trucks co-operated in rapid loading of cars, and coal moved out in great quantities, some of it at high prices.

Second—Most of the eastern Kentucky field is non-union, and during the strike period proceeded to mine and ship just as much coal as the ability to obtain cars made possible. Eastern Kentucky trackage facilities always have been inadequate for heavy movement in rush times, but during the strike period a large tonnage was moved.

The strike had a marked effect on Kentucky. Tonnage increased and prices climbed slowly, due to the fact that big consumers were well stocked, domestic demand was at its lowest ebb, and buyers did not figure the strike would last. On March 29, 1922, Kentucky prices, f.o.b., mines were:

Western Kentucky

Lump	Mine-Run	Screenings
$2@$2.25	$1.75@$2	$1.60@$1.75

Eastern Kentucky

Harlan

Lump	Mine-Run	Screenings
$2.25@$2.40	$1.65@$1.70	$1.35@$1.60

Hazard

Lump	Mine-Run	Screenings
$2@$2.25	$1.50@$1.60	$1.25@$1.35

In late April prices started climbing, as Lake movement commenced and steel mills and big industries placed buyers in the field. In late April all coals were selling $2.50@$3, mine run, in all sections of the state. On May 10 the price was $3@$3.25. Operators began quoting all grades at the same price, and made very little prepared coal. Prices slowly advanced in June when news came of the threatened rail strike and in July ran at the start at around $3.50 @$4.50. They advanced rapidly in mid-July, ranging $4@$5.50 on July 12,

*Estimated

$6.50@$7.25 July 18, and on July 22, the high-water level, western Kentucky was quoting $11@$11.50 and selling it freely in Chicago, Indianapolis, St. Louis and other big consuming points. On the same date eastern Kentucky was asking $9@$10.50. That was a wild week, with prices jumping so fast that jobbers were caught short on accepted business before they could fill. Everyone was playing for quick advances and tonnage was sold day to day at time of shipment only. Buyers were buying bills of lading and nothing else.

With the blowing up of the trainmen's strike prices began to fall, but threatened rationing of cars by the Hoover conference was the chief forcer of lower prices. Between July 22 and July 26 prices dropped from $9@$11.50 a ton to $6@$7.50. Since then prices have slumped some, especially in western Kentucky, which got down to $3.50 for lump, but the market generally was much higher than in the early spring.

Kentucky operators were never able to agree with the Hoover plan of price control or any other plan, objecting principally because car supply grew so poor. Operators say their expenses have been so great that they have not made much money this year. Eastern Kentucky has had a fair year in spite of the railroad tie-ups such as paralyzed traffic through the important rail junction at Corbin.

River transportation was at the lowest ebb in history, mainly because of low water. For the first five months a total of 20,861 tons reached Louisville by water, as against 23,106 tons for the corresponding months of 1921. The 1921 total was 57,311 tons. This year the total tonnage probably will fall short of 30,000. A few small shipments of coal from the Beattyville district on the Kentucky River have come in, but the big West Virginia shipments were cut off. By use of artificial waves West Virginia tonnage got as far as Cincinnati.

The retail trade has had a mean year. In 1921 the retailers stocked their yards. A mild winter and dull industrial conditions resulted in generally poor demand and when mine prices broke badly in the winter the "snowbirds" forced retailers to lower prices and yards were unloaded at a loss in many instances. The retailers refused to stock coal at high prices, as a result of the bitter experiences of 1921.

The outlook is generally better for the coal trade than it was at this time last year. Stocks in industrial as well as domestic hands are smaller, in spite of heavy production. Buying is on a hand-to-mouth basis and consumption is larger, with the result that prospects are for a fairly steady market to spring, with the possibility of a rapid advance if the threatened strike develops. River transportation outlook is better, as there is more interest shown and facilities are improved.

Railroad conditions are improving. Big car and motive-power orders have been placed by the L. & N., C. & O., Illinois Central, Monon, N. C. & St. L., and other roads. The L. & N. is spending $52,000,000 in improvements, nearly $30,000,000 having been contracted for this year, including enlarged sidings, terminals, double tracking, etc., with a considerable amount of work done in the Harlan and Hazard fields, which regions for years have suffered for want of cars.

Production capacity has been enlarged far more rapidly than railroad capacity. The Hazard field ten years ago was just getting started, and the same thing was true of the Harlan, Elkhorn and other eastern Kentucky fields.

SPOT PRICES, F.O.B. MINES, OF BITUMINOUS COAL, FROM WESTERN KENTUCKY, BY MONTHS, 1922

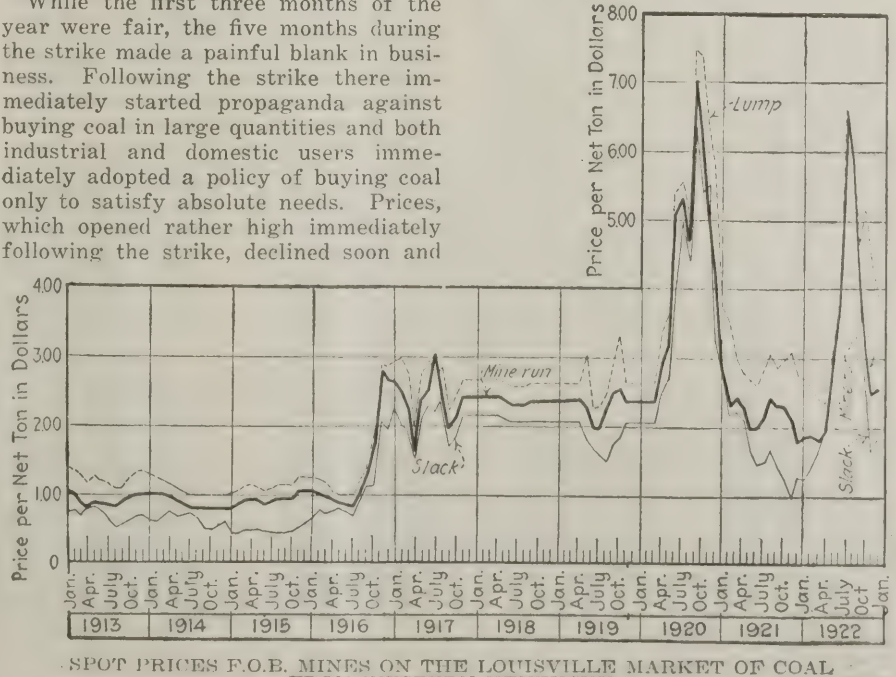
Indiana Ends Year with Sigh of Relief

Coal Men Worried, However, with Check-Off Dispute Auguring Ill—Not Much Money Made by Hoosiers in 1922—Weakening Market Runs Well into Midwinter

By Earl Bullock



IT IS with a sigh of relief that the coal producers of Indiana see the hectic period of the last twelve months fade into a new year. The majority of the trade in Indiana, however, can't see anything particularly bright for at least the first six months of 1923. At any rate, it can be no worse than the first six months of the year just closed. The end of 1922 augured ill for the future with the union heckling the operators of Indiana with threats of a strike because of their first refusal to permit the check-off of the strike assessment of $4 per capita to reimburse the strike fund of the international organization so that another strike can be staged next April.

What with declining prices, decreased consumption, a strike lasting for months, a car shortage when business picked up and no orders when cars got plentiful, little individual strikes and what not, the last ten months have been anything but a good time for the local trade.

While the first three months of the year were fair, the five months during the strike made a painful blank in business. Following the strike there immediately started propaganda against buying coal in large quantities and both industrial and domestic users immediately adopted a policy of buying coal only to satisfy absolute needs. Prices, which opened rather high immediately following the strike, declined soon and continued on a general downward trend. There have been slight periods of strength and once or twice some trifling rises in quotations, but on the whole the price level has declined so far as Indiana coal is concerned.

Some operators say the rapid spread of the central-power-plant idea is having a great deal to do with the situation. They all admit there is something wrong, especially so far as the steam-coal market is concerned, and they cannot entirely explain the slow market. Since the end of the strike the railroads have taken more steam coal than ever before, showing conclusively that goods are being moved and the manufacturer is using power of some sort. It is a well-known fact that the manufacturer has no large reserve and it also is known that between now and April, when local operators expect another strike, the manufacturers and utilities cannot build up tremendous reserves.

The local trade apparently has a large portion of praise for President Hard-

SPOT PRICES F.O.B. MINES ON THE LOUISVILLE MARKET OF COAL FROM WESTERN KENTUCKY

ing's price policy. They say that this is one development due to the strike that has worked out. There is not so much praise, however, for the fact-finding part of the presidential program. Many of the most prominent operators in the state declare the operators do not need a fact-finding commission—they know the facts, as do the miners. The need as they see it is for something that will unravel the facts into some program which will eliminate the annual recurrence in April.

In case of a strike next April the trade in Indiana looks for an immediate advance in non-union coal. It was two months last year before coal from these mines took any jump, but there were reserves at that time and there may be little or none if another strike is called.

Early Market Dullness and Later Rail Trouble Hampered High-Volatile Output

Increased Production in Logan Partly Offset by Losses in Kanawha and Coal River—Kenova-Thacker Fared Better Than Other Fields—Kentucky Mines on C. & O. Double 1921 Yield

By J. W. Weir

THE history of conditions during 1922 in the southern high-volatile area of West Virginia and in northeast Kentucky and southwest Virginia is to be divided into two periods, the first lasting from Jan. 1 until about July 1 and the second covering the remainder of the year. The first period was one of market inactivity and the second one of transportation disabilities so serious as to materially cripple the mines. As a result it is doubtful if actual production in the three high-volatile fields of southern West Virginia was much above 23,500,000 tons. That did represent, however, a marked increase in the output of the Logan district, offset in part by losses in Kanawha and Coal River.

The most serious factor at any time during the year was car shortage, not so much in evidence, however, during the first few months, owing to the poor demand existing in that period. From July until the end of the year mines at no time were afforded sufficient transportation facilities to produce more than half of capacity and during the last quarter of 1922 car supply most of the time was not equal to more than 30 per cent of allotment, particularly on the C. & O.

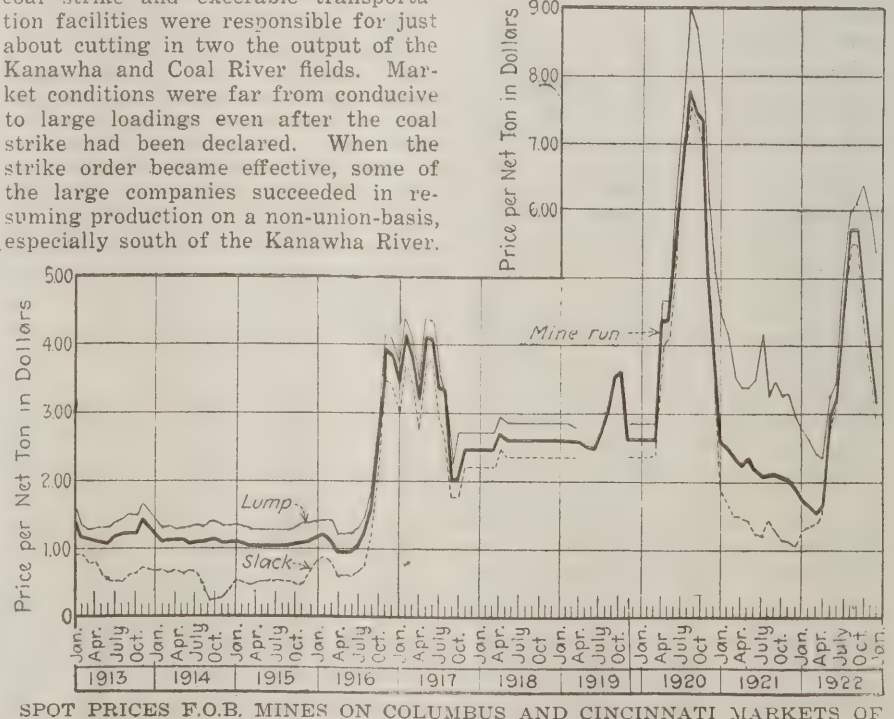
When the year began market conditions were worse than at any other time in recent years. There was no sale either for domestic or for fuel for steam purposes and mine-run was not bringing much in excess of $1.25 a ton. The coal strike had been in effect for several weeks before mines felt the stimulus and even then buying was confined to utilities, railroads and the steel mills, many consumers appearing to feel that they could obtain all the coal they wanted whenever it was needed.

It was not indeed until after the rail strike began to curtail production seriously, after the middle of July, that buyers began to be at all apprehensive. During the Lake season mines had a ready market for their output in the West but with the closing of navigation there was a slump in Western markets and for several weeks prices steadily dropped, only to be stiffened by a sudden resumption of buying in Eastern markets early in December, as a result of which mine-run reached about $3.50 a ton, with prepared grades quoted $5@$6. During the latter part of 1922 in fact $3.50 a ton seemed to be the average price for mine-run.

After producing at the rate of over 16,000,000 tons per year, the railroad shopmen's strike brought an acute car shortage, the worst ever experienced in the Logan district, and production dropped below 800,000 tons per month, as shown in the following table:

MONTHLY PRODUCTION, LOGAN DISTRICT
(In Net Tons)

January	1,065,830
February	1,178,940
March	1,330,550
April	1,277,420
May	1,603,630
June	1,641,060
July	785,430
August	764,450
September	685,140
October	697,720
November	761,320



Exceedingly poor demand during the early months of 1922, partial suspension of operations at mines during the coal strike and execrable transportation facilities were responsible for just about cutting in two the output of the Kanawha and Coal River fields. Market conditions were far from conducive to large loadings even after the coal strike had been declared. When the strike order became effective, some of the large companies succeeded in resuming production on a non-union-basis, especially south of the Kanawha River. Such companies as had operated during the strike declined to make any agreement with the union when a settlement was effected.

The Kenova-Thacker district fared somewhat better than other high-volatile regions. Most of the time production was above 100,000 tons a week, so that for the year as a whole the volume of coal mined and shipped was not far from 6,000,000 tons. For a time early in 1922 it was not possible to make heavy shipments owing to a poor market. But with a shortage in some of the Western markets after the coal and rail strikes had become effective, production was speeded up.

PRODUCTION IN SOUTHWEST VIRGINIA
(In Net Tons)

January	613,328
February	630,821
March	754,588
April	726,796
May	991,745
June	1,068,501
July	792,185
August	838,604
September	725,937
October	853,830
November	800,000
	8,796,345

There was a depressed market during the first four months of 1922, which tended to curtail production in southwest Virginia. Effective with the strike of miners and for a period of 60 days

SPOT PRICES F.O.B. MINES ON COLUMBUS AND CINCINNATI MARKETS OF COAL FROM THE KANAWHA FIELD

thereafter, production increased at a rapid rate. Beginning July 1, however, output underwent a decline, due to serious car shortage.

It is somewhat difficult to forecast what may be expected during 1923 because so many factors enter into the situation, the first of which is overdevelopment of the industry. Production is going to be restricted to the ability of the railroads to furnish cars, but it is natural to assume that there will be considerable improvement in that respect. Unless there is a marked increase in consumption, market conditions, as viewed by some Virginia operators, do not at this time look encouraging, unless there should be another miners' strike on April 1.

Approximately twice as much coal was produced by the mines on the C. & O. in Kentucky during 1922 as during the preceding year, 1922 production being between 3,500,000 and 3,700,000 tons as against 1,850,000 tons for 1921. Market conditions were much better than in 1921, except during the early months of the year. The most serious period during the whole year was the last six months, when it was not possible to produce more than 100,000 tons a week, or about 30 per cent of capacity, owing to a scarcity of cars and poor motive power. Even when the demand in other sections waned late in the year and when prices in other fields dropped northeast Kentucky producers had no difficulty in finding buyers for mine-run at $3.50 @$4, with lump and block stable at $6@$7. Lake shipments, were unusually large.

Conditions in Northern West Virginia in 1922 Underwent Slight Change

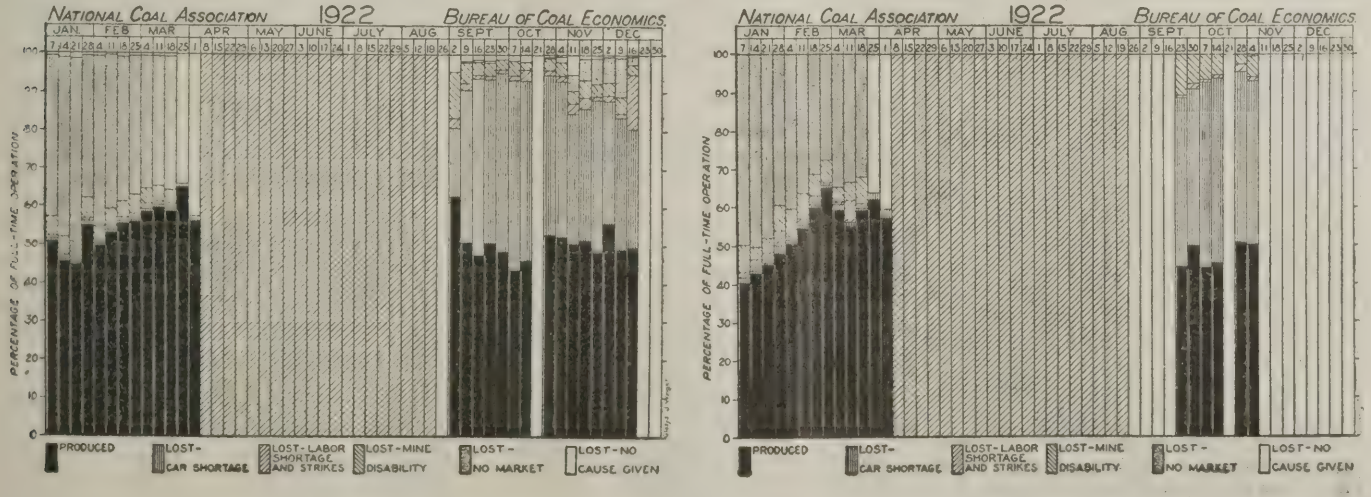
Good Feeling Between Miners and Operators Evident During Strike—3,500,000 Tons Production Loss from Car Shortage —Failures Are Few — Future Shrouded in Uncertainty

H. A. WILLIAMSON
Fairmont, W. Va.

IN A general way conditions in 1922 have not been greatly different from those of 1921. In 1921 we shipped, roughly, 14,500,000 tons; in 1922 we will ship probably 12,500,000 tons. Naturally the feature most affecting tonnage was the strike.

During the strike of 1922 the outstanding feature in northern West Virginia was the evident good feeling existing between the operators and the miners. It is almost universally conceded that there would have been either no strike at all or one of short duration had those concerned been allowed to negotiate without the interference of outside parties. There were a few disturbances but they were small in comparison to the area involved and what happened in other regions.

In the long run what affects the tonnage most is the car supply or lack of it. There can be no satisfactory solution of this situation until the basic feature is corrected. That feature is simply that the railroads do not have sufficient cars. Various figures have been given as to what loss lack of cars caused in 1922, but it is conservative to say that it was at least 3,500,000 tons.



Up to a few years ago the B. & O. was the only road serving the region. Then the Monongahela, having connections with the Pennsylvania and New York Central systems, opened, and also the Western Maryland obtained certain short branches and connections and commenced to send its cars into the region. In 1920 the Monongahela handled something over 5,000,000 tons, in 1921 about 3,600,000 and in 1922 (ten months) slightly over 3,000,000 tons. It is to be noted from this that tonnage on the Monongahela dropped in spite of the fact that all the mines on its lines are practically new and just developing and their tonnage should be increasing largely each year. Of course some of this has been due to lack of business and a large part in 1922 due to strike, but it is also largely due to lack of railroad cars. Further, the car supply has been generally better on the Monongahela than on the B. & O.

Another feature severely affecting tonnage to the West and Lakes is the freight differential which went into operation some years ago. During the period of severe shortage of coal—when "coal was coal and price made little difference"—the affect of this differential was not noticed. Including the Lake coal, in 1914 5,500,000 tons of coal went westward; in 1916 3,000,000 tons. In 1921 our Western shipments, including Lake coal, were 1,330,000 tons and for the ten months of 1922 919,000 —a differential of 40c. per ton went into effect in 1920. The figures are more impressive than any comment we can make. Had the region been able to compete in the Western markets it would have shipped more coal in that direction and their present shortage would not now be as acute as it is.

In spite of the disadvantages of the year there have been but few failures of mining firms. This storm of adversity all in a bunch has been weathered very well. There have been some new companies organized and some development work has been done, but not a great deal.

Prices have varied widely during the year. Accurate average prices, in spite of the many such reported, are difficult if not impossible. In a general way probably $1.60 per ton, f.o.b. mines, represents the low price of the first one or two months of the year. Later in the year spot prices at $6.50 and higher have been rumored. Authentically reported maximum prices are in the neighborhood of $4. The average price for the first ten months of the year appears to be approximately $3.50.

What will happen in the coal business in 1923 is a question probably more in doubt than ever before in the history of the industry. From the fact that there

Illinois Indiana

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

apparently is a coal shortage and other business is picking up, the demand for coal should be strong. On the other hand there is no probability of betterment of the railroad situation and there is the possibility of a strike. Northern West Virginia operators seem to be preparing for a good year but they also seem to have no particular reason for it other than a general spirit of optimism.

West Virginia Smokeless Output Hits High

Last Year One of the Best Since 1916—Estimated That 33,000,000 Tons Was Produced, Which Could Have Been Surpassed with Adequate Transportation

By J. W. Weir
Elkins, W. Va.

THE year 1922 ranks as one of the largest in smokeless production in West Virginia since 1916. It is conservatively estimated that when all statistics are compiled it will be found that not less than 33,000,000 tons was produced. The smokeless mines could have exceeded the record of 1916 if transportation facilities had been adequate. Only at the outset of 1922 and then for but a short time was production retarded by lack of demand.

During the first part of the year there was a recovery from the market slump witnessed at the end of 1921. This was followed by another period during which production reached a larger scale at times than had ever before been recorded in the history of the regions, continuing until July, when the effects of the shopmen's strike began to be felt. From then until the end of the year most mines labored under great difficulties owing to transportation disabilities.

An analysis of conditions prevailing in the smokeless area throughout the yearly period shows that the most serious factor in curtailing production was not the coal strike, not the level of prices or the state of demand but a general breakdown in transportation facilities following the termination of the railroad strike. Of course during the early part of the year, when there was a comparatively light demand for smokeless, car service was ample for all requirements. And even during the height of the coal strike transportation facilities were conducive to a large production and a large movement of coal. Though of course the shopmen's strike began to make itself felt in retarding the movement of coal after it had been in effect for a few weeks, as had been expected by the officials of the United Mine Workers, it has been in the months since then that the smokeless mines of southern West Virginia have suffered the most.

Much of the time during the last five months of the year car supply was not much better than 30 per cent, the N. & O. toward the close of the year making it possible, however, to load as much as 40 per cent of capacity. On other lines the car supply was restricted to about 30 per cent of allotments; some of the mines on the C. & O. were unable to secure more than a 20 per cent supply. It was not only a paucity of cars which tended to so materially curtail production but deficient motive power.

TABLE OF PRODUCTION ON THE N. & W. BY DISTRICTS, FOR THE YEAR 1922

Pocahontas	16,000,000
Tug River	4,500,000
Williamson	6,500,000
Clinch Valley	2,200,000
	29,200,000

The difficulty during the latter part of 1922 was in hauling coal to Western markets. Western outlets were constantly congested, necessitating frequent embargoes. Still another factor in retarding Western movement was failure of connecting roads to return cars which had been used to transport coal to the Lakes and Inland West markets.

There appeared to be less fluctuation in prices during the year than is usually witnessed. At the outset the demand was extremely dormant and that of course exerted a depressing effect on prices, mine run reaching as low a level as $2 a ton during the early months of the year. The prospects of a strike in organized fields on April 1 stiffened the demand for smokeless to some extent and resulted in heavier orders being placed for quick delivery yet there was not as sharp an advance as might have been expected in view of a prospective shortage of fuel in the markets. Prices were far from being as high, however, as had been the case during the 1919 strike, not only because of an agreement with Secretary Hoover but also because producers were averse to seeing a runaway market and in so far as it was possible checked the upward tendency as much as possible. As a matter of fact during the period of the coal strike smokeless prices were not on as high a level as they were during the final months of the year, when they took a decided brace as a result of heavier Eastern buying.

PRODUCTION ON THE VIRGINIAN, FIRST ELEVEN MONTHS IN 1922 AND 1921

	1922	1921
January	506,291	603,950
February	572,237	368,123
March	706,983	386,977
April	528,471	510,237
May	690,033	732,102
June	719,702	696,428
July	512,362	512,806
August	503,222	477,909
September	494,445	412,391
October	617,533	558,863
November (*a*)	581,593	483,855
	6,432,872	5,743,641

(*a*) Estimated.

Just about the time Lake shipments ceased, when it was thought there might be a surplus of low-volatile coal available, Tidewater markets revived and then there was during the last six months of the year a period of heavier buying in Inland East markets as smokeless supplanted anthracite to some extent.

The strike of bituminous-coal miners was felt in none of the smokeless fields of West Virginia except one—the New River region—though for a time it looked as if the United Mine Workers might succeed in organizing the Winding Gulf field. Injunctions, however, operated to put a stop to the effort.

OUTPUT OF COMMERCIAL AND FUEL COAL FROM MINES ON THE N. & W., FIRST TEN MONTHS OF 1922 AND 1921

	1922	1921
January	2,016,276	2,351,279
February	2,299,439	1,621,700
March	2,658,616	1,685,542
April	2,726,744	1,668,589
May	3,332,826	1,803,260
June	3,422,879	2,061,422
July	2,256,136	1,934,368
August	2,634,179	1,838,277
September	2,392,892	1,752,960
October	2,098,252	1,967,153
	25,838,239	18,684,550

Production was increased to such a marked extent during the strike at mines in the smokeless area that such mines had an important part in making it possible to produce fully as much coal, so long as transportation facilities were afforded, as had been possible previous to the strike with all mines in operation. The only effect of the walkout of union miners in southern West Virginia was to increase the non-union territory in that part of the state and to put the New River field in the non-union category, at the same time resulting in the abandonment of District 29.

COAL AND COKE LOADING BY MONTHS, 1921 AND 1922 BY MINES ON THE C. & O.

Month	1921 Coal	1921 Coke	1921 Total	1922 Coal	1922 Coke	1922 Total

November	2,010,940	23,880	2,034,820	1,938,150	46,980	1,985,130
December	1,566,850	20,460	1,587,310	.....	.....	.....
Totals	23,623,900	319,890	23,943,790	23,807,570	403,910	24,211,480

Tracing developments during the course of the year, January was ushered in with low prices prevailing, even the prepared grades selling at as low a figure as $2.65 and with mine-run priced at less than $2 a ton—a figure so low that many operators ceased production of such a grade for a time. Market conditions made for general idleness among the mines and for small production. By the middle of February fear of a strike had begun to stimulate buying so that it was possible to produce at 60 per cent of capacity. The demand was principally for prepared grades, however, with egg and lump bringing $3.50@$4.25.

Even in March, although there was a fairly well sustained market, there was no rush, the opinion apparently prevailing that the non-union fields would be able to supply all the fuel needed. Car shortage began to make itself felt slightly, but not on the N. & W. Production was smaller during the latter part of March, on the eve of a coal strike than during the earlier part of that month.

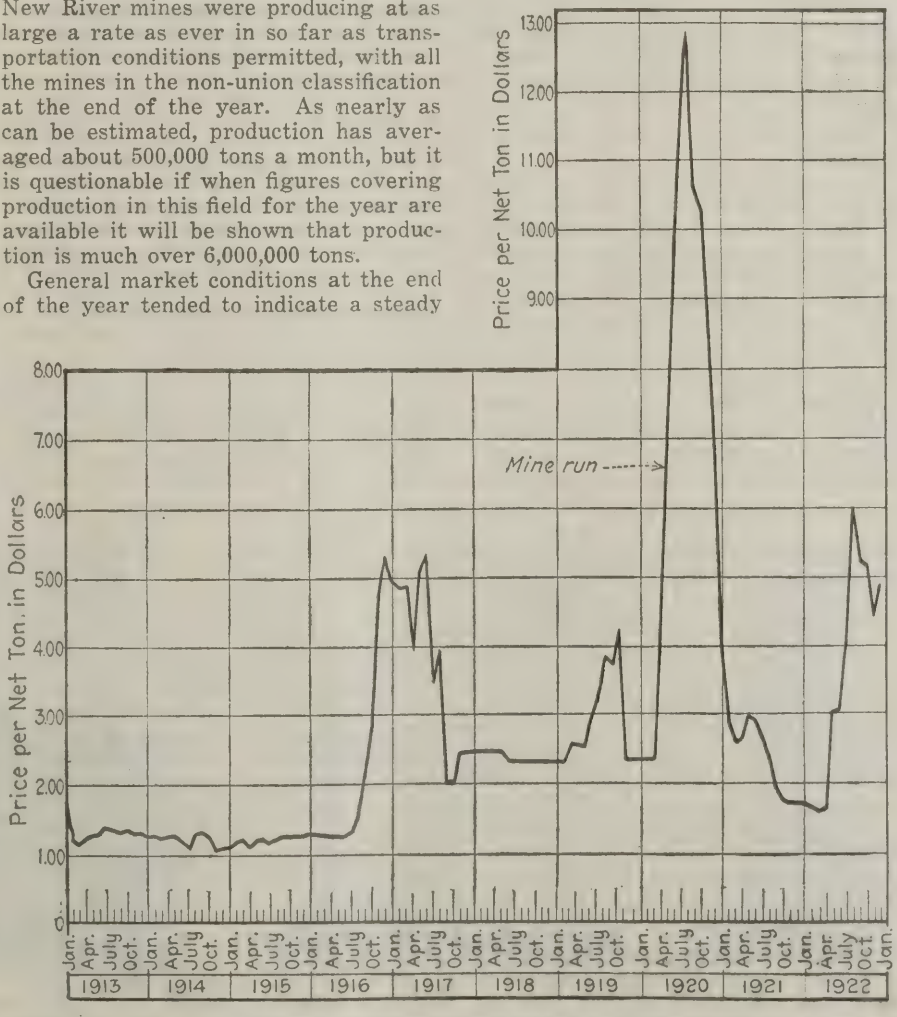
Even with a strike in effect smokeless buyers continued to bide their time. There was inquiry for a little more steam coal perhaps, but the market was still decidely apathetic and prices were unchanged. During the latter part of April inquiries began to become more plentiful, but even at the outset of May lump was not bringing much more than $3 and mine-run about $2.25.

May was a month of increasing production and falling prices, the N. & W. handling more coal than in any other month during the year except one, with production also on a large scale on the line of the C. & O. and the Virginian. Prices slumped to a marked degree, however, during the latter part of May, pending the outcome of the fair-price conference at Washington.

Production reached the maximum for the year in smokeless territory during June, with every mine working to increase its capacity under the urging of government agencies. It was not until the early part of July, however, that prices showed much signs of advancing, mine-run during the early part of that month ranging $3.25@$3.50, with lump commanding $3.50@$3.75. During the early part of July railroads suffered no ill effects from the rail strike but by the latter part of that period congestion had become somewhat general and production was materially curtailed. Inquiries began to grow in volume. Mine-run was commanding about $3.50 and lump was priced at $5@$6.

There were further declines in production in August. Priority orders began to divert smokeless from its normal channels and that tended not only to create confusion at the point of production but also to create a shortage in markets to which smokeless usually was consigned.

Prices underwent a decline during October owing to the large tonnage in Eastern markets, it being impossible to transport a particularly large volume to Western markets because the proper kind of equipment was not to be had. There was more activity in the buying of high-volatile in fact in October than in low volatile and in general smokeless mine-run did not range much above $3.50@$3.75, with prepared grades quoted $4.75@$5.



Until the latter part of November there was no change in market conditions. The demand was much better in the West than in the East and tidewater buying was almost at a standstill. The shortage of cars and poor transportation facilities continued throughout the greater part of December, though at times the N. & W. was able to increase the supply. On the C. & O., however, transportation conditions went from bad to worse and many mines had a supply of empties available only about once every ten days. The market veered early in the month, with buying of low-volatile principally in the East. The price on mine-run ascended the scale to $5 and finally to $6, with prepared grades $6@$8 and even more.

Commencing early in the year, operations were continued on a non-union basis in the New River field up until April 1, when the union succeeded in inducing many miners to cease work. The strike was short-lived, however, as many of the miners returned to work before it was a week old and it was possible to operate fully half the mines in the region. Steady gains in tonnage were made thereafter, and when the coal strike officially came to an end New River mines were producing at as large a rate as ever in so far as transportation conditions permitted, with all the mines in the non-union classification at the end of the year. As nearly as can be estimated, production has averaged about 500,000 tons a month, but it is questionable if when figures covering production in this field for the year are available it will be shown that production is much over 6,000,000 tons.

General market conditions at the end of the year tended to indicate a steady demand particularly in Eastern markets, through the shortage of anthracite, so that some producers at least thought that activity in the smokeless market might be expected during the first quarter of 1923.

Winding Gulf mines, of course, were handicapped during the early part of 1923 by a poor market, so that production was not on a large scale. For a time at the outset of the coal strike it seemed possible that a sudden and unexpected invasion of this region by the forces of the United Mine Workers might transform the region into a union district. The injunction issued by Judge McClintic, however, put a stop to organization work and throughout the period of the strike, mines continued to operate regularly, producing a large tonnage. Production will run well over 6,200,000 tons for the year. Those who have made a study of what may be expected during 1923, after taking into consideration the low price of coal during the first four months of the year and the weaker prices prevailing a part of the time during the last four months of the year, the increase in wages and loss of time, entertain the opinion that market conditions will not be above normal at least during the early part of the current year.

It is only necessary to point to a total of 25,000,000 tons of coal handled by the N. & W. during the first ten

SPOT PRICES F.O.B. MINES ON BOSTON MARKET OF MINE-RUN COAL FROM SMOKELESS FIELDS OF WEST VIRGINIA

months of the year to indicate in a measure the large production of the Pocahontas and Tug River fields. There were times in fact when Pocahontas production reached a total of 400,000 tons a week. Only a comparatively small proportion of the tonnage originating in Pocahontas territory found its way westward, owing to the lack of the right kind of equipment. Producers generally are not sanguine of any marked improvement in transportation conditions during the winter months and are therefore inclined to believe that smokeless will be scarce. If that is the case then there will be a steady demand at all times, at least until the beginning of April, when the labor situation, nationally, may become a further factor.

The figures herewith are not exact but are approximately correct and show that production in the Pocahontas field increased 25 per cent over that for the year 1921, bringing the total up to the figure for 1916, the banner year of the Pocahontas field. Southern West Virginia in the whole had a good year.

Colorado Busy and Fairly Peaceful in 1922

Practically Entire State Except Canon City Worked Non-Union, Supplying Widespread Market—Rangers, Now Disintegrating Because of Politics, Kept Order—Car Shortage Was a Handicap

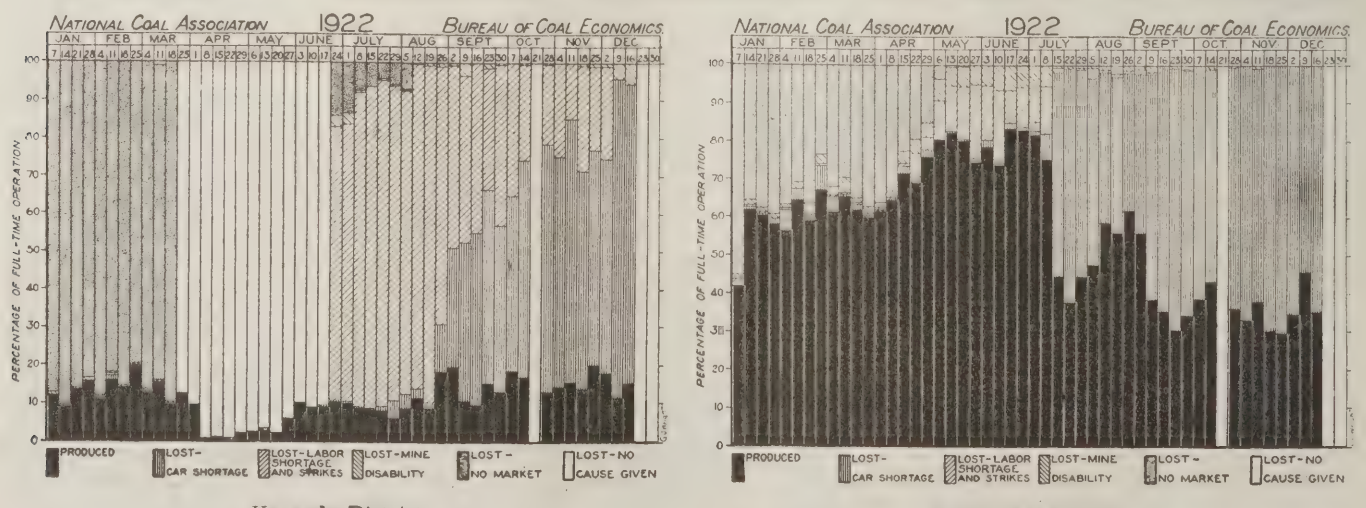
By Fred L. Cunningham
Denver, Colo.

ALTHOUGH Colorado's coal business was considerably hampered during the year with car shortage, strike troubles, mild weather and tunnel blockades, operators declare the year 1922 was one of the most progressive in the history of the state. The strike in the spring was adequately handled by Governor Oliver H. Shoup and his Colorado Rangers. During these critical times the cost of the guard duty was less by far than any previous strikes in the Colorado mining districts. Although it is generally known that Governor-elect Sweet opposes a Ranger force, it is doubtful whether the present ranger law can be repealed, as there is a Republican majority in the state Legislature.

The passage of the Moffat tunnel measure last spring at a special session of the Legislature, with all opposition blocked by the Colorado Supreme Court, will mean the opening of one of the greatest coal fields in the world. Routt and Moffat Counties in Colorado and the Uintah Valley in Utah will be directly benefited by this tunnel when it is built. Many rich mines already have been developed in these regions, but they lack transportation facilities to get their production to a market.

Freight rates that are inequitable have long troubled Colorado and New Mexico. Operators in 1922 appealed to the Interstate Commerce Commission for an adjustment. While a series of hearings were held on one of the cases throughout the West and the Southwest last spring, no decisions have been made. At the present time coal can be shipped from Wyoming into Kansas, Nebraska and other states at a lower figure than from mines in Colorado. Since the railroad strike, little has been said of freight rates, as most of the operators have had difficulty in getting a supply of cars.

The year started out more or less hopefully. The last half of January saw production stimulated greatly by the cold weather, the third week totaling 200,000 tons compared to 260,000 tons for the corresponding week in 1921. Though labor troubles were expected, no disturbances were reported when the reduced wages known as the C. F. & I. scale were put into effect in the bituminous mines of Routt County.



During the first part of March 500 Weld County miners went on strike and this resulted in the closing of eight mines in the lignite district. The miners refused to accept a 30 per cent wage cut similar to that in the bituminous fields. Bituminous lump was $5, slack $2.50 and steam $2 at the mines.

Late in March the worst accident of the year happened. Seventeen miners were killed in Sopris mine No. 2 of the Colorado Fuel & Iron Co., near Trinidad. Two hundred miners had left the mine just before the explosion. The only other great accident was the killing of six men in the Satanic mine of the Colorado collieries at Morrison in January.

With the strike called April 1, operators complained only of lack of business asserting that production was 90 per cent. Colorado was doing the unusual thing of shipping coal into Wyoming, which was almost completely handicapped by the strike. Bituminous lump was selling at $5@$6 at the mine, while lignite brought $4. Weld County lignite sold at $3.50, retailing for $6.20@$7.

During the summer the market grew so slack that many mines shut down for lack of market. Canon City district was the only one in the state closed by the strike. Efforts were made in various fields to cause trouble for miners willing to work. The Rangers quieted several incipient difficulties. The latter part of August Robert Turner, superintendent of the Turner mine, in Huerfano County, was arrested by State Rangers when miners reported that they had gone to the mine to work and that Turner informed them it would not be safe, it is alleged, unless they had a guard of at least 15 Rangers. He was released on bond. This peculiar case has since been dropped.

During September and since, the shortage of cars has been of serious concern to most of the coal operators. Price increases at the mines ranged from $1 to $1.50 per ton. In October the labor situation was somewhat improved with the readjustment of the wage scale. Retail prices were 75c. lower than in 1921. A price war in Weld County was waged between two small coal companies, reducing lignite coal in northern Colorado 90c.@$1.50 per ton. Some operators declared they were selling coal at $2.25@$3.

Kanawha District Pocahontas District

PERCENTAGE OF FULL-TIME OPERATION OF COAL MINES AND TIME LOST BY CAUSES

In spite of the car shortage, production in Colorado from Jan. to Sept. 30, 1922, was 6,916,131 tons, an increase of 307,105 tons over the same period in 1921. The big companies consider they have been successful generally speaking, in their battle against the unions and look forward to the twelve months of 1923 with some satisfaction though the weakening of the Rangers may permit more labor trouble in case of a nationwide union mine strike.

Oil Cuts Deeply Into Coal Trade of Southwest

Exceeds All Previous Annual Inroads, Taking Market for 692,000 Tons of Coal in Kansas City Alone—Helps to Cause Buyers' Strikes—Coal Dealer Tactics Aid Oil—Production Short

By C. F. Butcher
Kansas City, Mo.

NO ONE thing, other than the strike, caused coal men of the Southwest more annoyance in 1922 than the increased use of oil. It is estimated that it is now displacing more than 692,800 tons of coal a year in Kansas City. Estimates based on a knowledge of the number of tanks in use there show that oil is now doing work formerly done by some 540,600 tons of industrial and some 152,200 tons of domestic coal.

On May 1, 1922, there were 9,220 oil burners in Kansas City domestic heating plants. Since then the total has been increased to 15,220. Calculated on a basis of ten tons of coal to a customer, these 15,220 tanks have supplanted grates which provided a market for 152,200 tons of coal a year. At the same time many oil burners have been placed in tributary territory. One firm in the last seven months sent 600 tanks into that territory.

The increase is attributed primarily to fear by consumers of a coal famine, aggravated by reports of car shortage and by geographical confusion on the part of newspaper readers, many of whom failed to distinguish between reported conditions in the hard-coal fields of the East and the soft-coal fields of the Southwest. Oil was partly responsible for the "buyers' strike" which was a major irritant to the coal trade late in 1922.

It must be admitted, also, that the tactics of some dealers in skyrocketing coal prices contributed to smooth the path of the oil-burner salesman. Where Kansas coal had been retailing at $8.50 @$9 a ton in January, February and March, inferior grades, stuff for which there had been absolutely no market before, was sold for as much as $18 in the summer. Coal from non-union mines in Alabama, West Virginia, Kentucky, Tennessee and Colorado was shipped in to augment such coal as was produced in non-union mines of Kansas, Oklahoma, Missouri and Arkansas, and all was sold indiscriminately at one price—the highest obtainable, regardless of its mine cost. As a result, the public was suspicious after the mines reopened when Kansas coal was quoted $1 higher than last March. Consumers placed orders for only one or two tons, and dealers, in their turn, shaved their orders to the skin.

For a time operators, handicapped by a curtailed car supply, welcomed the situation. But as the small orders were filled, "no-bill" cars began to accumulate. In September, October and until Nov. 22, Kansas coal was quoted at the mines at $6 for lump, $5.50 for nut and $2.50 for screenings. On Nov. 22, however, a return to the prices which prevailed in January, February and March was announced. Spot quotations became $5 for lump, $4.50 for nut and $2.50 for screenings.

After a couple of weeks of hesitation the demand slowly began to increase; the number of "no bills" dropped, and the business again began to suffer a little from weakened transportation. Cars again became scarce and power to haul them was scarcer. Coal men in Kansas City insist that if cars were moved at normal speed in transit, there would be little or no shortage in this district.

Southwest production in 1922 was considerably under that of 1921, which was no bonanza year. Tabulations of the Southwest Interstate Coal Operators' Association, the members of which produce between 85 and 90 per cent of the coal mined in Kansas, Missouri, Arkansas and Oklahoma, show that even after the five idle months September, 1922 fell 46,886 tons short of September, 1921. Association figures up to October show these results:

1921				
Jan.	Feb.	March	Sept.	Oct.
937,466	739,091	710,387	816,385	670,000
1922				
Jan.	Feb.	March	Sept.	Oct.
706,142	792,290	1,077,101	767,499	675,831*

*Estimated.

Volume of Business in Toronto Coal Market Much Lower Than for Many Years

Protracted Strike Has Far-Reaching Effect—Delay in Purchasing in Early Months, When Coal Was to Be Had, a Depressing Factor—Government Supervises Fuel Supply

By Philip Thompson

THE coal trade during 1922 suffered severely from the effects of the protracted strike, owing to which the volume of business was considerably less than for many previous years. The extent of the falling off is indicated by the figures furnished by the Canadian Bureau of Statistics of the imports of coal from the United States into the Port of Toronto for the ten months of the year ended Oct. 31, as follows: Anthracite, 448,915 net tons; bituminous coal, 936,750 tons, as compared with 898,616 tons of anthracite and 1,096,052 tons of bituminous for the corresponding period of 1921.

The strike was not the only factor of the situation resulting in decreased trade, as during the earlier months of the year coal was easily procurable in larger quantities had orders been forthcoming. The general impression prevailed both among dealers and the public that prices were likely to be considerably reduced later in the season. Orders consequently were on a much more limited scale than usual. Later in the season domestic buyers who had postponed their purchases were able to obtain anthracite only in small quantities.

In August, when the effects of the strike began to be seriously felt, the situation received attention from the government and municipal authorities. The federal government appointed a central advisory fuel committee to have general supervision over the supply of fuel and the provincial government appointed a fuel controller for Ontario. The public was urged to use the greatest possible economy in the use of anthracite and to employ substitutes as far as possible.

Fuel Controller Ellis issued orders limiting the amount of anthracite to be delivered to a consumer to one ton and fixing the price at $15.50. This regulation has generally been obeyed by the larger dealers who obtain their supplies from the line companies, but others who procure coal from independent companies or through brokers are accused of asking considerably higher figures. The city procured some Welsh anthracite which was distributed in small lots in emergency cases. Representatives of British coal firms have been endeavoring to obtain a permanent foothold in the market, but so far have met with little encouragement.

The supply of bituminous coal has been equal to the demand, which has throughout the year been light owing to depression in the coal-using industries. Prices, however, have been variable lately and consumers all along have been indisposed to buy except for immediate needs. The general improvement in business conditions and some

increase of activity in manufacturing indicate increased consumption in the near future.

Expectations of a more plentiful supply of anthracite toward the close of the year were not realized owing to the acute shortage in the United States and it was found necessary to adopt a rule that orders must include 25 per cent of bituminous coal. It was expected that later in the winter the proportion of soft coal to go with each order would be increased. On Dec. 18 the City Council appointed D. Chisholm civic fuel controller, requesting the provincial government to give him full power to control prices and regulate distribution.

Central Pennsylvania Had Most Eventful Year

Rush to Fill Orders Before Suspension—Record Production When Mining Was Resumed, Followed by Widespread Depression Due to Car Shortage and Lack of Water

BY D. E. SELL

THE year 1922 will go down in history in the central Pennsylvania field as the most eventful since mining on a large scale was started. The year may be divided into four periods. The first was the rush to supply orders prior to the strike. Then came the long period of anxiety and low output during the strike, followed by a record production at its end, in turn followed by a depression in practically all quarters due to a car shortage and in some places a lack of water to operate the mines.

With the resumption of much industry throughout the country and the heavy demands for transportation fuel and with talk of a strike over wage and union disputes, the year started off with heavy production, which gained momentum, reaching the peak in March, during which time considerable coal was stored.

With the declaration of a general strike, only the non-union portions of the district continued to produce, and even these mines were somewhat affected owing in some places to the non-union miners, being afraid of violence, refusing to enter the mines.

Windber, in Somerset County, and Vintondale, in Cambria County, were the principal non-union centers, and the mines in both sections, as well as in the vicinity of the main line of the Pennsylvania near South Fork, operated to 60 to 70 per cent of capacity during the strike period.

Very little attempt was made during the strike period to operate outside the non-union districts but operators took advantage of the time to get ready for the rush for coal that was bound to come, owing to the exhausted supplies.

So eager were the men to return to work and the operators to resume business that no time was lost in getting the mines under way after the strike. Production increased by leaps and bounds so that the coal-carrying roads entering the field, namely the Pennsylvania, Baltimore & Ohio, New York Central and the Buffalo, Rochester & Pittsburgh, were crowded beyond their capacity.

During the high production period, operators were hampered by a car shortage, due largely to a strike of shopmen, which reduced the number of cars available for loading and the number of engines available for hauling. This did not affect the business in this district to the same extent as some other fields due to the fact that the Pennsy shops in Altoona were kept working with a full force.

At the height of production the demand for anthracite removed many cars from the district and the government undertook the assignment of cars. This worked out all right for the mines furnishing railroad fuel, but operators furnishing commercial coal found themselves short.

The worst drought in the history of the district extended into the winter. Some of the larger mines found themselves without water and were compelled to close down indefinitely and the end of the year found most of the mines in the district, except such as own their own cars and those supplying the railroads, without cars and unable to accept orders owing to inability to guarantee shipments.

An advance step was made in organization when the Cenera1 Coal Association, the Central Pennsylvania Coal Producers' Association and the Association of Bituminous Coal Operators of Central Pennsylvania united at a joint conference held in Altoona on Nov. 9. The general office is located in Altoona.

The mines were in operation 130 days during the year. There are in the field 1,015 mines, including many smaller operations. In these mines a total of 65,000 miners are employed, of which approximately 1,000 were still on strike at the close of the year.

Production in 1922 was 34,700,000 tons, 8.54 per cent of the entire country's production. This is the lowest output since 1904, when 32,748,000 net tons were mined. In 1920 the central Pennsylvania field produced 10.32 per cent of the entire country's coal and in 1919 the production reached 14.94 per cent of the entire production.

The close of the year was met with a very serious obstacle in the form of a car shortage, which grew more acute as time advanced. With the car shortage came cancellation of orders and the operators unable to accept orders due to the fact that they could not guarantee shipment.

Utah Operators Had Lively Year in 1922

Coal Camps Under Martial Law During Strike — Grand Jury Investigation Resulted in Indictments of Several Corporations — Production Exceeded That of Previous Year

BY FRED L. W. BENNETT

UTAH coal operators had a rather lively time last year. First came the strike and the placing of the coal camps under martial law for months. As soon as the soldiers were finally withdrawn a bitter newspaper attack was launched charging that the raising of the retail price of coal to $10 was robbery. The retail price on April 1 was $9.50 for lump and a cut in miners' wages caused a 50c. reduction which held good till the figure was raised to $10 at the end of the summer. A grand jury called to investigate the industry, returned an indictment against several corporations and individuals, the result of which is still to be decided by the courts.

The first six months of the year were characterized by poor market, the weather up to April 1 having been unseasonable. Then followed a period of great activity. Producers got behind on their orders. All this was the result of shortage in other states and the alarm which many local citizens were feeling at the prolonging of the strike.

The car situation was acute during the early part of the last quarter and resulted in considerable loss. Toward the close of the year business was rather quiet compared with capacity. Production for the first eleven months of the year was 4,373,470 tons, and another half million, at least, is expected to be added for December. In 1921 the figure was 4,090,397.

The outlook for business this year is improving as a result of increasing industrial activities.

Production of Bituminous Coal By Months, 1920-1922

(Net Tons)

	1922a	1921	1920
January	37,604,000	41,148,000	49,748,000
February	40,980,000	31,524,000	41,055,000
March	50,167,000	31,054,000	47,850,000
April	15,777,000	28,154,000	38,764,000
May	20,287,000	34,057,000	39,841,000
June	22,328,000	34,635,000	46,095,000
July	17,003,000	31,047,000	45,988,000
August	27,358,000	35,291,000	49,974,000
September	39,510,000	35,870,000	50,241,000
October	45,141,000	44,687,000	53,278,000
November	45,303,000	36,805,000	52,576,000
December	46,254,000	31,650,000	53,257,000
Totals	407,712,000	415,922,000	568,667,000

(a) Subject to revision.

What Happened in the Coal Industry in 1922

January

Jan. 1—First break in union in Panhandle region occurs Dec. 30 when 200 men resume work in Colliers plant of West Virginia-Pittsburgh Coal Co. at 20 per cent reduction in wages (Vol. 21, No. 2, p. 61).

Jan. 1—Nova Scotia supreme court enjoins coal companies from making proposed 33⅓ per cent wage cut while board of conciliation tries its hand (Vol. 21, No. 2, p. 61).

Jan. 1—Permanent arbitration board rules that wages be reduced 20 per cent in Tennessee-Southeastern Kentucky field effective Dec. 1 (Vol. 21, No. 2, p. 60).

Jan. 2—Southern Ohio, Eastern Ohio and Pittsburgh operators decline Lewis' invitation to meet union heads in Pittsburgh Jan. 6 to renew four-state wage negotiations for April 1 agreement. Illinois and Indiana say they will meet but do not promise to negotiate (Vol. 21, No. 1, p. 21).

Jan. 3—Union locals in anthracite region draw up many resolutions for higher pay and stricter working conditions to be presented at Shamokin convention Jan. 17 (Vol. 21, No. 1, p. 21).

Jan. 4—Various union demonstrations against non-union mines and mines thought to be ready to open at low-pay ore made in Monongalia county. Fourteen men indicted (Vol. 21, No. 4, p. 175).

Jan. 4—President Lewis of U. M. W. of A. calls off Pittsburgh conference after Ohio and Pennsylvania decline to attend (Vol. 21, No. 2, p. 60).

Jan. 10—A few Georges Creek region mines are resuming operations at lowered wage scale. Manor Coal Co. cuts 30 per cent (Vol. 21, No. 2, p. 59).

Jan. 10—Matthew Addy interests and 120 other credit members of bankrupt Tidewater Coal Exchange sue debit members for settlement of accounts (Vol. 21, No. 2, p. 59).

Jan. 10—Keeney, Mooney and Blizzard charged with instigating Mingo county "invasion" remanded to jail without bond (Vol. 21, No. 2, p. 59).

Jan. 10—Maryland special commission submits to operators and miners for approval, a revision of state coal mining laws (Vol. 21, No. 2, p. 59).

Jan. 10—Coronado case ordered reheard Feb. 27 by Supreme Court so Chief Justice Taft can listen to argument. Bench divided 4 and 4 on it before Chief Justice White died (Vol. 21, No. 2, p. 60).

Jan. 12—Operators and miners in Georges Creek and Upper Potomac fields fail, in 3-day session, to reach agreement on next wage contract. About one-fifth of the territory is working at reduced wages (Vol. 21, No. 4, p. 176).

Jan. 13—Three entombed, many injured when 20 acres of Glen Alden Coal Co.'s National mine caves in (Vol. 21, No. 3, p. 147).

Jan. 13—Keeney, Mooney, Blizzard and 300 other union men indicted for West Virginia war. Two troopers shot trying to arrest a miner (Vol. 21, No. 3, p. 147).

Jan. 13—Government through Secretaries Hoover and Davis trying to find peace making scheme for coal industry. They collect wage data (Vol. 21, No. 3, p. 146).

Jan. 14—T. H. Watkins urges Westmoreland operators to join National Coal Assn. saying it can protect operators' interests as can no other agency (Vol. 21, No. 3, p. 147).

Jan. 14—Missouri Circuit Court judge removes temporary injunction preventing U. M. W. of A. from ousting Alex Howat in Kansas-Missouri union district (Vol. 21, No. 3, p. 147).

Jan. 15—About 100 New River mines resume operations on 1917 scale (Vol. 21, No. 4, p. 178).

Jan. 16—Railroad case against cut in coal rates weakened by doubtful testimony before I. C. C. J. D. A. Morrow says rate cut will increase traffic enough to reduce operating expenses (Vol. 21, No. 3, p. 145).

Jan. 17—Anthracite reaching New England is so poor that Mass. state fuel administrator advises refusals of it (Vol. 21, No. 4, p. 176).

Jan. 18—Keeney, Mooney and Blizzard released from Logan county jail on $15,000 and $20,000 bail (Vol. 21, No. 5, p. 219).

Jan. 21—Anthracite miners in Shamokin convention demand 20 per cent increase in pay and many changes in conditions or they strike April 1 (Vol. 21, No. 4, p. 179).

Jan. 23—Pennsylvania state auditor announces he will collect 1½ per cent tax on anthracite in spite of case to test tax law's constitutionality (Vol. 21, No. 4, p. 175).

Jan. 23—Nova Scotia Court of Appeals suspends injunction preventing coal companies from reducing wages (Vol. 21, No. 4, p. 175).

Jan. 23—Supreme Court again postpones rehearing of Coronado Coal Co. case against miners' union, this time to March 20 (Vol. 21, No. 4, p. 193).

Jan. 24—Anthracite operators' statement says union wage demands would add $1.30 per ton to anthracite price (Vol. 21, No. 5, p. 219).

Jan. 26—Pittsburgh Coal Operators Association and (Jan. 28) Southern Ohio coal operators post scales showing reductions of 30-47 per cent. Say they will not pay check-off. Union officials silent (Vol. 21, No. 5, p. 219).

Jan. 27—Senator Kenyon's report to Senate after investigation of West Virginia coal "war" calls coal a public utility and suggests to Congress a national "industrial code" and a federal arbitration board for mine labor disputes (Vol. 21, No. 5, pp. 215-216).

Jan. 28—Committee of three named to settle demurrage bills of old Tidewater Coal Exchange (Vol. 21, No. 5, p. 218).

Jan. 29—Attorney-General Daugherty says government will not define legitimate scope of trade association activities but associations "doing a legitimate business" will be encouraged. General uncertainty as to associations continues (Vol. 21, No. 5, p. 217).

February

Feb. 1—President Lewis of miners union invites 16 major unions of railroaders, to join miners in "economic alliance." Feb. 6 he refuses to affirm or deny report that only one accepts (Vol. 21, No. 6, p. 261).

Feb. 2—Country's coal stocks Jan. 1 were sufficient for but 32 days as compared to 43 days stock Nov. 1 Bureau of Census and Geological Survey announces (Vol. 21, No. 6, p. 259).

Feb. 2—Forty miners killed by explosions, 25 in Gates mine of H. C. Frick Co., Brownsville, Pa., six in Layman Calloway Coal Co. mine in Bell County, Ky., and nine convicts in Bell Ellen mine of Bessemer Coal, Iron & Land Co., Bibb county, Alabama (Vol. 21, No. 6, p. 258).

Feb. 2—Anthracite tax act of 1921 upheld by court of common pleas in Dauphin county (Vol. 21, No. 6, p. 258).

Feb. 4—Wage reduction of 30 per cent announced for Monongalia County, W. Va., by operators effective April 1 (Vol. 21, No. 7, p. 296).

Feb. 5—Attorney General formulates plan to help prevent April 1 strike but does not announce it (Vol. 21, No. 6, p. 257).

Feb. 6—Winding Gulf Assn. announces smokeless production in West Virginia for 1921 was only 29,800,000 tons as compared with 32,000,000 in 1920 and 36,000,000 in the peak year 1916 (Vol. 21, No. 6, p. 255).

Feb. 6—League of Industrial Democracy headed by Robert Morss Lovett and Chas. P. Steinmetz protests increase in hard coal prices (Vol. 21, No. 6, p. 257).

Feb. 6—Nova Scotia wage cut for coal miner to levels recommended in McKinnon award of 1920 is advised by Board of Conciliation. Day men would be cut 12½ per cent and all others 20 (Vol. 21, No. 6, p. 257).

Feb. 8—Secretary Hoovers 11 questions to Attorney General Daugherty on trade association scope of activity all get affirmative reply constituting new code for associations (Vol. 21, No. 7, pp. 297-8).

Feb. 8—Consolidation Coal Co. buys Carter Coal Co. including four smokeless field mines, thus entering smokeless operation at last (Vol. 21, No. 7, p. 300).

Feb. 10—Southern Appalachian Coal Operators Assn. votes to resist "closed shop" and check-off thus ending "open shop" agreement with union in that district (Vol. 21, No. 7, pp. 300).

Feb. 11—John Lewis announces all important rail unions accept invitation to meet miners in Chicago Feb. 21 (Vol. 21, No. 7, p. 301).

Feb. 13 — Market grows notably stronger. Stocking begins in earnest. Prices rise somewhat (Vol. 21, No. 7, p. 302).

Feb. 13—War Department reports it cost $150,000 to send troops into West Virginia coal fields in September and October (Vol. 21, No. 7, p. 313).

Feb. 13—Virtually all the western coal states are suing for freight reductions. Colorado wants 35 per cent off (Vol. 21, No. 7, p. 314).

Feb. 13—President Lewis of miners union in final statement before union convention at Indianapolis says: "Miners do not desire strike and will do everything possible to prevent it, as public will realize when convention has finished its work" (Vol. 21, No. 7, p. 301).

Feb. 14—Scale committee of miners union reports to convention favoring maintenance of existing wages, "8-hr. day underground." Farrington of Illinois says no five-day weeks, 6-hr. days, or radical demands will be made (Vol. 21, No. 7, p. 301).

Feb. 14—Senator Kenyon files bill based on his coal report. Would set up National Coal Mining Board of nine men representing operators, miners and public (Vol. 21, No. 8, p. 342).

Feb. 15—Dept. of Labor conciliators in report to President blame union for West Virginia field "war" and say there is little suffering among miners and no evictions by companies (Vol. 21, No. 8, p. 342).

Feb. 15—Freeport Thick Vein operators announce 34 per cent wage reduction for April 1 (Vol. 21, No. 8, p. 343).

Feb. 15—Rep. Robison of Kentucky introduces resolution for general investigation of coal-mining industry (Vol. 21, No. 8, p. 343).

Feb. 15—Union calls off strike of 700 miners in Clinton field of Indiana who struck to compel re-employment of a discharged pumper (Vol. 21, No. 8, p. 354).

Feb. 15—Former Gov. Harding of Iowa, Gail Borden of New York, and other capitalists form Pocahontas & Sewanee Coal Co. and buy 13,000 acres near Pikeville, Tenn. (Vol. 21, No. 8, p. 355).

Feb. 15—Sewall's Point Coal Exchange and Lamberts Point Exchange both quit business (Vol. 21, No. 12, p. 507).

Feb. 16—Eight men killed recently in explosion wrecking Pond Creek mine of Marietta Coal Co. in Ohio (Vol. 21, No. 7, p. 312).

Feb. 18—Miners convention at Indianapolis adopts "suicidal" demands for six-hour day, five-day week and annual income sufficient to maintain miners decently. Farrington leads anti-Lewis faction and embarasses Lewis at times during meeting though Howat rehearing is denied (Vol. 21, No. 8, pp. 337-9).

Feb. 18—Howat, deposted Kansas union president sentenced to jail for failing to observe anti-strike injunction of Kansas Industrial Court, appeals to

U. S. Supreme Court (Vol. 21, No. 8, p. 341).

Feb. 18—Cambridge Collieries Co. buys mine and 8,000 acres from Morris Coal Co., near Senacaville, Ohio (Vol. 21, No. 9, p. 395).

Feb. 20—Market subsides again after small flurry. Prices recede slightly (Vol. 21, No. 8, p. 344).

Feb. 20—Coal mining accidents in 1921 reduced, Bureau of Mines report says. Fatalities decreased 13 per cent but rate per million tons is 3.99 as compared to 3.52 for 1920 (Vol. 20, No. 8, p. 353).

Feb. 20—Deep Vein Coal Co. mine caves at Princeton, Ind., and 400 men escape by air shaft (Vol. 21, No. 9, p. 394).

Feb. 20—Consolidation Coal Co. buys land for $500,000 on Clay and Knox county border, Kentucky (Vol. 21, No. 9, p. 394).

Feb. 20—Constitutionality of Pennsylvania anthracite tax act is questioned in Supreme Court on an appeal from Dauphin county (Vol. 21, No. 9, p. 382).

Feb. 20—Circuit Court of Appeals in New York requires debtor members of defunct Tidewater Coal Exchange to settle debts totaling $1,000,000 to the Exchange (Vol. 21, No. 10, p. 420).

Feb. 21—Illinois operators tell Lewis they are willing to meet him in four-state conference. Indiana says there's no use of a conference if whole Central Competitive field isn't in. Southern Ohio and Western Pennsylvania will not meet. Northern Ohio will attend if rest do (Vol. 21, No. 9, p. 381).

Feb. 24—J. E. McCoy resigns secretaryship of Southern Appalachian Coal Operators Assn. after 12 years service (Vol. 21, No. 10, p. 419).

Feb. 24—Railroad unions give miners only "moral support" in alliance conference at Chicago (Vol. 21, No. 9, p. 383).

Feb. 25—Anthracite operators after two-day conference agree to meet union officials in New York March 15. If they have a wage program they will not announce it (Vol. 21, No. 9, p. 383).

Feb. 27—Kanawha operators tell union if it persists in refusing to meet them before March 11 they will post a reduced wage scale without check-off (Vol. 21, No. 9, p. 382).

Feb. 27—National Grange officials urge farmers to oppose coming coal strike (Vol. 21, No. 10, p. 423).

Feb. 28—Preston County, W. Va., operators reduce wages (Vol. 21, No. 9, p. 380).

Feb. 28—Peabody interests and others in Illinois to withdraw before April 1 from National Coal Assn. (Vol. 21, No. 9, p. 382).

Feb. 28—Lehigh Coal and Navigation Co. announces its million dollar anthracite breaker at Coaldale, Pa., will be ready for use April 1 (Vol. 21, No. 9, p. 395).

March

March 1—U. S. Steel Corporation announces its mines produced 21,000,000 tons of coal during 1921 as compared to 30,000,000 tons in 1920 (Vol. 21, No. 13, p. 558).

March 1—After a survey, an engineer for Northumberland county, reports the county's anthracite mines are worth $91,000,000. They are taxed at $67,000,000 (Vol. 21, No. 10, p. 435).

March 1—Illinois operators propose to President Farrington that miners and operators of state hold wage conference. He puts it up to Lewis who says "No," (March 4). Farrington, the union rebel, keeps operators on the string by saying state union meeting will consider matter further (Vol. 21, No. 10, p. 421).

March 1—Nova Scotia operators and union officials reach agreement which goes to men on referendum (Vol. 21, No. 10, p. 422).

March 1—Western Canada's 9,000 union miners will strike if wages are cut April 1, official says (Vol. 21, No. 10, p. 422).

March 2—Miners numbering 1,400 at Old Forge Colliery, Old Forge, Pa., strike to force discharge of miner who was earning too much (Vol. 21, No. 15, p. 623).

March 6—Rail officials oppose coal freights before I. C. C., saying reduction would have little effect in prices in general (Vol. 21, No. 10, p. 419).

March 6—Secretaries Hoover and Davis each make informal efforts to produce peace in coal mining but without noticeable result (Vol. 21, No. 10, p. 423).

March 10—Western Pennsylvania and Southern Ohio tell Secretary Davis they will not change decision not to meet miners in four-state parley. Central Pennsylvania warns government it is "complicating matters" by its suggestion for a four-state conference (Vol. 21, No. 11, pp. 461-2).

March 10—Eight miners are killed and 10 missing in explosion at Sopris mine No. 2 of C. F. & I. Co. near Trinidad, Col. (Vol. 21, No. 13, p. 558).

March 12—Farrington gets into telegraphic tilt with Lewis over Illinois separate wage negotiation offer, but gives operators no definite answer as to time of meeting them (Vol. 21, No. 11, p. 461).

March 13—Supreme Court dismisses Alex Howat's plea against Kansas Industrial Court (Vol. 21, No. 11, p. 460).

March 13—State troops of West Va. dispatched to Thomas to guard miners of Davis Coal & Coke Co. at work on new low scale (Vol. 21, No. 12, p. 507).

March 13—Peabody Coal Co. claims biggest February production of any company in the country—829,000 tons. Buys Carterville & Big Muddy mine at Carterville, Ill. (Vol. 21, No. 11, p. 474).

March 15—Anthracite miners' wages 152 to 166 per cent higher than before the war and far higher by comparison than wages in any other industry, investigation for National Industrial Conference Board shows (Vol. 21, No. 12, p. 501).

March 15—Farrington agrees to meet Illinois operators separately before March 31 unless Lewis succeeds in getting an interstate conference in meantime (Vol. 21, No. 12, p. 506).

March 20—Consensus in Washington is that government is not going to intervene to prevent coal strike (Vol. 21, No. 12, p. 499).

March 20—Fairmont operators reported to be seeking settlement with union granting check-off in return for a scale. All regions in Central Competitive field maintain original positions. Southwestern Inerstate District has had two meetings with miners without accomplishment (Vol. 21, No. 12, p. 505).

March 20—I. C. C. begins hearings on inequalities in freight rates to ports on bunker coal and all other coal (Vol. 21, No. 12, p. 506).

March 20—Pittsburgh Coal Producers' Assn. delegates assemble at appointed time and place for union conference but no union men appear (Vol. 21, No. 13, p. 547).

March 20—Anthracite mining companies prepare to resist taxation under new act. Companies such as P. & R. Coal & Iron Co. are making agreements with Dauphin county officials on valuations much lower than proposed new ones (Vol. 21, No. 12, p. 519).

March 21—Indiana Bituminous Coal Operators Assn. frames up scale showing 30 to 40 per cent decreases over existing one. Secretary Penna now tells Lewis Indiana is willing to meet miners. Lewis refuses (Vol. 21, No. 13, p. 547).

March 21—President Lewis of miners' union declares strike beginning April 1 of all union mine workers of U. S. and Canada, Nova Scotia excepted. He doesn't even wait for finish of strike referendum to union men who are voting 19 to 1 for strike, Secretary Green says (Vol. 21, No. 13, p. 546).

March 23—Miners refuse to meet Southern Ohio operators (Vol. 21, No. 13, p. 547).

March 23—Rep. Bland (Ind.) introduces bill in House at Washington creating commission to "inquire into and report on the coal industry." Senator Borah (March 27) threatens to demand government investigation of causes for impending strike (Vol. 21, No. 13, p. 544).

March 25—Orient No. 1 mine of Chicago, Wilmington and Franklin Coal Co. sets world's record for 8 hours hoisting of soft coal with work of 8,210 tons, beating nearest competitor Zeigler No. 1 mine of Bell & Zoller by 947 tons (Vol. 21, No. 13, p. 547).

March 25—Miners officials in District 17, the Fairmont Kanawha region, meet operators but decline to make a contract saying they were "without authority to take such action until the Central Competitive Field scale has been made" (Vol. 21, No. 13, p. 547).

March 25—Country's coal stocks total 52,000,000 tons, greatest since Armistice Day, U. S. Geological Survey reports (Vol. 21, No. 13, pp. 542-3).

March 27—Farrington, union president in Illinois, finally sets March 29 as date for meeting with Illinois operators (Vol. 21, No. 13, p. 547).

March 27—Heavy production and quiescent market pull spot price of coal down materially, as country goes into strike period with heavy reserves (Vol. 21, No. 13, p. 548).

March 28—Pittsburgh and Central Pennsylvania operators post reduced scale offering 77 cents a ton for pick mining, 50 cents for loading and $4.50 $4.60 per day labor (Vol. 21, No. 14, p. 584).

March 29—Farrington meets Illinois operators, tells them he can do nothing toward making separate state deal unless "an emergency arises" but fails to define "emergency" (Vol. 21, No. 14, p. 583).

March 29—Kanawha operators adopt new scale showing 30 per cent cuts (Vol. 21, No. 14, p. 589).

March 30—Conference of operators and miners adjourns until April 3, having accomplished nothing (Vol. 21, No. 14, p. 584).

March 31—Orient No. 1 and Zeigler No. 1 mines of Chicago, Wilmington and Franklin Coal Co. and Bell & Zoller, respectively, ran world's greatest production race during March. Zeigler set world's record for month's hoist with tonnage of 164,109. On March 25 Orient mine broke daily hoist record with 8,218 tons (Vol. 21, No. 14, p. 586).

April

April 1—A. M. Ogle tells House committee at hearing on Bland bill that operators refused to meet miners in four state negotiation because of disruption of the agreement by the union, court decisions declaring national agreements unlawful and economic conditions caused by non-union competition (Vol. 21, No. 14, p. 587).

April 1—General strike of union miners takes place. Non-union regions but little affected (Vol. 21, No. 14, p. 589).

April 2—For first time in history of West Virginia union local was held liable for damages for suspending a member, at Lumberport, W. Va. (Vol. 21, No. 14, p. 581).

April 2—President Lewis of miners' union, declares "some national authority over coal mining is necessary" (Vol. 21, No. 14, p. 585).

April 4—Chairman Nolan of House Committee on Labor invites operators of Central Competitive Field to meet miners in Washington, saying Lewis would meet any group large enough to negotiate. Every state maintains original position and no meeting is held (Vol. 21, No. 15, p. 625).

April 5—March shipments of anthracite total 6,778,667 tons which makes it third among list of Marches of past years, Anthracite Bureau of Information announces (Vol. 21, No. 16, p. 664).

April 6—Attorney General Daugherty writes Rep. Bland (Ind.) saying the government had no intention of disturbing a Central Competitive Field negotiation (Vol. 21, No. 15, p. 629).

April 7—John Grophy of miners' union tells House Committee on Labor that there should be a commission to investigate the whole coal industry (Vol. 21, No. 15, p. 627).

April 10—Up to now union has been successfully invading the Connellsville coke region (Vol. 21, No. 15, p. 628).

April 10—Supreme Court dismisses for lack of jurisdiction the Lambert's Run case of coal company against rail-

road for failure properly to allot cars (Vol. 21, No. 15, p. 629).

April 12—First coal cargo of season leaves Buffalo for Chicago (Vol. 21, No. 16, p. 683).

April 13—Gillen board of inquiry into Nova Scotian coal mining resions and is replaced by another board (Vol. 21, No. 16, p. 669).

April 13—Secretary Hoover declares in letter to Atty. Samuel Untermeyer that he is absolutely against open price trade associations but believes strongly in those whose functions are legitimate (Vol. 21, No. 16, p. 671).

April 15—Removal of 148 bodies from a Polish cemetery at Plymouth, Pa., to prevent their falling into caving mines is started (Vol. 21, No. 16, p. 683).

April 16—Rep. Johnson of Kentucky gets house at Washington to adopt amendment to Dept. of Justice appropriation bill forbidding prosecution of labor unions and farmers associations under the anti-trust act (Vol. 21, No. 16, p. 666).

April 17—Rep. Bland (Indiana) introduces new bill for commission of 10 representing operators, miners and public to investigate whole industry (Vol. 21, No. 17, p. 705).

April 17—Case to test constitutionality of Pennsylvania anthracite tax law goes to Supreme Court (Vol. 21, No. 16, p. 670).

April 17—Rep. Huddlesm (Alabama) introduces bill providing that federal court receiver shall operate any mine that suspends production and shall not return the property until operation is guaranteed by owner (Vol. 21, No. 16, p. 670).

April 17—Second week of strike finds public apathetic. West Virginia operators get injunctions from Judge McClintic restraining union from organizing there. No breaks in ranks of either operators or miners and no sign of federal intervention Lewis is said to be anxious for (Vol. 21, No. 16, p. 667).

April 19—There are 289,000 miners on strike in Pennsylvania including 95,000 in anthracite fields state bureau of labor reports (Vol. 21, No. 17, p. 704).

April 21—Dr. Harry A. Garfield tells Survey Associates, Inc., at New York banquet that he opposes public ownership of mines and proposes his 1919 idea for coal advisory commissions for both anthracite and bituminous. Philip Murray, vice president of U. M. W. of A. proposes joint fact finding commission and says strikers would go back to work at 1920 commission award (Vol. 21, No. 17, p. 705).

April 24—Twenty-three miners go on trial for treason at Charlestown, W. Va., for "levying war on State of West Virginia" claim indictments are invalid (Vol. 21, No. 17, p. 711).

April 24—Three hundred miners in Bridgeport, Tex., accept wage cut of $1.50 a day and 25 cents a ton and go back to work (Vol. 21, No. 18, p. 751).

April 25—Judge McClintic of U. S. District Court, perpetuates injunction against union proselyting in West Virginia Winding Gulf field, declares union and operators of Central Competitive Field conspired to curtail West Virginia production ever since 1898 (Vol. 21, No. 18, p. 751).

April 26—Anthracite conference resumes in New York, S. D. Warriner says (April 27) that 47,000 miners in hard coal in 1921 averaged earning $1,803.55 per year (Vol. 21, No. 18, p. 750).

April 28—Small riots around a mine or two and fusillade of shots in Carbon county draw out state troops in Utah (Vol. 21, No. 18, p. 751).

April 29—Union miners in West Virginia announce they will stand by the international organization no matter what course is taken by other states where the union is of doubtful strength (Vol. 21, No. 19, p. 793).

May

May 1—Counsel for 23 union miners on trial at Charles Town, W. Va., for treason fail to get indictments quashed but court upholds demand for bill of particulars citing overt acts of each prisoner (Vol. 21, No. 18, p. 753).

May 1—In fourth week of strike, production, demand and price all increased noticeably (Vol. 21, No. 17, p. 749).

May 1—U. S. Chamber of Commerce prophesies coal panic early in June for stocks will have gone below 20,000,000 ton mark by that time (Vol. 21, No. 18, p. 749).

May 2—Many coke workers in Connellsville district go back to work and others serve notice on union they will too, unless strike benefits are forthcoming at once (Vol. 21, No. 18, p. 751).

May 2—House Committee on Labor favorably reports Bland bill for a fact finding commission made up of directors of Bureau of Mines and Geological Survey, Commissioner of Labor Statistics and two representatives each of the public, the miners and the operators (Vol. 21, No. 19, p. 793).

May 3—Miners propose investigation by I. C. C. into anthracite freight rates. Operators say this is only an effort to detract attention from the main business which is the formulation of another wage scale (Vol. 21, No. 19, p. 791).

May 5—Sporadic outbursts of trouble in Utah climaxing in an attack on Carbon County mines where 500 or more shots were fired cause appeals for state troops. Fifty deputy sheriffs are already at Winterquarters and Scofield, President of Utah federation of labor, threatens a general strike if troops are sent out (Vol. 21, No. 19, p. 794).

May 6—Many small disturbances in Colorado up to date but no serious outbreaks. Several mines are working light even in the union stronghold around Canon City (Vol. 21, No. 19, p. 795).

May 9—Anthracite miners in continued conference with operators, refuse to agree to four-year basis for a contract and adjourn to May 16 (Vol. 21, No. 20, p. 853).

May 12—Rep. Petersen (N. Y.) introduces bill at Washington for commission of three to investigate costs between mine and consumer (Vol. 21, No. 20, p. 853).

May 12—Miners' union orders men out of every licensed mine in Ohio, thus closing private and co-operative operations (Vol. 21, No. 21, p. 895).

May 13—Federal Trade Commission files brief and argument in District of Columbia Court of Appeals sustaining its contention it has a legal right to require cost data of Claire Furnace Co. and others (Vol. 21, No. 20, p. 855).

May 14—Production in West Virginia grows heavier with increasing market demands. All fields except Kanawha report great union defections and even the latter field is working 35 mines (Vol. 21, No. 20, p. 854).

May 14—Railroads and some other big industrial buyers form a sort of buying pool with representatives in various fields to restrain ballooning of prices by lessening buying competition (Vol. 21, No. 20, p. 862).

May 15—Markets are topsy-turvy with demand strengthening and railroads buying more heavily. *Coal Age* Index now has ascended to 261, an increase of 31 points in a week (Vol. 21, No. 20, p. 856).

May 15—Development of coal lands in Chicaloon district of Alaska for Navy is planned by Department of Interior. Lake and Export Coal Corporation is to make field examination (Vol. 21, No. 20, p. 866).

May 18—Governor of Utah invokes old law and orders all aliens to surrender firearms before noon of May 22 to prevent further disorder (Vol. 21, No. 21, p. 896).

May 18—Anthracite operators refuse miners' 19 demands, saying that to grant them would impose annual burden of $170,000,000 on the industry. They propose decrease of 18 per cent in contract rates $1.20 a day for men and 72 cents a day for boys and five-year agreement (Vol. 21, No. 21, p. 890).

May 18—Fifty non-union operators at Hoover price control meeting, agree to use Garfield 1917 scale as basis for fair prices today. General conference of operators now producing is called for May 31 (Vol. 21, No. 21, pp. 890-1-2).

May 18-20—National Retail Coal Merchants' Assn. condemns profiteering and other evils of the industry in annual convention at Chicago (Vol. 21, No. 21, p. 897).

May 19—Presentation of the case for the defence in the treason trial of William Blizzard at Charles Town, W. Va., starts. Judge overrules motion to direct verdict of not guilty (Vol. 21, No. 21, p. 894).

May 20—Average margin of about 9 per cent is profit of bituminous industry during past four years—the best years in coal history, J. D. H. Morrow tells House Committee in Bland bill hearing (Vol. 21, No. 21, p. 883).

May 20—Rabbi Wise accepts invitation of Secty. Lewis of New River Coal Operators' Assn., to investigate suffering of miners in West Virginia. Mr. Lewis says the stories of deprivation are exaggerated (Vol. 21, No. 21, p. 896).

May 22—F. S. Peabody tells International Railway Fuel Assn. in convention that coal mines lose $400,000,000 a year through idle time and that ruthless competition is going to solve the coal industry's problem of over development (Vol. 21, No. 22, p. 937).

May 23—A 10 per cent wage increase effective June 1 has been announced by the Tennessee Coal, Iron & Railroad Co. to its miners in Alabama (Vol. 21, No. 22, p. 934).

May 24—A. M. Ogle elected president of National Coal Assn. at annual convention in Chicago indicates association will take a hand in labor problems hereafter, though it will not attempt to make wage agreements (Vol. 21, No. 22, p. 935).

May 25—Anthracite miners reject operators' proposal of 18 per cent wage reduction and reassert original demands thus lessening chances of succes at the miner-operator New York conference (Vol. 21, No. 22, p. 933).

May 27—President Farrington of the Illinois miners finally says "No" to the operators pressing him for a single-state wage conference. He admits frankly he cannot do it until the international union permits, which obviously means Lewis, has at last whipped him into line (Vol. 21, No. 22, p. 934).

May 27—William Blizzard is acquitted of treason arising out of miners' armed march on Logan county, W. Va., last fall. His is first trial of several hundred miners indicted on various charges (Vol. 21, No. 22, p. 936).

May 29—Coal market drops back and prices recede so that *Coal Age* Index now stands at 269. Hoover influence for lower prices and refusal of buyers to go on buying at the peak is knocking prices down (Vol. 21, No. 22, p. 938).

May 31—Secretary Hoover in price conference tells operators there can be no agreement among themselves under the law to keep prices down and that there is no law to furnish profiteers but asks operators to informally assure him Garfield prices, run of mine basis be maintained or maximum with committees in each district to see to it and report offenders. Operators all agree except in Western Kentucky (Vol. 21, No. 23, pp. 975-7).

June

June 1—Pennsylvania employment bureau says 5,000 more miners went back to work in Central Pennsylvania during May. Several Connellsville mines now on normal basis (Vol. 21, No. 24, pp. 1019-20).

June 1—American Wholesale Coal Assn. in annual convention chafes at Hoover price control. No definite decision made as to whether George H. Cushing will be retained as managing director. Seth Morton of Albany is elected president (Vol. 21, No. 23, p. 971).

June 2—Anthracite operators propose arbitration since all direct negotiations have failed to settle upon a new agreement (Vol. 21, No. 23, p. 978).

June 2—Retailers in various centers charge Hoover with hoisting prices by setting a maximum which has come to be a minimum as well and says smokeless that sold for $1.75 now sells for $3.50. This stirs up Senator Borah and others to talk of an investigation (Vol. 21, No. 24, p. 1015).

June 3—Signs of union weakening are seen in statements by William Petry of West Virginia and P. T. Fogan of Pennsylvania union vice-presidents, who say miner-operator conference "by June 15" is to be held and they prophesy

strike will end within 30 days (Vol. 21, No. 23, p. 978).

June 5—Supreme Court unanimously decides Coronado Coal Co. cannot collect strike damages from the miner's union thus reversing lower court, but establishes fact that unions can be sued in federal court for violation of law. In this case the union's responsibility for strike damages to property was not proven (Vol. 21, No. 23, p. 974).

June 5—Coal loaders are driven from slack pile at New Straitsville and attacking party of 200 or more men, shoot one man and injure others in first violence in Hocking Valley field. Judge enjoins union from interfering with work at strip pits (Vol. 22, No. 2, p. 68).

June 5—Coronado Coal Co. gets Supreme Court permission to petition for a reargument of the case against the U. M. W. of A. for strike damages to property (Vol. 21, No. 24, p. 1016).

June 5—Majority of Nova Scotian arbitration board proposes 20 per cent reduction in miners' wages to $3 a day. Minority report signed only by miner representative favors $3.45 (Vol. 21, No. 23, p. 979).

June 6—Homer D. Jones, president of National Retail Coal Merchants' Assn., writes Hoover the price protest of retailers. Hoover replies (June 9) that $1.75 pre-strike price retailers cite is not lump coal such as they sell mainly. Lump price was $3.25 so that increase really is 25 cents not $1.75. Hoover further urges these plans upon retailers a. All coal be sold at cost plus reasonable handling charge. b. Reserve cheap, pre-strike stocks for small household trade. c. Supply large trade from current purchases. d. Co-operate to restrain prices by not buying from mines that exceed Garfield scale. e. Handle coal straight to consumer without speculation (Vol. 21, No. 24, pp. 1015-6).

June 7—Anthracite scale committee decides to reject operators' arbitration plan (Vol. 21, No. 24, p. 1019).

June 9—Utah deputies withdrawn from strike fields duty and no troops are sent in. Foreigners have not generally obeyed governor's order to turn in their firearms (Vol. 21, No. 24, p. 1032).

June 9—Policemen employed by Vinton Colliery Co. at Vintondale, Pa., indicted for assault and battery in preventing public meeting run by A. G. Hays of New York, who tried to hold such a meeting as a test case. He sues Vinton Collieries Co. for $35,000 damages (Vol. 21, No. 24, p. 1021).

June 10—Secretary Hoover tired of politics played by retailers calls upon Roderick Stephens, chairman of the board of directors of the National Retail Coal Merchants' Assn., to "do away with disputes on trivial questions and enter into co-operation with me" (Vol. 21, No. 24, p. 1016).

June 10—District Court in New York decides against five debtor firms in Tidewater Coal Exchange case finding them owing creditor members as follows: Archibald McNeil & Sons Co., $198,000; Johnstown Coal & Coke Co., $17,000; New York & Philadelphia Coal & Coke Co., $11,500; West Virginia & Pennsylvania Coal Co., $72,000; Morrisdale Coal Co., $34,000 (Vol. 21, No. 24, p. 1020).

June 15—Retailers in most regions of the country agree in session at Washington to support Hoover price control plan (Vol. 21, No. 25, p. 1057).

June 16—Illinois & Wisconsin Retail Coal Dealers' Assn., in convention at Lake Delevan, Wis., call upon Hoover to "adjust incorrect and misleading reports" about prices the country over (Vol. 21, No. 25, p. 1059).

June 16—First Illinois coal production of the summer takes place at Herrin strip mine of Southern Illinois Coal Co. now loading coal under heavy guard but without disturbance (Vol. 21, No. 25, p. 1060).

June 16—Utah national guard goes on duty after train is shot up and mine manager wounded. Troops are rounding up armed strikers (Vol. 21, No. 25, p. 1061).

June 16—I. C. C. finally gives Henry Ford right to reduce coal freight rates on D. T. & I. Ry. (Vol. 21, No. 25, p. 1061).

June 17—Vinton Colliery Co at Vintondale, Pa., wins right of supersedeas nullifying injunction miners got to prevent company police from interfering with public meetings (Vol. 21, No. 25, p. 1057).

June 17—Various attacks have been made during the past week on little mines still operating in Indiana (Vol. 21, No. 25, p. 1060).

June 17—Illinois and Indiana operators flatly deny they will go into a four-state conference now (Vol. 21, No. 25, p. 1060).

June 20—Conciliation board in Western Canada recommends reduction of 30 per cent in miners' wages (Vol. 21, No. 26, p. 1100).

June 21—Judge McClintic issues injunction against 149 union men and officials stopping them from practicing intimidation on men working in mines of 70 coal companies in Kanawha field of West Virginia (Vol. 21, No. 26, p. 1101).

June 22—Herrin massacre takes place. Nineteen non-union miners and guards of strip mine killed and many more wounded after mob lays siege to Southern Illinois Coal Co.'s property. A. M. Ogle, president of National Coal Assn., blames John Lewis for inciting miners by wire (Vol. 21, No. 26, pp. 1097-9).

June 23—Two strikers are killed near Clarksburg, W. Va., in fight between union men and guards of non-union miners. However, 177 more mines reopen during latter part of June in Northern West Virginia (Vol. 21, No. 26, p. 1099).

June 24—Pennsylvania supreme court decides that anthracite tax is constitutional (Vol. 21, No. 26, p. 1100).

June 24—Julius Barnes, president of the U. S. Chamber of Commerce asks 1,400 member business organizations to help prevent runaway coal market by making fuel surveys and otherwise co-operating with Hoover (Vol. 21, No. 26, p. 1101).

June 26—President Lewis of miners' union, confers with President Harding and Secretary of Labor Davis. Lewis made the only statement merely saying the situation had been reviewed. Speculation is rife as to possible White House effort to end strike (Vol. 21, No. 26, p. 1101).

June 26—Market jumps up and down in uncertainty with prices generally shading upward. Western Kentucky coal begins to climb notably. Average coal price throughout the country is now $3.44 (Vol. 21, No. 26, p. 1102).

June 30—Pennsylvania Dept. of Labor and Industry in vain offers its services to arbitrate both anthracite and bituminous coal strikes there (Vol. 22, No. 1, p. 25).

July

July 1—Miners at Iverness Coal Co. at Iverness, N. S., threaten strike if wages are cut. Arbitration board is named (Vol. 22, No. 2, p. 68).

July 1—Kentucky-Tennessee Coal Operators Assn. elects J. E. McCoy secretary after his 12 years with Southern Appalachian Assn. (Vol. 22, No. 2, p. 66).

July 1—Wholesalers in an around Cincinnati protest to Hoover because operators in Kentucky take full Hoover price leaving them no margin (Vol. 22, No. 1, p. 24).

July 1—Railway shop men all over the country strike but without any immediate effect on coal shipment.

July 1—President Harding calls operators and miners into conference at the White House. They accomplish nothing on Saturday. Resume Sunday and then adjourn to July 10. Secretaries Hoover and Davis take part (Vol. 22, No. 1, p. 27).

July 1—Anthracite operators and miners meet Secretary Fall who said coal industry should be regulated as a public utility and that government is prepared to fix price of coal to return fair income in investment (Vol. 22, No. 1, p. 27).

July 1—W. B. Reed resigns as secretary of National Coal Assn. to set up in business as expert on mine taxation and accounting (Vol. 22, No. 1, p. 29).

July 1—Union commissaries and bread lines are opened in Terra Haute, Clinton and other Indiana coal mining centers (Vol. 22, No. 1, p. 26).

July 2—Rep. Denison of Illinois explains Herrin massacre as result of miners' reason giving way to passion when mining company violated agreement and imported strike-breakers (Vol. 22, No. 1, p. 24).

July 2—Adjt.-Gen. Hamrock of Colorado, charges Lieut.-Gov. Cooley with addressing mass meeting of striking miners when Gov. Shoup had ordered that no such meetings be held. Gov. Shoup hurries back from vacation (Vol. 22, No. 2, p. 68).

July 2—J. B. McLachlan, secretary-treasurer of the Maritime district of U. M. W. of A., in Nova Scotia, publicly condemns President Baxter for "selling out" the union in the agreement Baxter signed for Nova Scotia. Baxter calls McLachlan a bolshevik (Vol. 22, No. 2, p. 25).

July 2—Smokeless mines of West Virginia now producing at the rate of 3,000,000 tons a month. The Pocahontas field is mining 70,000 tons a day, Winding Gulf, 20,000; New River and Tug River, 20,000 each (Vol. 22, No. 1, p. 26).

July 3—Operators at White House conference propose: (1) Negotiations by districts, (2) Six miners and six operators redistrict the country, (3) Arbitration by districts, (4) President appoint arbitration board of three disinterested men for each district, (5) President name a general investigation board, (6) New wage scales be made by July 15 or referred to district arbitration boards who must report by Aug. 1, (7) U. S. Attorney General pass on legality of this method of settlement (Vol. 22, No. 2, p. 65).

July 5—Howat men in Kansas offer to go back to work seeing opportunity thus to gain reinstatement as union men (Vol. 22, No. 2, p. 68).

July 6—Operators but no miners attend Pennsylvania State Commissioner of Labor Connelley's peace meeting. Operators are for separate district wage agreements (Vol. 22, No. 3, p. 105).

July 6—International Ladies Garment Workers Union votes $100,000 to aid miners (Vol. 22, No. 2, p. 68).

July 7—President Farrington of Illinois miners gets authority from his executive board to call special convention for that state. Illinois operators disclaim any knowledge of what he is going to do (Vol. 22, No. 2, p. 67).

July 9—Union orders interference with pump men in Illinois mines stopped. Companies have been using clerks and other "company men" on such work (Vol. 22, No. 2, p. 67).

July 10—President Harding, seeing the miner-operator conference at the White House is deadlocked, proposes resumption of work at old scale until Aug. 10, while commission of three miners, three operators and five to be named by President works out new scale and makes exhaustive investigation of entire coal industry. President Lewis asked until July 17 to answer after miners whole scale committee assembled in Washington (Vol. 22, No. 2, p. 63).

July 12—Illinois appears to be preparing at last to do something about the Herrin massacre. Atty.-Gen. Brundage offers $1,000 for incriminating evidence and spends two days in Williamson county declaring afterward that he had valuable information (Vol. 22, No. 3, p. 106).

July 12—Shop crafts' strike begins to cripple coal transportation at strategic points on T. & N. and C. & O. (Vol. 22, No. 3, p. 106).

July 15—West Virginia fields produce more than they ever did in their history. Logan, Tug River, Kenova-Thacker and Pocahontas fields exceed normal by 20 per cent or more (Vol. 22, No. 3, p. 106).

July 17—President's conference fails. Miners refuse his proposal to go back to work at the old scale pending formation of new scale by commission. Majority of operators accept but Pittsburgh Operators' Assn., Central Coal Assn., and Indiana operators decline. Operators' majority decision made after most acrimonious series of meetings in coal history. President in disappointment, "invites" all parties to go home and resume operations, a thing which of course none do (Vol. 22, No. 3, 99-100).

(To be continued.)

Asks Legislative Policy to Extend Railroad Credit As Remedy for Coal Problem

The American Railroad Association has made a report to the U. S. Coal Commission in which is discussed some of the problems of the carriers in relation to the production and distribution of coal. The report was prepared by a special committee of which J. E. Roberts of Albany, N. Y., superintendent of transportation of the Delaware & Hudson Co., is chairman.

"We have endeavored to inform the commission as to the causes of the trouble, so far as the railroads are factors in the situation," the report says. "We have set out some facts as to the extent of car shortages in times of peak demand, and have stated our views as to certain suggested remedial measures. We feel that the real remedy is to be found in the adoption by the American people, speaking through legislative bodies and regulating commissions, of policies which will bring about:

"(1) Such an attitude toward the railroads as will convince the public that money invested in railroads will receive a fair return, thereby strengthening railroad credit and making it possible to increase railroad facilities so as to care for the growing transportation needs of the country.

"(2) Peace in the coal industry and in the railroad industry, with such relations between employers and employees as will prevent strikes, the fruitful cause of interrupted production and restricted transportation.

"It has been intimated that an immediate contributing cause of difficulty is found in 'inadequate transportation facilities.' To what extent the conditions which create this impression are attributable to the abnormal overexpansion of the coal industry by the uneconomic multiplication of mine operations it is not our province to determine. It is enough to point out that there is an immediate demand on the part of an important section of the shipping public for additional rail transportation facilities; and, furthermore, the growth of the country and the increase of its commerce would, in themselves, constitute sufficient reasons for developing the carriers' facilities to meet the demands which are sure to be made upon them. But this can be done only by the investment of additional capital, and additional capital can be secured only by the reasonable assurance of a fair return, and this assurance will not exist unless the investing public has reason to expect from the government a liberal, and not a repressive attitude."

The report calls attention to the fact that in 1920 a total of 14,766 bituminous-coal mines were in operation, an increase of 154 per cent over the total number in operation in 1910, while coal production increased only 37 per cent. "This shows a continual decrease in the production per mine," the report says. "Had the 1910 tonnage production per mine been maintained in 1920, the tonnage of that year could have been produced by 7,950 mines instead of 14,766.

"This means that the railroads were called upon to divide the available cars among 6,800 more mines in 1920 than would have been necessary had the average production per mine been maintained on the 1910 basis. Expressed in another way, it meant that the 150,000,000 tons by which the coal production in 1920 exceeded 1910 was gathered from 6,800 additional mines, calling for vastly increased motive power, coal-car supply and man-power for the railroads to serve them all.

"While complete statistics for 1922 are not as yet available, such information as it has in hand justified the conclusion that this tendency toward inflation of the bituminous-coal industry continues.

"The expansion was not confined to the increase in number of mines. The number of cars ordered, based on the rated ability of the mines to produce coal, kept pace with the increase in number of mines, until for the year 1920 the mines ordered cars sufficient to load 830,000,000 tons, which was 46 per cent more than the total consumption of the country.

"In October and November, 1922, after the mines got fully under way following the miners' strike, the mines of the United States ordered cars for 165,000,000 tons, which was at the rate of approximately 1,000,000,000 tons per annum, or at the rate of twice the annual consumption of the country.

"The outstanding feature is the enormous increase in the number of mines contrasted with the relatively small increase in production, and is, we believe, a prime factor contributing to the plight in which the bituminous coal industry and the country finds itself at this time.

"It has been shown that the coal produced increased from 1910 to 1920 37 per cent while the number of mines increased 154 per cent, requiring a greater amount of transportation service. To meet this increased demand the railroads provided additional coal cars, with an increased aggregate tonnage capacity of 42½ per cent, in comparison with an increase of coal tonnage produced of 37 per cent. In addition, the aggregate tractive effort of the motive power provided by the railroads increased 53.1 per cent. Furthermore, the investment in road and equipment, for the purposes of coal and other traffic, increased 39.7 per cent.

"It is therefore pleasing to note the increase in transportation efficiency from the fact that a greater transportation capacity was provided with a minimum increase in individual units. It further indicates an economical policy in providing transportation facilities.

"The results of this policy are to be found in the freight transportation service rendered by the railways during this same period, for in 1920 they handled an increase in freight traffic of 62½ per cent, measured in net ton miles, compared with 1911. This increased freight service in 1920 was accomplished with an actual decrease in the number of freight train miles, while there was an increase over 1911 of 46 per cent in the average train load."

Strikes Have Been Disturbing Factor

The report points out that strikes among certain classes of railroad employees, miners, longshoremen, lake seamen and tugboat men "have all been potent factors in disrupting the orderly and regular flow of coal from producing centers to their normal markets."

"This has thrown undue and abnormal strains upon transportation facilities," the report added, "causing congestion of railway channels and gateways which decidedly slowed up movement of loaded and empty coal cars through such congested channels and gateways, causing great loss of car utilization and decreasing the number of cars available. It will thus be seen that general car-shortage periods are usually related closely to major industrial disturbances.

"It seems that the railways have fairly kept pace with the increase in coal production, but even with such additions and improvement they are unable to provide adequate service to accommodate a sporadic expansion and contraction of the coal industry such as has existed in recent years.

"Notwithstanding the fact that, as shown by the foregoing figures, railroad facilities have increased in greater ratio than coal tonnage, and in spite of the fact that there have been frequent periods when a substantial portion of the carriers' equipment has been stored for lack of traffic, it has also happened that the carriers have been unable to furnish transportation service for the traffic currently offered. In such situations the public insistently contends, as in fact the bituminous-coal operators are doing at the present time, that the facilities of the carriers are inadequate. It is, of course, certain that the commerce of the country will increase with resulting increase of traffic, and that periods will continue to recur when the railroads will be unable, as heretofore from time to time, to transport traffic as offered. If the public desires such service, it is obvious that the facilities of the carriers will have to be substantially increased in order to enable them to meet the public demand, which increase will be possible only in the event that railroad credit is strengthened and a more liberal treatment extended than has heretofore prevailed."

Operator-Road Cenferees Favor Mine-Rating Rules on Each Road to Fit Conditions

After several days' consultation the joint committee of operators and representatives of the railroads called to consider the formulation of recommendations to the Interstate Commerce Commission on the subject of mine-rating and car-distribution rules brought its labors to a conclusion on Jan. 12 and made the following report to Commissioner Aitchison:

"After consideration of the various mine-rating plans submitted by the different railroads and operators throughout the country, and in the light of the record now before the commission, the following was adopted by the joint committee of coal operators and railroad representatives today:

"After carefully studying the mine-rating plans submitted by different railroads and operators throughout the country, we think no set of specific rules can be formulated that would be equitable, just and uniformly applicable to all localities and all railroads, and it is proposed that each carrier or carriers in co-operation with the coal operators along the lines of said carrier or carriers adopt a set of mine-rating rules that will be workable on their railroads, which shall be predicated upon the following:

"(1) That the carriers individually or collectively shall establish and maintain mine-rating and inspection bureaus, or similar agencies, composed of officers or employees exclusively in the employ of the railroads.

"(2) It shall be the duty of this bureau, or agency, in order to prevent the undue inflation of mine rating, in determining the rating of the respective coal mines, to take into consideration the following basic principles: (a) Physical conditions; (b) past performance; (c) labor supply; (d) other factors that may affect the production and shipment of coal.

"(3) There are several codes of distribution rules now before the Interstate Commerce Commission for their consideration, none of which vary materially in fundamentals and which can be generally applied in connection with the proposed mine-rating principles outlined above.

"This is respectfully submitted by the joint committees of coal operators and representatives of coal originating railroads to the Interstate Commerce Commission for their tentative approval."

The coal operators added the following:

"Referring to the attached with reference to the joint conference of the committees representing the coal industry and the railroads, with respect to mine-rating and car-distribution rules:

"It was thoroughly understood, particularly after you addressed the meeting, that the principal objects of the conference should be to make an effort to find some way to prevent the inflation of mine rating in times of car shortage.

"Several codes of mine-rating rules were before the conference. These included all those submitted to the commission during the recent hearing and there was also called for any new suggestion that anyone had to offer, but no new code of rules was presented. There was advanced modifications of some of the rules that had heretofore been submitted for consideration. As the conference progressed and after those present had full opportunity to express their views on every angle of the situation it became clearly evident that none of the rules as written could be satisfactorily applied for the entire country. The operators on the Norfolk & Western made the very definite statement that they were entirely satisfied with the Norfolk & Western plan, that it had worked out satisfactorily to them and that they did not want it changed. The Indiana operators advised that they were entirely satisfied with the round-robin system in operation in that state. There, of course, by an arrangement between the mine workers themselves, all of whom are unionized, they do not go to work unless the car supply is at the mine, so there is not the opportunity for their loading up on a day on which no cars are furnished a lot of mine cars to make a better showing on a day that they do receive the cars. As near as could be ascertained this condition does not exist in any other territory to this same degree.

"Neither the Colorado operators nor the railroad representatives from the territory were present, but they all favor the idle-hour system in effect in Colorado and want to work in accord with that plan.

"Therefore, it finally developed that it was impossible at this time to make effective, by agreement, a uniform code of mine-rating rules that would be applicable to all the varying conditions in the varying territories.

"All in attendance at the meeting appeared to be strongly in favor of some method by which the inflation of mine rating could be prevented and an agreement was finally unanimously reached as to the adoption of the basic principles for establishing any system of mine rating. Particular attention is directed to that part of the attached referring to mine-rating and inspection bureaus. This would in reality be a sort of police system for not only rating the mines but checking the mines from time to time in an effort to prevent inflation.

"It was the unanimous opinion of the railroad representatives and the opinion apparently of the great majority of the coal operators present that in making any rating rules the present rules which gave development mines a preferential car supply should not be rewritten in the new rules but that this feature should be left to the mine-rating or service bureaus and each new operation should be rated strictly on its merits.

"For purposes of the record, the National Coal Association wish to state that a number of the representatives of the various territories in attendance at this meeting were not members of their association. We make this explanation so that it may be understood that this meeting was as nearly as possible representative of the entire country and not of any particular association."

Defence at Herrin Assails State Witnesses; Many Who Have Testified Threatened

The first case growing out of the Herrin massacre of June 22 is rapidly drawing to a close. The defence had practically all of its case in when court adjourned Saturday noon until Monday. The main effort all week had been to cast all sorts of reflections upon the veracity of the state's best witnesses who have testified that Otis Clark, one of the present five defendants, made an inflammatory speech to the mob which led 68 non-union captives from the Lester strip mine near Herrin, Ill., after the siege, and that Clark was one of two men who led crippled C. K. McDowell, mine superintendent, down a road and shot him and that the other four defendants played leading parts in the massacre. The defense witnesses also have testified that Clark was not at the place where McDowell was killed nor at the spot where the prisoners were shot to pieces running for their lives through a barbed-wire fence. These witnesses have been more or less in doubt about several points under cross questioning. All of them have said they knew not a man in the mob.

Dire threats have been laid at the doors of five or six of the principal state's witnesses in the form of letters accompanied by pieces of hangman's rope. They demand that the witnesses retract their testimony or be killed. The union organization, which is defending the whole case, declares this would-be campaign of frightfulness must be the work of "reds" outside the union who wish to throw all the discredit they can upon unionism. The business and professional practice of state's witnesses in the town of Herrin have suffered greatly since the trial started.

The defence has asked for the list of the indicted men whom the state proposes trying for the murder of John Shoemaker. That case will follow the present one. The state says it cannot be sure of the list until it learns the outcome of this first trial.

The State of Illinois is about to put $75,000 in the hands of Attorney General Brundage to prosecute the case further. A bill carrying such an appropriation has already been approved by the Senate Committee on Appropriations. Before the Attorney General began working on the case last summer, he had no funds and the Illinois Chamber of Commerce raised approximately $50,000 for him by solicitation through the chambers of commerce throughout the state.

Expect Contracts to Be Signed When U. S. Guarantees Immunity from Prosecution.

The West believes now that the present contract with mine-union labor will be signed for another year, as the United States Coal Commission requested. There is no doubt that negotiations toward that end will be begun at New York soon after the miner-operator conference starting Jan. 18. Illinois on Wednesday, Jan. 10, accepted the invitation to the meeting and Indiana's scale committee of operators is all ready to start. But there are obstacles to be overcome. The contract is not yet signed.

The main obstacle is the ever-present danger of federal prosecution of both miners and operators for making contracts on the four-state basis which the commission now favors. Both Indiana and Illinois go into the New York conference ready to sign if government sanction is given. The operators are by no means clear in their own minds about who is to give such sanction and guarantee it to hold water.

If President Harding could go to Congress and "get authority within twenty-four hours" to seize the coal mines of the country, as he threatened last summer, it is supposed he can now go to Congress and, within about the same length of time, get immunity from prosecution assured to operators and miners who do as the commission suggests. The New York conference will try to determine whether the President should be asked to do it or whether immunity should be obtained from some other official source.

While many other debatable points may arise in the conference, especially if the miners insist upon a contract for two years instead of one, the immunity question is expected to be the main one.

As operators gather in New York in advance of the meeting the opinion is more or less freely expressed that the commission has helped the operators out of a hole, although many are dissatisfied to have the government assume any position in the matter. Operators are saying that they would have had slim chance of winning a strike in 1923, after what happened in 1922, and to have the Coal Commission step in and assume the responsibility for holding wages up another year relieves them from the task of giving in or starting a hopeless fight.

In the East the union operators are expecting a very dull market this summer, with a repetition of strenuous non-union competition paralleling that of 1921. This they say means union mines closed down in every field. It is asserted that it is cheaper to close a mine down without a strike than with one, and if the union insists on its present wage scale, it may have it, without the work. There seems to be no one who now expects a strike this year.

The telegram from John Lewis and Philip Penna, dated Jan. 8, calling the meeting of the operators and miners of the old Central Competitive Field in New York on Jan. 18, follows:

"Acting, as we believe, in the interest of the coal industry and in accordance with sound public policy, the undersigned individuals request that a joint conference of the accredited representatives of the operators and miners of the Central Competitive Field, including western Pennsylvania, Ohio, Indiana and Illinois, meet at the Pennsylvania Hotel, New York City, at 11 o'clock a.m., Jan. 18, 1923, for the purpose of negotiating a wage contract effective April 1, 1923.

"We suggest that the representation be as in our previous interstate conferences—eight operators and eight miners from each of the four states. Kindly reply by wire to P. H. Penna, Opera House Block, Terre Haute, Ind., advising of the action taken upon this request."

Harry N. Taylor Succeeds G. F. Getz as President of U. S. Distributing Corp.

Harry N. Taylor, vice-president of the Central Coal & Coke Co., of Kansas City, Mo., has been made president of the United States Distributing Corporation and will soon establish offices in New York and Chicago. George F. Getz, head of the Globe Coal Co., one of the biggest Chicago coal jobbing houses, who has directed the corporation for three years as president and chairman of the board of directors, retains the chairmanship and will give much less of his time to the organization. Mr. Taylor, who resigns as vice-president of the Central Coal & Coke Co., also resigns the presidency of the Southwest Interstate Coal Operators Association and completely severs his active connection with coal operation in the Kansas and Oklahoma field, where he has been a dominant factor for years. Previously he operated in northern Illinois and Iowa.

Mr. Taylor has spent 40 years in the coal business, beginning with the Sunday Creek Coal Co., of Columbus, Ohio. He was at one time president of the National Coal Association. For years Mr. Taylor's voice has been heard with respect in the labor councils of the coal industry.

The United States Distributing Corporation was organized several years ago by the late Francis W. Peabody, of Chicago, and a group of associates including Mr. Getz; Fred W. Upham, president of the Consumers Co., the largest retail coal organization in Chicago, and coal and financial men in New York and elsewhere. The corporation is a financing organization designed to finance and link up various enterprises directly or indirectly concerned with coal. Beginning with a capital of several million dollars it now has heavy investments and controls several coal interests as well as the United States Trucking Corporation of New York City.

General Goethals Succeeds W. H. Woodin As New York Fuel Administrator

General George W. Goethals, builder of the Panama Canal, was named as State Fuel Administrator of New York by Governor Alfred E. Smith on Jan. 9 to succeed William H. Woodin. He was sworn in the following day and immediately assumed the duties of the office. General Goethals will receive a salary of $2,500 per month.

General Goethals announced that he contemplated making no changes in the personnel of the Fuel Administrator's office except in one or two instances where the officers have insisted upon being relieved. He said he expected to continue the policy followed by Mr. Woodin.

Colonel William J. Donovan, of Buffalo, who was counsel to the Fuel Administration, resigned and was succeeded by Colonel C. W. Wickersham.

General Goethals, accompanied by Mr. Woodin, went to Philadelphia on Jan. 12 to have a conference with E. W. Parker, of the Anthracite Distribution Committee.

I. C. C. Amends Service Order 32

The Interstate Commerce Commission has issued amendment No. 1 to its Service Order No. 32, authorizing the Pennsylvania R.R. to assign hopper-bottom cars to the No 5 mine of the Arrow Coal Mining Co. at Reitz, Pa., at the rate of five cars per day for five consecutive days. The cars are to be consigned to the Government Fuel Yards and are not to be counted against the distributive share of the mine.

In notifying F. R. Wadleigh of his appointment as Federal Fuel Distributor, the President wrote: "The resignation of C. E. Spens as Federal Fuel Distributor becomes effective Jan. 1, and I am writing to notify you of your appointment as Federal Fuel Distributor to succeed to the duties heretofore performed by Mr. Spens. Your appointment is in conformity with the act of Congress of Sept. 22, 1922. Your services as assistant to the Federal Fuel Distributor have already acquainted you with the policy of the government in keeping that service in touch with the Secretary of Commerce and the Interstate Commerce Commission. You will, of course, maintain this intimate relationship as heretofore."

Directors of the National Coal Association and operators from many fields met in New York on Tuesday, Jan. 16 Routine business was transacted.

Coal Commission to Report Again March 15; Public Hearings to Be Held Soon

With its Jan. 15 report behind it, the President's Coal Commission now is concentrating its attention on the public hearings which it will hold in the near future. Matters pertaining to the scope, time and places of these hearings are now occupying the commission.

It was revealed on Jan. 13 that further tentative reports are to be forthcoming. The next report to the President and to Congress will be made on March 15. It is anticipated that it will be possible to include in that report some pertinent data as to wages and earnings. Another of the series of reports will go into the matter of profits, Chairman Hammond declared.

Returns now have been received from 40 per cent of the bituminous production, Mr. Hammond stated. There has been little or no protest on the part of the producers, he asserted, despite the fact that the compilation of the facts and figures for these questionnaires is an onerous task.

The commission regards the matter of restricting anthracite exports as coming under the jurisdiction of the Federal Fuel Distributor. This question has not been brought officially before the commission, however.

Fuel Administrators Warn Coal Buyers

As a warning to prospective purchasers of coal that they should assure themselves of the responsibility and standing of concerns offering coal for sale and shipment, F. R. Wadleigh, Federal Fuel Distributor, has made public the following correspondence with the chairman of the Pennsylvania Fuel Commission in regard to reports which have been received of the shipment of unmerchantable coal. Under date of Jan. 2, 1923, Mr. Wadleigh wrote W. D. B. Ainey as follows:

"Recently this office has received reports of the shipment of anthracite of unmerchantable quality, largely composed of slate, bone, clinkers and other foreign matter, apparently made by irresponsible and unscrupulous people. Assuming the accuracy of these reports, such acts constitute not only a violation of the law but indicate a particularly heartless attitude on the part of the persons guilty of such violation in taking advantage of the public during the national emergency in fuel supply. Innocent consumers who are furnished worthless coal on orders placed in good faith may be subject to great physical suffering in addition to pecuniary loss in the inevitable delay involved in procuring a supply of domestic coal of proper quality to replace deliveries of worthless fuel.

"In view of the gravity of the offenses reported, I am sure that you will agree with me that everything possible should be done not only to punish those guilty of such acts, but also to forestall the possibility of a repetition by warning prospective purchasers of coal to take the proper steps to assure themselves of the responsibility and reputation of any concern offering coal for sale before purchasing."

Mr. Ainey replied as follows on Jan. 10:

"Numerous complaints have come to this commission with respect to coal being offered for sale and delivery, the quality of which is such as to make it objectionable and unmerchantable.

"In every instance thus far brought to my attention, the coal was sold by companies who are not operating and whose names do no appear upon our list of coal companies of Pennsylvania. In order that the public may be protected from making purchases from unreliable dealers or jobbers, it occurs to me that a warning may with propriety be given by the Fuel Administrators of the several states against making purchases from people or alleged coal companies without some investigation or inquiries through the State Fuel Commission as to the standing of these people.

"We have now located in the field inspectors from our Bureau of Mines to check up the quality of coal put out as loaded in the car, and are doing everything that we reasonably can to protect our sister states and ourselves from exploiters. It is difficult to check those who are taking advantage of the public's necessities in the way indicated, and while our efforts will not be relaxed they can be made more efficacious if greater care will be exercised on the part of the purchasers.

"P.S.—Above letter sent to all State Fuel Administrators."

The Pennsylvania Fuel Commission has requested the Attorney General of Pennsylvania to investigate the activities of these shippers of unmerchantable coal and to look into the legal aspects of the whole matter.

Would Exempt from Taxes Coal in Storage

A resolution was introduced in the House of Representatives last week by Representative Appleby, Republican, of New Jersey, requesting the several states to take appropriate action through their legislators to exempt from taxation all fuel of any kind and character in storage within the limits of those states.

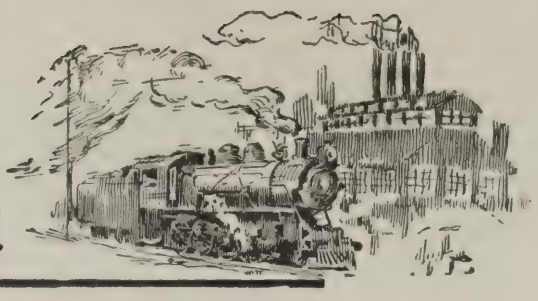
The resolution recites that "The fuel shortage in practically every section of the United States is becoming constantly more acute; conditions are such as to clearly indicate some practical steps must be taken toward the accumulation of reserves of fuel necessary to stabilize industry and protect the consumer in periods of acute shortages. It is evident that the seasonal demand for coal can, to a great extent, be met by storage at points near large centers of consumption. The practice of distributing agencies, railroad companies, corporations and individuals in storing large quantities of coal during the summer months in anticipation of future demand has practically been discontinued, largely because of the imposition of local taxes upon such storage stocks. The resumption of the practice of creating great storage piles of coal would establish valuable balance wheels to the trade and facilitate steadiness of operation of the mines, as well as assuring adequate sources of supply for seasonal demand."

Hazard Operators Hold Annual Convention

Although the all-day meeting was concluded with a big banquet in which everything was forgotten except fun, the 200 coal operators who attended the annual convention of the Hazard Coal Operators' Exchange at Lexington, Ky., on Friday, Jan. 12, spent most of their time discussing the extreme car shortage which has curtailed production in the Hazard field for many months.

Congestion of Louisville & Nashville cars at Covington and other Ohio River points has become so acute that the railroad is able to supply only 15 or 20 per cent of the demand and the mines are working only one or two days a week.

J. E. Johnson, of Lexington, was elected president and secretary of the organization, with J. T. Hatfield, of Cincinnati, vice-president and E. E. Bullock, treasurer.



The newly-chosen executive committee is as follows: Carol Robinson, Lexington; William J. Brown, Jr., Lexington; S. R. Jennings, Johnson City, Tenn.; J. H. Bowling, Lexington; Henry Pfenning, Lexington; James Bonneyman, Cincinnati; H. K. English, Lexington; Prentice Burlington, Cincinnati; W. E. Davis, Lexington; George W. Hay, Jenkins, Ky.; W. S. Dudley, Lexington; H. H. Heimer, Columbus, Ohio; A. L. Allais, Chicago, and G. P. Fitz, Hazard, Ky.

J. D. Haydon, superintendent of the eastern division of the Louisville & Nashville, was one of the principal speakers. On the program at the banquet were many prominent speakers and entertainers, including Governor Edwin P. Morrow, of Kentucky; Emery L. Frazier, Whitesburg, Ky.; Circuit Judge R. B. Roberts, Perry County; Prof. W. D. Funkhouser, of the University of Kentucky, and J. Edward Bassett, president of the Fayette National Bank, of Lexington.

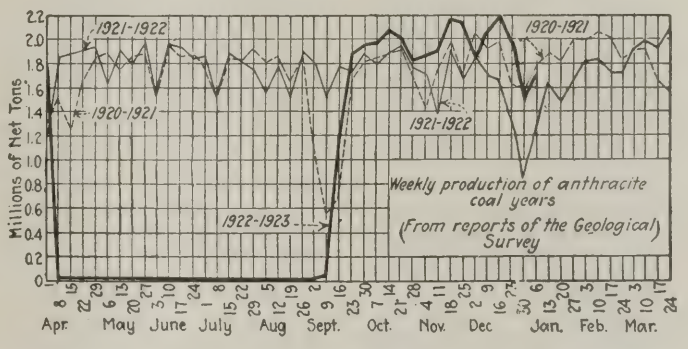
That a large amount of development in the Kentucky river valley coal lands is being held up pending the return of railroad service to normal was the opinion generally expressed at the convention. Operators contemplating extension of their projects and outsiders contemplating entering the Hazard field are naturally reluctant to go deeply into coal propositions while the car shortage is so acute.

Production and the Market

Weekly Review

Markets are feeling the full effect of the holiday idleness and consequent heavy resumption of mining. Railroads made the most of the operating lull to clear away their line congestion of loads. These cars, together with the heavy tonnage produced during the first week of the year, moved to destinations in better time than for months. The larger receipts quickly eased the market tension of the last few weeks and lower prices resulted. *Coal Age* Index of spot bituminous prices receded 10 points last week and stood at 365 on Jan. 15, with a corresponding average price at the mines of $4.42 as compared with $4.54 the preceding Monday.

The strongest feature is the domestic market. Retailers are re-ordering promptly but report that the consumer demand is for smaller lots than formerly. The Western demand for Southern fuels is unabated, but movement in that direction is slow. A stronger Tidewater call has also diverted more tonnage to Hampton Roads, where coastwise prices on spot business recorded a stiff advance last week.

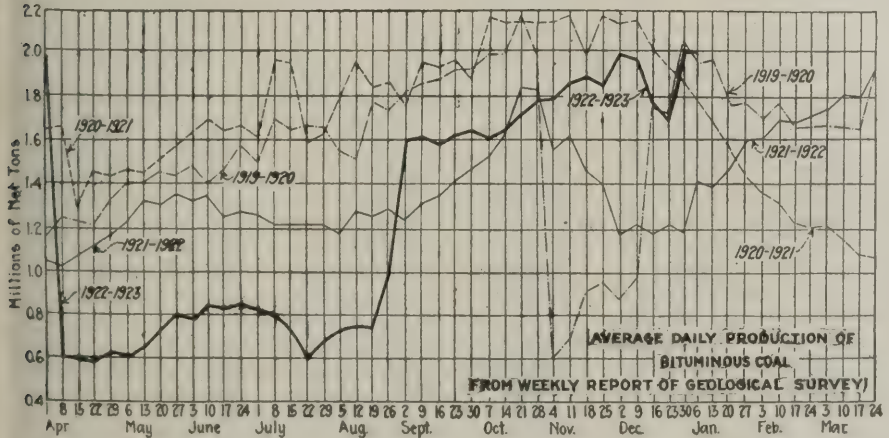


Demand Good But Not of High-Market Caliber

Demand continues fairly brisk but is not showing the tendency which makes for a high market. The better grades are still hard to obtain and are fairly firm in price. At the present rate of operations, railroads and contract users are taking so much of the total output that the volume of free tonnage is unusually small. Some anxiety is being shown over the labor situation. This is true among the large consumers in particular and with possible trouble less than 90 days off some of them admit they soon will have to change their buying policy to safeguard their operations.

American exporters are following with keen interest the developments of the French occupation of the Ruhr coal region in Germany. The possibility of a coal war between German producers and the French Government is absorbing their attention as it is realized that here may lie a temporary outlet for American coal. Should the price of German coal increase ever so slightly it will equal and even exceed the world price, which would release a flood of foreign coal into Hamburg.

Milder temperatures are the saving feature of the anthracite situation. With not enough coal to go around people manage to get along with the limited quantity available. The price list approved by the Pennsylvania Fuel Commission, which ranges up to $12, has caused some comment, especially as some quotations are heard at $13.25.



Shortage conditions are worse in New England and the Northwest than in other sections of the country. Only 69,000 tons of anthracite remains at the Head-of-

the-Lakes and this tonnage is all sold up. Blocking gales and snowstorms along the Atlantic Coast hinder the movement to New England and distributing companies are experiencing the worst delivery conditions in years.

The steam trade is now all that can be desired, as with so much buckwheat going into the retail trade, rice has come into strong demand, while barley has needed no urging at all for the past few weeks.

Blast furnaces are well supplied with Connellsville coke by contracts now running, most of them being for

(*a*) Subject to revision. (*b*) Revised from last report.

the quarter. Only occasional purchases of spot or prompt coke would be made, and the furnaces are quite indisposed to pay the current market price. Foundries are buying sparingly, but are taking somewhat more tonnage than in December. As to coke for domestic use, the heavy buying movement from the East subsided recently, but there is still scattered buying. Coke below furnace grade has been well cleaned up.

BITUMINOUS

"Revised estimates of soft coal output in the week of Jan. 1-6, 1923, show a total of 10,895,000 net tons," says the Geological Survey. "Production on New Year's Day amounted to little more than one-fourth of the average for recent normal Mondays. On the following day the output rose to a high level which was sustained throughout the week by reason of the opportunity which the holiday afforded the railroads for bettering the service. According to preliminary reports of cars loaded during the second week in January that week opened with a large production, 45,238 cars loaded on Monday, but there was a sharp decline thereafter to 34,206 cars on Tuesday and to 31,491 cars on Thursday. The total output for the week is expected to be between 11,000,000 and 11,250,000 tons.

"Preliminary estimates place the output of soft coal, including lignite and coal coked at the mines, during December at 46,450,000 net tons. This was the largest monthly record

since March, 1922, and, in fact, it has been exceeded but once since December, 1920.

"The test of the sufficiency of production to meet requirements is the state of consumers' stocks. On Oct. 1, there was in commercial storage approximately 28,000,000 net

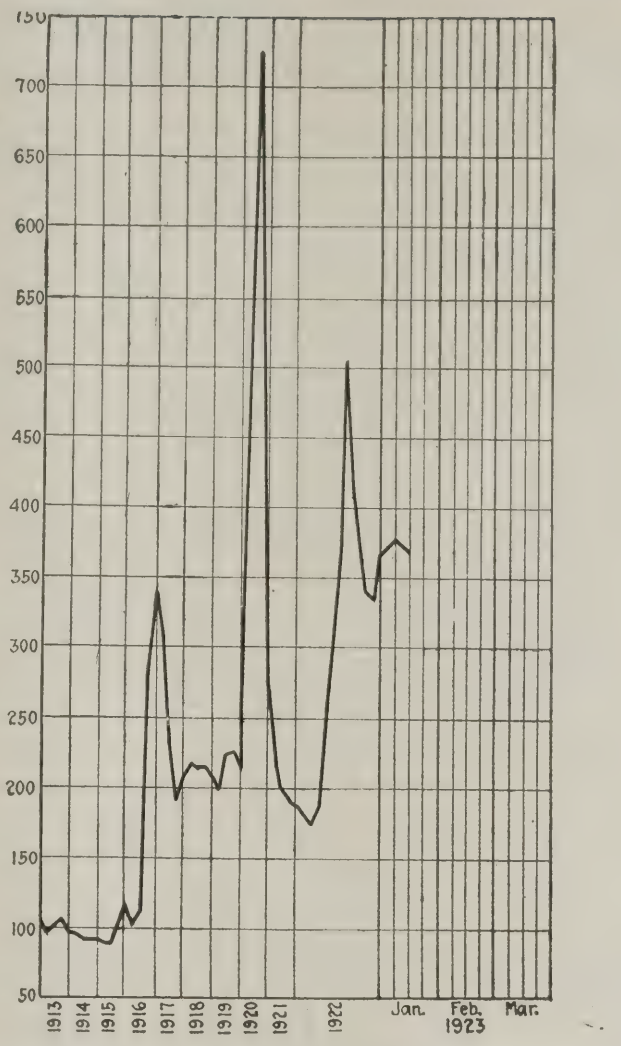
* Net tons, f.o.b. mines. † Advances over previous week shown in **heavy type**, declines in *italics*.

tons of soft coal. The available information indicates that the rate of consumption has increased since September, but has not yet equalled the rate of production. Consequently, coal has been flowing into storage, and stocks on Jan. 1, 1923, exceeded those in October. It is not yet clear how great the increase was, but further light will be shed on stocks and consumption after analysis has been made of reports now being received from consumers."

Coal trade in the Midwestern region is moving along at a fair clip in spite of warm winter weather and the general opinion that there will be no strike. No coal is soaring but most domestic is still in fair demand and steam is not exactly dragging. The last two days of last week saw a let-down, but sales managers for operating companies thought that was merely temporary and that this week conditions would strengthen slightly.

However, the keen demand for the best domestic grades at top prices has lost its edge and the lower-grade coals are getting a chance at the market at their lower prices. Dealers buy merely for their immediate trade, but this is enough to absorb a big volume of fuel. Big steam buyers have not stocked any to speak of. Most railroads are running along with much less than a week's supply on hand and practically every steam plant has wide empty spaces in its storage yard. Public utilities are so sure of an even and steady coal supply henceforth that none of them have stocked for more than 45 days. The average among them is said to be nearer 30 days, which is a low-water mark.

Car supply in several of the Midwestern fields has remained poor, thus cutting down to some extent the volume of southern Illinois and Indiana coals. Eastern Kentucky, on the other hand, has experienced a noticeable improvement and is now running along with a 40 per cent supply which means practically four days a week in that field since it is general practice there to over-rate mine capacities in determining car allotments.



Very little Eastern coal gets across Indiana to Western markets. This practical exclusion of Pocahontas together with the low volume of anthracite in the region, gives Western lump and egg the best chance they ever had at the domestic markets.

In southern Illinois fields most mines are averaging 2½ days a week. Steam demand there is heavy enough to absorb the whole output and domestic pretty well takes care of itself. There has been no change in association domestic prices which hold firm at $5.50 for lump while independents are getting as low as $4 for lump, egg and nut. Screenings range $2.75@$3.

Western Kentucky, with a car supply averaging around 20 per cent on the L. & N. and about 47 per cent on the I. C., is moving out a good deal of coal toward the South. Prepared is in fair demand because of a little cold weather coming along just when dealers' stocks were low. Screenings are holding steadily above $2 and up to $2.50. The best lump from this field is bringing up to but not exceeding $4.50. Eastern Kentucky, with a steady byproduct demand to fill, is making good use of a fair car supply, getting $6.50@$7 for block, $6@$6.50 for lump, $3.25@$3.50 for steam mine run and 50c. more for gas mine run, and $3@$3.50 for screenings.

During the week the Northwest felt a slight firming up of the market for most soft coal because of the general feeling of tremulousness with which the countryside watches the dock stocks melting down. It is assured there will be no carry-over worthy of the name this year. Bituminous coal is bringing higher prices. Lump is up to $9.50, run of pile has jumped from $8 to $8.50@$8.75 and screenings have ascended from $6 to $6.25@$6.75. Northwestern dealers could sell all the Pocahontas they could get—if they could get any—but the supply is even shorter than the supply of anthracite. In Milwaukee Pocahontas mine run sells for $12.50 and screenings are hard to get at $11. In Wisconsin the state fuel commission eyes all sorts of domestic coal with interest because it says the state needs 175 cars of anthracite at once to protect against suffering in case of a severe cold spell.

In direct variance to the liveliness of the Northwest, coal markets in the West and Southwest are distinctly slower.

Coal Age Index 365, Week of Jan. 15, 1923. Average spot price for same period, $4.42. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913,1918," published by the Geological Survey and the War Industries Board.

How the Coal Fields Are Working

Percentages of full-time operation of bituminous coal mines, by fields, as reported by the U. S. Geological Survey in Table V of the Weekly Report.

	Six Months July to Dec. 1921	Jan. 1 to Apr. 1, 1922 Inclusive	Sept. 5 to Dec. 30, 1922 Inclusive	Week Ended Dec. 30, 1922

* Rail and river mines combined.
† Rail mines.
(a) No report.

Mild weather throughout the plains and Rocky Mountain states has cut down demand and fairly regular car supply in the mountains have combined to force prices down materially.

The Kansas, Oklahoma and Arkansas fields, flooded with fairly cheap oil and attacked on the west by non-union Colorado are feeling the pressure right now as keenly as they ever have. A poor car supply is not such a saving grace, either, for it prevents operators from holding such markets as they have been feeding all winter. Some choice Oklahoma coals have been shipped all the way to Chicago.

There has been a lull in the spot market in New England. Receipts have not been large enough to induce any lowering of prices, but there have been fewer buyers in the market willing to take coal at present figures. A little lack of faith in the spot market 60 days hence is also shown by operators who are willing now to make contracts to Jan. 1, 1924, on a basis much lower than the same coals would command at this time. Consumers are inclined to hold off, preferring to rely upon their present stocks until they can get a better line on the developments the remainder of the winter. In consequence there is just enough demand to absorb what tonnage offers.

Pocahontas and New River are being firmly held. Output is still on less than a 50 per cent basis, and the Western demand for prepared sizes is still sufficient to withhold coal from Hampton Roads except on contracts and for remunerative spot prices. Hampton Roads dumpings were 280,060 net tons during the week ended Jan. 11, as compared with 231,386 tons in the preceding week. The all-rail movement to New England was 3,115 cars during the first week of January, as compared with 2,696 cars during the previous week.

The North Atlantic market has developed a decidedly easier tone. There is a further easing off of quotations. Demand is slow in New York and the number of cars at the local terminals increased last week to over 4,000. Much of this was due to the embargo placed on shipments to New England and to orders placed for shipments a few weeks ago when quotations were 50c.@$1 higher. The break in the market, to some extent, is reflected in the fact that there is now a difference in Baltimore quotations on some of the coals running to such pools as 9 and 10, with the price paid for Pennsylvania line fuels 25c.@50c. higher than for B. & O. and Western Maryland coal. Gas coals showed considerable weakness last week and the drop in price was more marked than for steam fuels.

ANTHRACITE

Production of hard coal was 1,725,000 net tons during the first week of 1923, as compared with 1,560,000 tons during the preceding week. Shippers and distributors agree that the milder weather of late has been the saving feature, as the supply is still inadequate. New England received 3,627 cars during the week ended Jan. 6, a marked increase when compared with 3,166 cars in the preceding week.

COKE

Production of beehive coke recovered quickly from the holiday slump. The output during the week ended Jan. 6 was 308,000 net tons as compared with 263,000 in the preceding week. Connellsville production continued to improve, despite the lessened demand for coke for domestic purposes.

Foreign Market And Export News

German Troubles Aid British Coal

Christmas holidays dropped British weekly production below the 5,000,000-ton mark for the first time since early in September. The output for the week ended Dec. 30, was 3,428,000 gross tons, according to a cable to *Coal Age*. Demand for coal is active, however, and prices are strong.

The United States has open orders for January and February loadings of around 250,000 tons and further large commitments are expected from Canada. The Brazilian Railways recently contracted for 150,000 tons, delivery in six months, and the Continental demand is strong. French occupation of the Ruhr has produced heavy orders for Germany. The holiday mine idleness has given an opportunity for shippers to clear away much of the congestion on wheels and at the piers.

Brisk Trading at Hampton Roads

The situation at Hampton Roads showed considerable improvement last week, with supplies of coal on the increase and a somewhat better outlook in the car situation. Demand was brisk but shippers were unable to meet all spot requirements as so much tonnage is rolling westward.

Stronger demand gave the market a decidedly firmer tone throughout. The bulk of the movement was coastwise, increased demands from the North having stimulated trade.

Car shortage was still pronounced, but not on the plane that had obtained for the previous six weeks or two months.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, THURSDAY, JANUARY 25, 1923 Number 4

An Endurance Test in the Ruhr

EVERY eye is now on the Ruhr. Can the horse be made to drink, now that he has been led to water? The French have the coal fields under their control, but can they mine and transport the coal? It was generally agreed in this country last summer that soldiers do not make good coal miners.

In Europe Coal—coking coal—is King. Coal has become the real basis of the German currency, the shortage of fuel in that country has become a chief source of trouble and the centralization of its control the chief source of wealth of great industrialists, like Stinnes. Germany, from having an exportable surplus of coal as before the war of some 25,000,000 tons, now stands in need of net imports of nearly a like amount. The loss of the Saar and the partition of Upper Silesia, whereby about three-quarters of the coal and half the coke went to Poland, left Germany little but the Ruhr and the brown-coal mines.

Of a total of around 100,000,000 tons of Ruhr annual output France wants and needs some 15,000,000 tons and Germany the remainder. The steel industries of both countries depend on this supply. The present contest will test the resistance of both France and Germany to a coal shortage that by the very nature of the case will be much the more serious to the east of the Rhine.

"Not Guilty"

TWO words from a jury in "bloody" Williamson County, Illinois, have brought happiness to various officers of the United Mine Workers of America and unutterable relief to scores of union miners in southern Illinois. That is the best that can be said of the verdict returned Jan. 19 in Judge Hartwell's court at Marion, Ill., where were tried the first five of 77 men indicted for slaughtering 21 non-union strip miners and guards June 22 at Herrin. Surely that same happiness cannot be felt by all officers of the United Mine Workers of America, for there are a host of sane and law-abiding men among them. Surely that same unspeakable relief is not felt by all union miners in southern Illinois, for there must be good American citizens in that solidly unionized region. Thousands of them had no part whatever in wantonly butchering the surrendered strip miners. Among those thousands surely there are men who rue Jan. 19 as a day when mob violence definitely enthroned itself as ruler of Williamson County.

A good case was built up by state and federal investigators and attorneys in the face of every obstacle that public sentiment and organized action in Williamson County could lay. A fair presentation of that case before the jury was made. The defence devoted most of its efforts merely to impeachment of the state's evidence so that by the time the case was given to the jury it was a matter of one man's word against another's—the word of a free-talking, nothing-to-fear witness on the popular side of the miners' union against the word of an eye-witness who talked in fear of his life yet testified damningly and swore it was the truth. The jury took the word of the free talker, and the United Mine Workers won the case.

It would have been unhealthy at least for the "twelve good men and true" to bring in any other kind of a verdict. Now that the verdict is in, thus setting the pace for the massacre trials to ensue, what of the victory of the United Mine Workers of America? Their attorneys exultantly greeted the end of the case with a statement that the verdict made them "happy because this may, and ought to be, the birth of a new era in industrial disputes in America"! If it is, then by this bloody perversion, murder and physical torture are set up by the United Mine Workers of America as legitimate weapons in industrial disputes. What an era these spokesmen for the union desire!

The Coal Commission's Report

IN ITS effort to be absolutely fair and to avoid placing responsibility before the blame is proven, the President's Coal Commission has brought out a report which is certain to be a disappointment to the consumers of coal and to many members of Congress. In the coal trade itself there is an evident sense of relief. In the average investigation of this kind it is customary to have some harsh things to say to operators, wholesalers and retailers, even before it has been established that they are guilty.

The Jan. 15 report has all the indications of a desire to avoid expressing conclusions until all the facts can be weighed. As a consequence, it may be predicted that the smaller consumers and a certain element in Congress will feel that the report is colorless and that the commission is not reaching the seat of the trouble. It does not express an opinion as to whether or not current prices are just. It does not say whether or not the miners are receiving a higher rate of wage than the consumers should be called upon to pay. No one is accused of profiteering. The report indicates in a general way something as to the spread between the cost at the mine and the delivery cost of coal, but it gives no clue as to who is responsible. Labor, transportation, overdevelopment, storage and other matters are discussed, but little is said about the business factors in coal. For that reason it is certain that some of the gentlemen on Capitol Hill will conclude that the commission has written "Hamlet" with Hamlet left out.

The more constructive thinkers both within and without the industry seem to be agreed that the commission did well in making haste slowly. Even those who are expressing much disappointment with the report are

inclined to suspend final judgment as to the possibility of the commission bringing out something concrete at a later date.

A careful analysis of the report shows that there is little material in it which could not have been written on the first day that the commission sat. Nevertheless the presentation of this material is regarded as being valuable because the wide publicity will contribute greatly to the popular understanding of the entire subject. The report must be regarded more as a statement of the problems of the commission than as a contribution to their solution. Not one shred of new statistical information is contained in the document. From a constructive point of view this failure is regarded by some as the most serious because the report as it stands holds out no assistance to the New York conference. A significant feature of the report is the indication that the commission is not inclined to allow the industry to blame all of its ills on transportation.

"Changing a Dollar Into Four Quarters"

THE epidemic of stock dividends which broke out so virulently during the closing months of the old year continues to excite much public discussion. Opinions continue to differ widely as to their purpose and effect. In view of the leading part played by the Standard Oil group in the distribution of such dividends particular interest attaches to the vigorous defense of the policy advanced by A. C. Bedford in his address before the American Petroleum Institute, now available in the form of an attractive brochure.

Mr. Bedford flatly denies that stock dividends result in any tax evasion. Further, he makes a strong plea for the essential soundness of the process of building up a surplus from current earnings, putting it back in the business and capitalizing it through the issuance of new shares to old stockholders. The issuance of the stock dividend, he insists, means merely "changing a dollar into four quarters." It creates no new wealth.

Economists and accountants generally will agree with Mr. Bedford in his contention that the simple act of declaring a stock dividend creates no new wealth. They also will agree that the increase of the capital fund is essential to the progress of business and the country generally. Finally, they will admit that the stock dividend does not offer a method of tax evasion in any legal sense.

However, having conceded all of these points, an honest, inquiring mind may still hunger for a deeper analysis than Mr. Bedford has made. Is there nothing more than this to the stock-dividend epidemic? Is there no rational explanation for the conviction so generally prevalent that the stock dividend is significant of some condition which needs correction?

Mr. Bedford apparently accepts the orthodox definitions of wealth and income, for he argues that the stock dividend is not income because it creates no "new wealth." One has income when his wealth—his economic strength, in the sense of command over goods and services—has increased. This is the general conception of income which underlies our federal income-tax law. With this definition in mind, let us raise a few queries which may serve to clarify the issues.

Suppose I invest 25c. in the Standard Oil Co. of New Jersey. Suppose the company prospers and builds up a large surplus, my share of which amounts to the value of 75c., so that my interest in the company is now worth a dollar. Suppose the company declares a stock dividend "changing the dollar into four quarters." Has anything of significance happened? Has my economic strength increased? Have I really received any income?

Clearly the stock dividend simply recognizes an existing situation. It recognizes that the quarter has expanded into a dollar and makes the convenient "change." But the significant thing is that I am ahead to the extent of 75c. in value—not merely because of the stock dividend but as the result of the whole process. At the beginning I had a quarter invested in productive enterprise. Now I have an investment worth, by assumption, a dollar.

The real nub of the matter from the tax point of view is this: the process described in the above example is about the only way I can make 75c. and reinvest it in productive enterprise without subjecting the three new quarters to the heavy surtaxes of the federal income tax. The corporation pays the normal tax—slightly higher, it is true, than the individual normal rate—when it adds the new quarters to surplus, but I am asked to account for them only *if* and *when* the corporation distributes them to use as a cash dividend or *if* and *when* I sell my stock at the enhanced value due to the surplus which has been built up. This "if and when" is of considerable importance.

If I had invested my original quarter in an equally prosperous individual enterprise or partnership I should have been asked not only to pay the normal tax as the new quarters were earned and reinvested but in addition I should have been compelled to pay the surtaxes on them *when earned* rather than *"if* and *when"* distributed or *"if* and *when"* I sold the stock at an advance.

Clearly the corporate form of business organization has an advantage under the tax law because of this situation and the stock dividends are advertising this advantage in a most striking manner. It is this advantage which is really the shining mark at which the "agitators" are aiming. Is it not an advantage which must in some manner be equalized if the "sturdy qualities" of individual initiative and resourcefulness, which Mr. Bedford so properly praises, are to be given full play?

How to accomplish this is, indeed, perhaps the most puzzling tax problem which the federal government is facing. It cannot be solved by refusing to recognize its existence or by approaching it from the point of view of one industry, one form of business organization, or one economic class. The differential in favor of the corporation may conceivably be removed by increasing the burden on the corporations or by decreasing the burden on the other forms of business enterprise.

The "agitators" suggest a new tax on the undistributed surplus of corporations as closely equivalent as possible to the present surtax burden on reinvested earnings of other forms of business enterprise, a suggestion which Mr. Bedford labels "a proposal of sabotage by legislation." The fear of such a tax probably is a contributing cause although not the sole or perhaps not the most important cause of the stock-dividend epidemic. The alternative plan for eliminating the corporations differential would be to reduce the present burden upon reinvested profits of partnerships and individuals. But he who proposes this must be prepared to convince the public that a dollar of wages should be more heavily taxed than the dollar of reinvested profit. This is the dilemma!

Surface and Underground Methods at Blue Diamond Mine; Modification of Elkhorn System of Mining Used

Lengthy Hillside-Scraper Conveyors—Hoist Hauls Supplies Up Two Hills and Places and Retracks Cars at Tipple—Wide and Narrow Rooms Alternate—Pillaring System Can Be Adapted to Roof Encountered

By Alphonse F. Brosky*
Pittsburgh, Pa.

FOUR miles northwest of Hazard, Ky., as the bird flies, and twice that distance by rail, on First Creek, off the North Fork, lies the town of Blue Diamond and the mine of the same name, which are the property of the Blue Diamond Coal Co.

In the Hazard field, of only one tipple can it be said that it is constructed entirely of steel, and that one is at the Blue Diamond Mine. The reason why steel tipples are not to be found doubtless is because of the difficulties of transportation. A steel tipple complete seldom costs more than 20 per cent more than a wooden tipple of similar proportion and design. The fire hazard, which is unusually severe in places such as Hazard, where little water is to be had in the dry seasons and where forest fires are common, would warrant the additional investment that the steel tipple entails. Few of the tipples in eastern Kentucky, even though of wood and of recent construction, have adequate fire protection. One properly provided with a fire line will be described in a later issue.

The Blue Diamond tipple is designed to size 300 tons of coal per hour into slack, nut, egg and lump, or any combination of the first three or run of mine. The mine can load about 3,000 tons daily and this is the capacity of the tipple. The Hazard No. 6 seam varies in thickness from 6 to 7 ft. It has two partings, neither of which, however, persists throughout the field; first one and then the other runs out. The Blue Diamond acreage is comparatively free of either parting. A representative analysis of the coal shows 1.96 per cent moisture, 37.16 per cent volatile matter, 56.32 per cent fixed carbon, 4.60 per cent ash and 0.56 per cent sulphur. Its heat value is 13,800 B.t.u.

The coal lies about 200 ft. above the railroad in two main hills which flank the spur track and in the hills adjoining, the holding measuring 4,000 acres. Coal is dropped to the tipple from the two sides by means of scraper-conveyors, one of which is 410 ft. long. For part of its length it is on a 26-deg. slope. The other is 210 ft. long, the slope being 23 deg. The company officials favor the scraper-conveyor, believing that the rope-and-button conveyor, though a satisfactory lowering medium, does not have the needed capacity. They prefer the conveyor to monitors, gravity planes and chutes.

At No. 2 headhouse the mine cars in twos are dumped, still coupled to the trip. For this purpose, a two-car rotary dump is used, the coal dropping into a 50-ton bin. A reciprocating feeder feeds it to the scraper-conveyor which carries it to the tipple. At Headhouse No. 1 the same arrangement has been made

*Assistant editor, *Coal Age*, Pittsburgh.

Note—The headpiece shows the tipple at Blue Diamond Mine, Blue Diamond, Ky. On the left may be seen the shed of the scraper-conveyor by which the coal is lowered down the hill on that side. Coal is brought to the horizontal shed on the right by a scraper-conveyor housed and supported in a similar manner. Scaffolding has been erected for the purpose of adding another lump picking table. The small shed that appears to be directly under the scaffold, but is really behind it, houses the hoist by which supplies are pulled up the hill and railroad cars are placed and retracked.

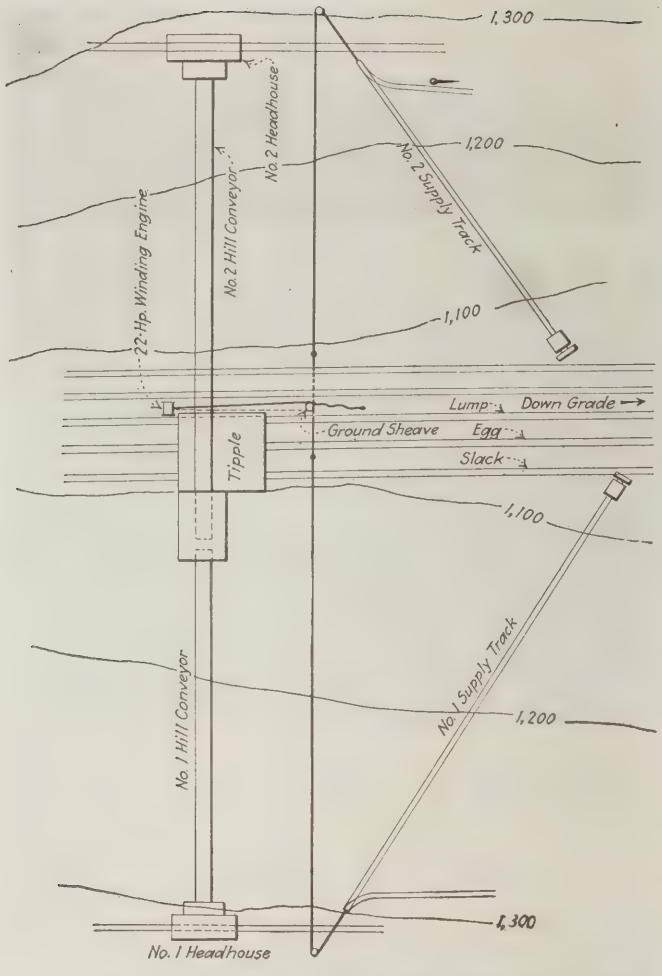

FIG. 1—HOW ONE HOIST PERFORMS THREE DUTIES

Schematic plan showing the electric hoist near the tipple of the Blue Diamond Mine and the connections which make it possible to use it for hauling railroad empties, loads and supply cars on the railroad tracks and to hoist mine cars filled with supplies on the two inclines which scale the steep hillsides.

except that only one car is dumped at a time. The arrangement of the tipple has no unusual features.

The coal from the two conveyors falls into a common bin and becomes merged. Thence it is fed to the shaker screens. The slack removed in the second cleaning which is made over the egg screens is carried to a slack bin by an unusual method of conveyance, namely, a worm conveyor. The original tipple had but one lump picking table. An additional lump table has been installed in an annex to the tipple, so that part of the lump coal will go over the old and part over the new table. After passing over the new table for picking purposes only, it will pass back to the end of the old table at the head of the loading boom over the lump track.

An extremely interesting and practical hoisting arrangement is used on the tracks of the Blue Diamond plant. A 22-hp. electric winding engine with a single cylindrical drum 2x2½ ft. is placed at the upper end of the tipple between No. 3 and No. 4 tracks. A close inspection of the headpiece will show the shed in which this engine is housed and its position relative to the tipple and tracks. About the drum is wound approximately 1,500 ft. of ¾-in. steel-stranded cable at the end of which is a clevis block.

This rope is used for various purposes about the tipple tracks such as bringing up supplies in freight cars from the siding, hauling back coal cars that might by chance get away from the tipple, pulling back on the track derailed railroad cars and performing like services. In a way it performs many of those duties about the tipple that usually are performed by that class of steam locomotive known as a "shifter."

Located directly in front of the winding engine and below the tipple is secured a horizontal ground sheave about which the hoist cable may be made to pass. This is used to turn the rope either to the right or left.

A supply track on each hill raises all materials to the level of the coal. Ropes similar to the main rope pass up the respective hills over sheaves and pulley blocks and down the supply tracks. The end of the main rope may be attached by a clevis coupling to either of the free ends of the two supply-track ropes. This gives the hoist duty in three different directions, straight ahead for railroad work or to the right or left when used on one or the other of the two supply tracks on the hills. Fig. 1 is a schematic sketch of the plan.

Cleavage Planes in Coal Not Pronounced

The cleavage of the coal is not pronounced, so it matters little whether the rooms are driven "face on," "end on" or in any of the intermediate directions. As the shape of the coal area is not regular the rooms cannot be driven in the same direction everywhere throughout the mine. The main entries under the several hills are driven in a manner to obtain the most economical haulage and mining, sometimes askew to each other, depending upon the lateral axis of the several hills. Rooms are driven parallel to these. The varying direction of the room owing to the mining of irregular bodies of coal makes it difficult for those superintending the work to obtain large recoveries. Conditions in this field differ from those in the deeper seams of other states, for there mining may be performed more systematically.

As has been said already, the rooms usually are driven parallel with the main entries, developing a true room-and-pillar system, with only one pair of main entries and with stub butt headings on either side. Those who followed the description of the mining methods of the Columbus Mining Co. in the Hazard No. 4 seam which appeared in the issue of *Coal Age* of Nov. 11 will remember that in that mine the panel system has been adopted. Both companies use the modified Elkhorn system of mining. In the Blue Diamond Mine the four mains are driven on 62-ft. centers, 12 ft. wide,

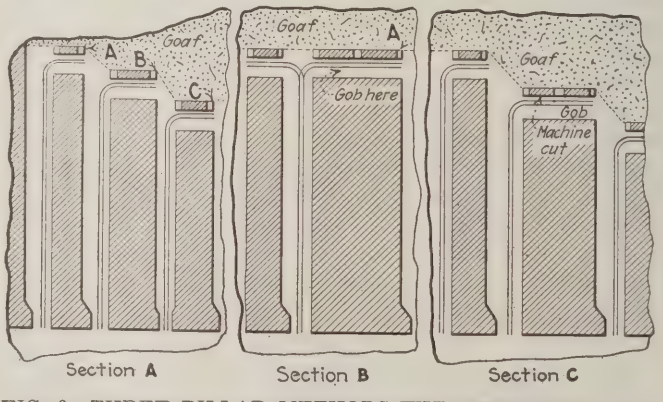

FIG. 2—THREE PILLAR METHODS WITH ELKHORN PLAN

If the wide pillar cannot be mined from the wide rooms on either side of it, because the large open areas would make such work dangerous, then the pillar may be split in two by a narrower room and each pillar worked independently as illustrated in the left panel. Sometimes it is found advisable to bring both the wide and the narrow pillar back from the same room as in the center panel. On the right is shown still another way to mine these pillars. Most of the pillar coal is cut by machine.

giving a 50-ft. chain pillar. Further protection is afforded by 100-ft. barrier pillars. The butt entries are driven every 404 ft. on 52-ft. centers, thus providing a chain pillar 40 ft. in width.

The rooms are driven 200 ft. long and in both directions. It will be recalled that the Columbus Mining Co. has gone even further and makes its rooms only 175 ft. long. By employing the 200-ft. room this company indicates that it is its belief also that the short room is preferable. In the past the Blue Diamond Coal Co. made its rooms 250 ft. long, but it has found that the present 200-ft. room has its advantages. Briefly, its merits are: That room track is tied up for a shorter period of time; that a room with bad roof is speedily driven up and the pillars withdrawn; that the pillaring is completed more quickly and that gathering locomotives and undercutting machines can be operated with less cable.

The rooms are 20 ft. wide, the neck being only 12 ft. long. The rooms are driven alternately on 45-ft. and 85-ft. centers, leaving alternately a 25-ft. and a 65-ft. pillar. This sequence is maintained from the

FIG. 3—ROOM BEING DRIVEN INTO SOLID COAL

Rooms are driven 20 ft. wide and necked when 12 ft. from the heading. Timbers are carried on a line that affords just enough clearance for safety. The room as shown has not been cleaned ready for the next cut.

main entries to the crop. The rooms are driven to meet each other, and the pillars are brought back immediately, providing drainage is not hampered thereby.

The wide pillar lying between two sets of two rooms on 85-ft. centers comes in handy where bad roof conditions prevail, for it assures adequate support of the cover. It also gives a broad choice as to the manner in which the pillar may be drawn, depending upon the roof conditions at that particular point.

Fig. 2 indicates three distinct methods of mining out a wide pillar and a narrow pillar adjacent to it. Thus if the roof will not permit of taking the pillar off the end "long face," as it is termed, then the pillar may be split from end to end by a 12-ft. room driven through the center of it. The two smaller pillars are then worked independently of each other, as indicated in section A, Fig. 2.

In other places only a portion of the pillar will be split, say from the last crosscut forward, in the hope that when the retreat reaches the unsplit pillar that pillar may be worked across its entire width. Although it is not customary in this system to bring back two pillars from one room, this is being done in a few places in the mine, and with satisfactory results. Where the roof refuses to break close up to the pillar and extends like a cantilever into the goaf, the weight is likely to be concentrated on one corner of the pillar

FIG. 4—ROAD DRIVEN THROUGH COAL PILLAR

A 12-ft. roadway is driven through the end of the pillar, leaving a pillar 6 ft. wide which can be penetrated by a mining machine. Two cuts are made in the pillar, leaving three small stumps 6 ft. square—one at each end and one in the middle. These are drawn by the use of the hand pick.

as at *A* in section *B* of Fig. 2, and this corner is likely to give way under the strain.

But if the roof breaks readily then the wide and narrow pillar may be brought back together, the wide step in the pillar front in that case not being undesirable; otherwise it might be advisable to bring the pillars back out of line so that the steps on the pillar front will be many and easy, as in section *A*. With this arrangement three bearing corners would support the weight of the hanging roof as at *A*, *B* and *C* in section *A*. Bringing the pillars back as in section *C* is yet another way. It must be understood that only in places would the roof fail to break off close to the coal in the manner just mentioned. Roof thus obstinate is not commonly found; if it were it would indicate that the rooms were not being properly laid out, and a dangerous squeeze would follow.

Mining Usually Governed by Bad Spots

However, even in the best regulated systems, careful as we may be, there are spots in any mine where the roof does not break down as well as at other places. It is these few spots, though they are in the minority, that govern the mining throughout the mine. Right here is where the wide pillar offers an alternative: It may be mined unsplit, thus producing a larger tonnage per working place, or else it may be split in two, giving two pillars of the usual width. If conditions favor working a wide pillar, then work it as such; if not, then split it. Certainly the wide pillar reduces track costs in the pillar section and, incidentally, the daily mileage of a gathering motor in any given area.

When a wide pillar is butted off, a place 12 ft. wide is cut through the rib, leaving a wing 6 ft. wide to be taken out in coming back. The cutter bar of the machine can cut through this. The track usually is laid close to the wing to facilitate cutting and loading and to provide a space for the gob between the track and the solid pillar of coal behind it. The wing is loaded out in two cuts, leaving two end stumps and a center sprag, which later are extracted by hand picks.

The mine village is second to none in the Hazard field. Its plan is peculiar in that the dwellings are scattered and stretch over a considerable distance. The little bottom land available is occupied by a few houses, but the preference seems to be to locate the dwellings, as far as may be, on the hillsides. The main part of the town is its upper end. Below, and extending for nearly one-half mile down First Creek, the lines of houses branch out as tentacles on both sides up the

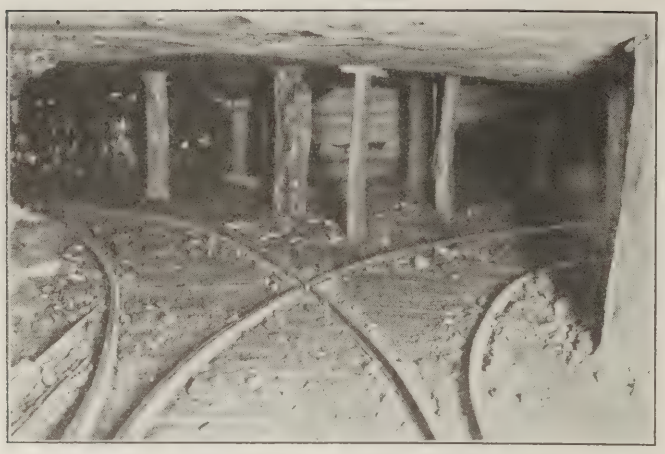

FIG. 5—WHERE PILLARS ARE DRAWN AS IN SECTION *B*
On the right the pillar is 65 ft. wide and on the left only 25 ft., both pillars being drawn simultaneously. The fallen goaf can be seen at the end of the road. A goodly portion of the coal in the pillars can be saved with this method of operation.

several hollows that enter the main valley in that distance. Sometimes they are placed in a single row not far from the bottom but often they are arranged in double rows, the last at a considerable distance up the hillside. The extended house line is quite long. It must be at least three miles in length.

The inhabitants of the town are provided with good drinking water. The company removes garbage and rubbish twice each week and every means possible is utilized to maintain the community in good health. The usual care has been taken to provide the people with recreative amusements.

The town has a beauty spot which abounds in such evergreen shrubs and trees as holly, pines and rhododendrons. Many of these have been set out by the company. Walks with concrete steps and a rustic bridge give the inclosure the appearance of a country estate. Within its bounds are some thirty dwellings for single families. I mention these things to set aright those readers who are of the opinion that the owners of isolated camps in far-away places never show any appreciation of beauty or of the possibilities of landscape gardening.

The Blue Diamond officials instead of planning a bad imitation of a small city—a treeless waste with all manner of disarray—have sought to maintain the beauties of the Kentucky mountain region.

FIG. 6—VILLAGE SCENE IN BLUE DIAMOND
The mining company has hesitated to improve overmuch on nature. The average mining town is started by destroying everything that could render the town beautiful. The Blue Diamond Coal Co. has spared the trees but cleaned up the underbrush and logs and removed the rotten timber, so as to eliminate the fire and accident hazard, giving the town a beauty that uniformity could not afford. The houses are well spaced so as to leave the landscape but little spoiled by human intrusion.

Chromium-Iron Alloy Resists Oxidation, Corrosion, Abrasion and Heat

ONE of the main troubles in mining work is the rapid corrosion of all metals exposed to the acid action of mine water. It has been found that alloys can be made that resist oxidation, corrosion and abrasion with eminently satisfactory results, but in most cases these alloys are extremely expensive and do not adapt themselves with any degree of flexibility to the varying needs of the industry. Some can be cast but not rolled. Many cannot be drilled, bent or punched.

Certain chromium-iron alloys, known as Duraloy, are manufactured by the Cutler Steel Co., of Pittsburgh. They may be obtained either cast or rolled. The proportions of the constituent metals are varied so as to resist oxidation alone, or corrosion and oxidation combined or abrasion, corrosion and oxidation—all three. Bars or sheets of the metal can be made sufficiently ductile to permit of bending, punching, forming and stamping. They are afterward treated to increase their hardness and wearing qualities. Such metal can be made into wires or tubing.

The alloy has an ultimate tensile strength of 40,000 to 90,000 lb. per square inch, an elastic limit of 30,000 to 80,000 lb. and an elongation of from 2 per cent to nothing. The rolled or forged alloy has a tensile strength of 80,000 to 130,000 lb. per square inch, an elastic limit of 65,000 to 110,000 lb. and an elongation from 26 to 8 per cent.

Can Be Tapped, Threaded and Drilled

Some of the rolled or forged alloys can be machined as easily as medium-carbon steel, and some of the castings can be tapped, threaded and drilled, but if hardness is sought the alloy can be furnished at 600 Brinell, in which condition, it is, of course, possible to finish it only by grinding.

The strength is well maintained under heat. At a temperature of 932 deg. F. it is still 98,000 lb. per square inch, and at 1,832 deg. F., no less than 10,000 lb. The alloy may be welded by either oxyacetylene or electric-arc methods, using a welding rod of the alloy where two pieces of the metal are to be joined or a standard welding rod where the alloy has to be welded to some other metal. Preheating is desirable but not essential. The metal is readily cut by the oxyacetylene cutting torch, for it does not oxidize.

Its weight loss to corrosion after two hours was zero, that of nickel was 0.01 per cent; that of an alloy of nickel and copper, 3.81 per cent; that of cast steel, 5.39 per cent; that of cast iron, 5.57 per cent, and that of steel 6.80 per cent. In the same corrosive liquid the weight loss of Duraloy in 300 hours was 0.01 per cent.

J. W. Paul, coal-mining engineer, of the U. S. Bureau of Mines, has made a study of the barricades constructed by entombed miners in the recent Argonaut mine disaster in California. A miners' circular on the use of barricades following explosions and fires in mines will be issued at a later date by the bureau.

Additional local chapters of the Joseph A. Holmes Safety Association have been formed at Brewster, Fla.; Bay City, Mich.; Cuylerville, N. Y., and at Newcastle, Wash. On Nov. 1 there were 27 chapters located in 12 states, representing the coal, gold, lead, copper and phosphate mining and petroleum refining industries.

Grudekoks

By O. P. Hood*
Washington, D. C.

WHEN a new material is put on the market a name must be found which is either descriptive of the material or warranted to attract attention. A new member of the family of fuels in Germany carries the name of "grudekoks," which means "embers coke." In our own country we have been hunting for a suitable name for the material that remains after lignite is subjected to a heating process by which most of the moisture and volatile matter is driven off. The term "lignite coke" suggests itself, but this is a little misleading, as the material does not look like the familiar coke as made from bituminous coal. The term "lignite char" is perhaps a little more descriptive, and this may be taken as the American equivalent of the German grudekoks.

In attempting to improve lignite as a fuel it is desirable that the large quantity of water—from 25 per cent to 40 per cent—be driven off in order to concentrate the fuel values sufficiently to warrant distant transportation and to make a stable product. With the water removed the ash remains and about equal parts of volatile matter and fixed carbon. The volatile matter may be more valuable as a source of byproducts than as a raw fuel, and, furthermore, when it is partly removed the resulting char is mechanically stronger than the lignite from which it is made. The following analysis of lignite char is perhaps typical:

Constituents	Per Cent
Moisture	2
Volatile matter	12
Fixed carbon	72
Ash	14

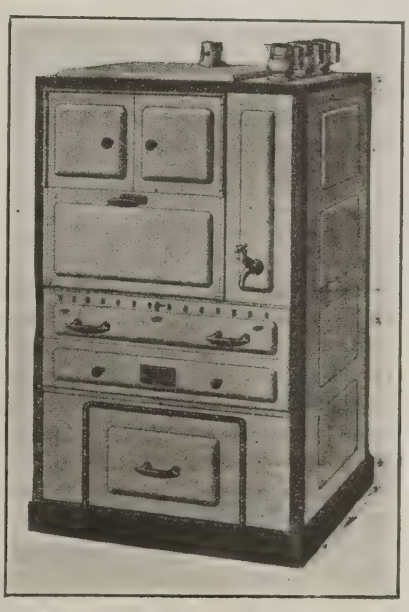
A semi-anthracite from Pennsylvania analyzes as follows:

Constituents	Per Cent
Moisture	3.4
Volatile matter	8.5
Fixed carbon	76.6
Ash	11.5

A sample of buckwheat No. 2 anthracite analyzed:

Constituents	Per Cent
Moisture	6.2
Volatile matter	5.6
Fixed carbon	71.5
Ash	17.5

The similarity between these products is striking, and it can be said that lignite char can be made that has an analysis quite comparable with anthracite. Physically, however, it is quite different. In expelling the moisture from lignite the material breaks up into small pieces of a size about like corn, wheat and broken rice kernels, with some of it even finer. A screen test of this material made from North Dakota lignite last summer is as follows:



Sizes	Per Cent
Over ½-in. round-hole screen	6
Over ¼-in. through ½-in. screen	19
Over ⅛-in. through ¼-in. screen	35
Through ⅛-in. screen	40

The material is gray black, and if "hard burned" has a slightly metallic ring or rustle as one pours the grains from hand to hand. The characteristic piece has rectangular faces like a miniature brick; the cleavage is therefore unlike anthracite, which is conchoidal. The material is clean to handle and its heating value does not decrease on exposure. It is stable—that is, it does not change in the weather or break up further in the fire. The material is, however, smaller in size than any fuel we use except the fine sizes of anthracite. Having more volatile matter it kindles better than anthracite, and holds the fire well. It is also smokeless.

To use this material there are two possible procedures, one of which is to grind all the material fine and add a suitable binder, making briquets simulating anthracite of domestic size, and the other procedure would be to dodge the relatively expensive briquetting process and use the material direct. Past work has shown that very acceptable briquets can be made from this material, but industry in this country hesitates at the considerable expense and uncertainty of entering the briquetting field. The briquet in this country is still considered as a rather strange intruder in our family of fuels, even in our Eastern states, where briquets are becoming more common. A pile of briquets dropped on the sidewalk is still apt to attract the curious attention of the passerby. In Europe the briquet in several forms has long since been accepted as a standard fuel and not as a curious substitute.

Besides if we are slow to adopt the briquetting process perhaps we may learn to use at least a portion of this lignite char in its natural state. The material is too fine to be held on the usual furnace or cooking-stove grate or in a base burner. It has another peculiarity also which makes it different from fine sizes of anthracite: A glowing bed of lignite char reduces CO_2 to CO in an effective manner. In other words, it makes a most excellent producer gas, and this reaction, which is a cooling one, is so rapid that if the fuel bed is more than an inch or so in thickness the upper part of the bed is cooled and the fire appears to be dead.

For domestic heating lignite char lacks the cheerful glow of anthracite, unless the fuel bed can be kept uniformly thin. By introducing on the grate of an ordinary magazine base burner suitable for anthracite, a concentric cone so arranged as to extend into the magazine opening, and placed so that the fuel is compelled to flow over its surface in a thin sheet, the air entering through perforations in the cone will support rapid combustion, will give a glowing surface to a thin fuel bed and support a luminous and smokeless flame in the combustion space. This makes a fire quite as acceptable and grateful as anthracite. In this way the small lignite char

KITCHEN STOVE FOR CONSUMPTION OF "GRUDEKOKS"

On the top on the left is the warming oven; below it lies the cooking section. To the right of these compartments is the hot-water tank with its spigot. Below them all is the drawer-like grate for the burning of the "grudekoks" and another drawer which acts as ash bin for the fire above. Under the ash box is another box in which the fuel is stored. The stove is composed of tile and acts as a heat reservoir.

*Chief Mechanical Engineers, U. S. Bureau of Mines.

can be used direct, but no equally satisfactory solution of the problem for either the cooking stove or the heating furnace as yet has been found.

There was some doubt, therefore, as to whether the unbriquetted material was sufficiently practicable to warrant being actively advocated, and hence it was with much interest that I found that the material was already in rather extensive use in Germany under the name of "grudekoks." Although made from brown coal the residue is substantially the same as the residue we get from American lignite. It is broken up in the same small sizes and analyzes high in fixed carbon and low in volatile matter. It is, perhaps, a little softer than our material, but it presents the same questions as to how it shall be burned as does our lignite char.

In central Germany some brown-coal deposits contain material yielding a high percentage of tar when subjected to low-temperature distillation. This material appears in the brown-coal bed as lighter colored layers, which are mined separately from the darker material. This lighter colored brown coal is subjected to low-temperature distillation in a circular kiln of simple construction, the resulting char being considered as a by-product, as the main objective in this process is the paraffin contained in the tar.

No attempt has been made in Germany to briquet this material, as an acceptable way has been found of burning the fine char direct without further processing and as the Germans do not have an anthracite habit to take into account. It is interesting to note also that this method of burning is entirely different from our own attempts at burning the char, which probably is due to national habits of heating. The American has always been used to an abundant fire, and, like the Englishman, he enjoys the feeling of radiant heat.

There is something in the glowing base-burner fire or the fire from an open grate that is much more cheerful, comfortable and homelike than can ever be obtained from the milder heat of a radiator. Even the old cannonball stove, that was so voracious of bituminous coal, never seemed to be quite at its best until its swelling sides were glowing red hot and radiating cheer to a circle of outstretched hands and feet. Most of our heating methods are built on the idea of a lively fire.

Burned in Tiled Structure with Many Flues

The fireless cooker, with its relatively low-temperature cycle, seems to be the only popular exception to this general rule. In Continental Europe, however, the habit has been quite different. The household stove developed into a ponderous tiled structure with a relatively small grate, a labyrinth of flues, and a highly ornamented tiled surface, against which one must lay one's back to get any considerable feeling of heat. The mass of the tile and brick absorbs and gives off heat, and performs the same function of heat storage as does the mass of water in our hot-water heating systems.

In fact, these tiled surfaces have temperatures of about the same order as a hot-water heating plant would give to radiator surfaces. The German is quite thrifty in his use of fuel in these stoves, regulating the air supply almost with a micrometer adjustment, and by devices much better designed than those usually found on our own stoves.

These people also are used to cooking with charcoal, which gives a relatively mild heat. There appeared to be no considerable demand, therefore, for a glowing, radiant fire to meet a national habit of either heating or cooking. The result was something quite different from anything we have here. It might be said that grudekoks is burned in a bureau drawer, for the stove structure is a cabinet with a series of drawers and door-covered compartments that would challenge the curious to guess whether he was looking at a bureau or an ice chest.

The device is based on a simple fact that has been observed by everyone who has used lignite. In burning lignite, although much fuel may drop through the grate, the carbon content of the ash always is extremely low. There is practically no loss due to carbon in the ash in burning either lignite or lignite char. Such material as does drop through the grate will continue to burn in the ash much as charcoal covered in a bed of ash will hold a fire for a long period, and finally be entirely consumed. Lignite char acts much as charcoal in this respect, and will burn also with air supplied entirely from above.

Thin Covering of Char Over Bed of Ash

If, therefore, a bed of ash be provided of sufficient depth, the char will burn on it and continue to hold a fire for a long time. If lignite char be scattered over this bed of hot ash to a depth of, say, half an inch, and slightly raked into the bed, so as to make contact with the hot char, the material will be gradually ignited and will burn slowly, as does charcoal in a brazier. The German grudekoks oven provides, therefore, a drawer arranged to hold a bed of ash, and to have at a short distance above it a cast-iron stove top with lids, in the usual manner.

From the back of the drawer space a small pipe 2½ or 3 in. in diameter connects with the house chimney. Air is admitted over the fuel bed through a damper in the face of the drawer. It is needless to say that the quantity of heat generated is small, and an American would call the fire slow, but that it fits with the German habit, and is effective, is shown by the fact that last year over 400,000 tons of grudekoks was used in this manner for domestic cooking and heating. The accompanying illustration depicting this oven shows below the fire drawer another similar drawer adapted to receive the excess ash as it is shaken from the upper drawer.

Below this is shown a deeper drawer in which grudekoks is stored. To replenish the fire an ordinary sugar scoop is used to sprinkle a thin layer over the glowing surface in the drawer. This surface has an area of about 2½ sq.ft. Grudekoks is a very clean fuel; it does not stain the hands or blacken material with which it comes in contact. The space above the fire drawer, where cooking is done, is shown to be inclosed as a cabinet which can be closed by a front upward swinging door. This inclosure is carefully insulated to conserve heat as much as possible.

Above the cooking space is a warming oven, and to one side is a water tank which can be filled at the top, the contents being drawn off at a faucet as needed. Whether this kind of a cooking device will appeal to the American housewife is yet to be determined. We cannot forget that even the fireless cooker has a host of friends. The Bureau of Mines hopes to get some information on this phase of the subject, but it is at least encouraging to know that this char, unbriquetted, has had a commercial demand that absorbed in one year over 400,000 tons. It can therefore well lay claim to careful consideration as a member in good standing of the family of fuels.

Flotation Methods Successfully Used in Great Britain To Clean Coal, Culm and Sludge

Sulphur, Less Attracted to Froth Than Coal, Reduced in Percentage—Culm, Three-Fourths Ash, Cleaned by Flotation—Good Coal Sold—Plants Use Middlings—Advantages of Clean Coal for Blast-Furnace Coke

By C. H. S. Tupholme
London, England

HITHERTO in Great Britain coal has been washed by various gravity methods, which, being dependent on differences in specific gravity, are, economically speaking, limited to material above a certain size. A supplementary, or complimentary, system has been needed for the washing of finer material.

Such a method has been evolved by the Minerals Separation Ltd.,* the owners of the froth-flotation processes used hitherto only for the separation of metalliferous ores. In this process the coal to be cleaned, after being ground in the majority of cases until the particles pass through a screen of $\frac{1}{16}$ linear inch aperture, is mixed with from three to four times its weight of water. The mixture is then agitated by suitable methods and a small quantity of special reagent added. The reagent may be an oil or a coal-tar product or the waste from some industrial operation, one pound, generally speaking, being required for each ton of material treated.

Frothing Agents of Many Kinds Can Be Used

Several kinds of "frothing" agent are available, the selection of which is made according to the type of the coal and the nature of ash it contains, for some frothing agents are capable of floating even the ash. Again, by successive addition of frothing agents, a fractional separation of raw coal into concentrates of varying grade can be made.

Thus, Bury reports that the flotation of Welsh coal can be effected best in the presence of the wash water from naphthalene washing after all the naphthalene has been removed. By this preliminary floating a deashed coal containing about 3 to 4 per cent of ash is obtained. If now, a further addition of about half a pound of paraffin per ton of coal treated is made and agitation and floating are resumed, a second concentrate in the form of "bone coal," containing 12 to 15 per cent of ash, is obtained. This is well suited for use under boilers. The final residue is, of course, a material of a high ash content—80 to 90 per cent.

Besides the above coal flotation reagents, cresols, oil of pine, naphthylamine, xylidine and various tar oils have been suggested and, in some cases, used with success.

Agitation in the presence of the reagent produces a multitude of minute air bubbles, to which the coal particles attach themselves. The loaded bubbles rise to the surface of the water and form a froth containing the coal, which accordingly is removed. Meantime such material as contains a high percentage of ash sinks.

*Apparently in Great Britain the Minerals Separation Co., Ltd., has entire control of the flotation of minerals by oil. In the United States and Canada other systems of flotation are in operation, though little has been done in the United States in the cleaning of coal by this method.

The process may be applied to a wide range of material: (1) Coking coals, (2) low-grade coals for fuel purposes, (3) dump wastes, (4) stocks of slack, and (5) washery sludge or other coal-bearing material. The main difference between the treatment of high-grade coal and low-grade waste lies in the respective proportions of coal and waste—a factor for which plant design readily makes allowance.

A striking feature is the facility wherewith one grade of coal is, by means of reagent control, separated from another without screening or classification. By flotation it is possible to separate into its component parts any kind of coal. The raw product from the mine is a mixture of what may be termed pure coal, bone coal and shale. The first of these may be defined as a coal substance having no free but only fixed ash. As a result of the frothing process the pure coal is separated,

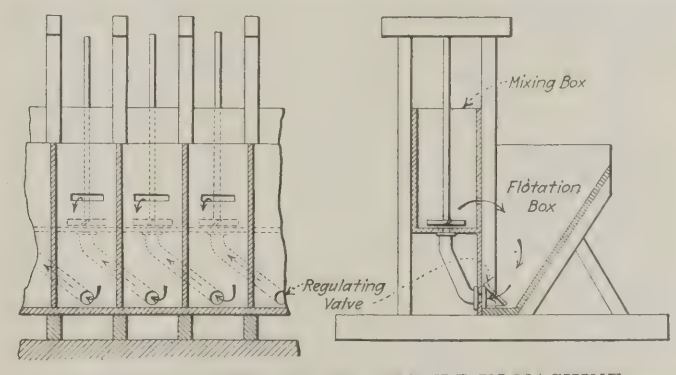


DIAGRAM SHOWING FLOW OF PULP IN MACHINE

Flotation reagent and water are introduced with coal in a mixing box, the mixer being driven by a vertical shaft. The product passes into the flotation box, where the froth rises and is scraped off with its coal. Thence it may be delivered by a conveying belt or trough.

the bone coal being left with the shale. In a later part of the process the bone coal is segregated. It may be added to the pure coal already obtained or it may be reserved for boiler, locomotive or producer uses.

The dimensions of a machine having a capacity of 672 to 1,120 net tons per 24 hours are as follows: Length, 37 ft. 6 in.; width, 16 ft.; height, 15 ft. 3 in. The coal for treatment, the flotation reagent and the water are introduced into the machine, the mixture passing at once to the first mixing box, the vertical shaft driving the mixer, or agitator, being indicated in the illustration.

Two steel joists running the whole length of the plant carry the horizontal shaft and gear boxes for driving the vertical agitator shaft, the agitators themselves being merely four-bladed horizontal paddle wheels. In front of each mixing box is a flotation box of V shape, the hand wheels being for the purpose of regulating the transfer of the material under treatment from flotation

TABLE I—RESULTS OBTAINED FROM WASTE MATERIAL AT THE ABERAMAN TIPPLE OF THE POWELL-DUFFRYN COAL CO.

		Percentage of Waste Material Recovered	Ash Percentage	B.t.u. per lb.
(1)	Raw coal	..	70.4	2,280
	Washed product	15	15.6	12,450
(2)	Raw coal	..	67.6	5,230
	Washed product	21	10.5	12,280
(3)	Raw coal	..	48.5	4,390
	Washed product	30	10.5	12,680

box No. 1 to mixing box No. 2 and from flotation box No. 2 to mixing box No. 3, and so on through the plant.

The material in the last box of the series forms the reject from the plant, practically all the coal having been separated out by the time that stage is reached. The flappers, or paddles, at the front of each flotation box are for scraping off the separated coal, which may be delivered to any appropriate form of conveying belt or trough.

The illustration shows the method of connecting each flotation box to the next mixing box—for example, flotation box No. 1 to mixing box No. 2—and so on as previously explained. The machine is designed for continuous working and operates automatically, one man per shift being capable of supervising plants capable of dealing with a maximum of 9,000 net tons in 24 hours. The application of the process to the treatment of all coal-bearing material is well established. Table I shows the results obtained from waste material at the Aberaman tipple of the Powell-Duffryn Coal Co.

Commercial operations on the Aberaman property show that a cleaned product containing from 6 to 10 per cent of ash can be obtained from dump material in which that impurity runs to 60 per cent.

The main difference between the treatment of high-grade coal and low-grade waste lies in the different proportions of product to waste—a factor which is readily allowed for in designing the plant. The perfect separation of coal from shales and other impurities is obtainable in whatever proportions the minerals may be mixed. The finest coal-dust, that found on colliery roads, on the floor of the tipple and in washery settling ponds, to which the fine untreatable discard of gravity washers is let, is readily amenable to treatment.

Strange to Say, Pyrite Also Is Removed

At first sight it might appear that the presence of pyrites in a coal would bar its treatment by flotation, as pyrites is one of the metallic minerals readily concentrated by the process. The reagents employed to treat coal, however, are different in character from those necessary for pyrites, and it is found that in the treatment of pyritic coal the coal floats more readily than the pyrite, with the result that the product obtained contains a lower percentage of sulphur than the raw material. Gypsum and other sulphates, practically speaking, are totally eliminated by the process.

It will be appreciated that the foregoing table includes, for purposes of brevity, final products only, and that the coals cited are readily separable into the constituent parts, thus yielding two, three or four products, as desired, each of which may be devoted to its appropriate use.

Actual results obtained by the flotation process include the following: (1) A coking coal was treated and two concentrates obtained. From 100 parts of the original, 62.7 and 13.2 parts of the concentrates were obtained, and 24.1 parts of residue were left. As the ash content of the original, the first and second concentrates and the residue were respectively 24.0, 3.4, 24.5 and 78.5 per cent; the combustible recovery was over 90 per cent. The low ash content of the first concentrate and the relatively large proportion of the latter are noteworthy.

(2) Similar trials were conducted with a non-coking coal, 100 parts of which gave 41, 28.6 and 30.2 parts of first and second concentrates and residue respectively. The high ash content of the original coal—21.8 per cent—was reduced to 6 per cent and 9.1 per cent in the concentrates, the ash in the residue rising to 74.4 per cent. The recovery of combustible matter was nearly 85 per cent. As the original coal was high in ash, this must be regarded as a satisfactory result.

(3) A washery residue, which of course, contained a high quantity of ash—namely, 61.2 per cent—was treated to produce a combustible concentrate and a residue, which were obtained in the proportion of 33.2 and 66.8 per cent. The ash content of the former was somewhat high, 10.1 per cent, but under the circumstances, especially as a combustible recovery of 75 per cent is shown, the result must be considered satisfactory. The washery residue in its original state is of little or no value, and the production of a good fuel, coking coal, or other combustible material has much economic signficance.

(4) Experimental runs have also been reported with washery fines as starting material. The ash contents varied from 13 to 45 per cent, and satisfactory yields of concentrates have been obtained such as have proved capable of being used for the manufacture of a good metallurgical coke.

(5) High efficiency is reported in the washing of a Welsh coal containing 10.1 per cent ash, from which a total recovery of combustible matter of more than 95 per cent was obtained. Thus, the washery afforded 87.2 per cent in the first concentrate, with 3.25 per cent of ash; 2.4 per cent in the second concentrate, with 19.2 per cent of ash, and a residue of 9.5 per cent, with an ash content of 72.1 per cent.

(6) Somewhat fuller details are available as the results of washing Derbyshire coal, analyzing 29.55 per cent of ash, 48.2 per cent of fixed carbon, and 22.35 per cent of volatile matter. A yield of concentrate of 75.1 per cent was obtained, which showed only 9.86 per cent of ash, the fixed carbon and volatile matter running respectively 60.24 and 29.9 per cent. The residue (24.9

TABLE II—RESULTS OF TESTS

Original		Cleaned Product		Tailings

21	63.8	28.7	10.8	71.3	86.5

per cent) contained 82.45 per cent of ash, with only 2.75 per cent fixed carbon and 14.8 per cent volatiles.

The most striking feature of the process undoubtedly is the facility with which one grade of coal is separated from another merely by the control of reagents and without the aid of any form of screening or classification. This property renders the process extremely easy to regulate: it requires only elementary skill and a little intelligence on the part of the operative in charge to produce the most profitable separation into: (1) Fine, high-grade, low-ash coal; (2) band, bone or bastard coal of dull appearance and high combined ash; and (3) shales, clays, gypsum, etc., the results varying, of course, with the type of coal treated and the purposes for which the products are intended.

Bone, band or bastard coal cannot be separated by any gravity treatment, and success such as this is new in the annals of washery practice. The ash content in band coal may be said to be almost entirely molecularly mixed with the carbonaceous substances, and no degree of crushing and washing would effect its purification. As it can be removed by froth flotation the true coal can be made available for the manufacture of fuels of a new standard. This suggests a probable revolution in blast-furnace practice. We have succeeded in making from such concentrates coke containing 4.8 to 5.0 per cent of ash, the physical strength of which is much greater than that previously obtained.

TABLE III—RESULTS OBTAINED IN FLOTATION OF A COKING COAL WITH 10.14 PER CENT OF ASH

	Per Cent By Weight	Ash Content Per Cent
Pure coal	87.2	3.25
Bone coal	2.4	19.2
Shale	9.5	72.1
	99.1	

The main factors in the preparation of coal for coking were established in the course of extended investigations by a well-known firm of Cleveland ironmasters, who are now installing a plant having a capacity of 672 to 1,120 net tons per 24-hour day.

The samples on which the investigations were conducted consisted of high-grade coal associated with bone coal and closely admixed with carbonaceous shale, the ash content of the whole being about 12 per cent. The complete recovery of the pure coal was effected and the ash content reduced to less than 4 per cent. These experiments proved that the recovery of good coal would in practice be between 98 per cent and 100 per cent.

Table III shows a typical separation effected in the cleaning of coking coal carrying 10.14 per cent of ash in the raw state.

Obviously the bone coal may be mixed with the high-grade product if desired, but in this particular case it was proposed to make from the pure coal a high-grade coke carrying from 5 to 5.5 per cent of ash and to employ the bone coal for boiler or producer use, rejecting the shale as waste.

The value of the flotation process to ironmasters is indicated in Table IV and is based on the reduced consumption of coke per ton of pig iron produced as a result of the low ash content of the coke.

These figures may be resolved into a saving of 71.8c at normal exchange per net ton of pig iron produced from ordinary Cleveland ironstone, the bone-coal constituent of the original coal being utilizable at its purchase value in industries other than the manufacture of pig-iron coke.

For the production of coke for metallurgical purposes various coal-washing devices have found employment, efficiency being dependent on the difference between the specific gravities of the coal, shale and other impurities.

By means of these gravity processes, which involve prior or subsequent screen sizing for their effective operation, moderately good results are obtained on various sizes between 2½-in, and, say, ½-in. or ⅜-in. aperture. But on material which passes the ⅜-in. or ½-in. screen established methods of specific-gravity washing yield but poor results, whereas the extremely fine dust or silt cannot be cleaned by jigging or classification.

Efficient specific-gravity washing thus is limited to coarse material, and any attempt to include the smallest size in the washing process results in serious trouble, owing to the finely-divided shale being included in the washed product, which raises the ash content and obstinately retains water. Even with the coarser sizes the efficiency of these processes is entirely dependent on the nature of the coal.

Run-of-mine, generally speaking, consists of a mixture of high-grade coal (carrying little fixed ash) bone coal (relatively high in fixed ash) and shale carrying various small proportions of carbonacous matter, according to the nature of the deposits. Other impurities, such as iron pyrites, calcium sulphate, etc., sometimes are present. The mixture in some cases is intimate, in others the constituents occur in layers of greater or less thickness. Where the layers are thin or the separate constituents finely divided, effective separation, of course, is impossible, unless the material is crushed fine enough to separate these constituents.

Ash Particles in Coal Greatly Weaken Coke

In these cases it is clear that jig washing cannot be fully effective. Similarly gravity processes fail where the specific gravity between the high-grade and low-grade material is only small. Shale and low-grade bone coal are doubly harmful constituents of a coking coal, as not only does their presence increase the ash content of the coke but each particle present forms a center of weakness from which cracks radiate. It is chiefly due to the presence of these foreign substances that fine coke, or breeze, is produced. It has become customary to lessen this effect and to produce a more homogeneous product by crushing coking coal to about ⅜ in.

Froth flotation is, as has already been stated, applicable to the treatment of coal which will pass an aperture of approximately 0.1 in. square; it is independent of any difference in the specific gravity of the constituents and will separate with equal effectiveness the coarsest and the finest of suitably crushed product, classification being neither necessary nor advisable. By means of froth-flotation high-grade coal can be separated from bone coal and bone coal from waste, which makes it evident that the method has a much wider range of efficiency than specific-gravity methods.

Several full-oven charges of coke have been made on material thus prepared by flotation, and the following advantages obtained:

TABLE IV—SAVING EFFECTIVE IN COKE PER TON AT BLAST FURNACE

Coal	Per Cent Ash in Coal	Coke per Net Ton Of Pig-Iron, Lb.
Mine coal	12 to 15	2,500
Jig-washed coal	8	2,300
Froth flotation	3 to 4	2,100

(1) Ash reduction—saving in cost of handling, particularly where the product has to be transported some distance before it reaches the coke oven.

(2) Economy in coking—the product is more highly bituminous, yields a richer gas and a larger quantity of byproducts. Furthermore, the ash reduction makes it possible to charge the ovens with coal that will yield a coke with greater thermal capacity per pound.

(3) Production of superior coke—the coke produced from flotation-washed material is superior to any other type; it is harder and denser; it contains a minimum quantity of ash—sometimes under 4 per cent; it resists the crushing effect of the blast furnace, and offers all those advantages that only such a coke could offer.

(4) Economy in furnace space—where a coke cleaner than usual is employed there is room for an increased quantity of iron ores and fluxes. At an iron works in the North of England it recently was proved that flotation coke melted 17 per cent more iron than an equal weight of normal coke; in other words, 85 parts of flotation coke did the work of 100 parts of normal coke.

(5) Minimum of silica owing to ash reduction—less coke is required and less limestone flux per ton of ore.

(6) Economy of thermal efficiency of blast-furnace—the production of slag is reduced. Fewer thermal units are therefore employed in its production, and fewer taken from the furnace by the molten slag.

(7) Less fines—a dense coke affords a greater quantity of large coke, a lesser quantity of fines being removed in screening. The total value of the product of the oven thus is raised. At a large steel works in the North of England it was found that only 1½ to 2 per cent of coke breeze was made in place of 7 to 8 per cent which was produced when washed coal had been used.

(8) Maximum thermal efficiency at critical zone of furnace—the resistance of the hard coke to the crushing effect of the furnace burden minimizes the tendency toward coke consumption in the upper zone of the furnace, and the maximum number of heat units is developed at the tuyere lines; or, in other words, at the point of highest thermal effectiveness.

(9) Economy in transportation—savings are effected in the cost of transportation in two ways: (a) Directly, by eliminating the ash for the transportation of which freight charges must be paid, and (b) indirectly, for, owing to the superior hardness of the coke less fines are produced, and the maximum quantity of product arrives at its destination as large coke, a point most important to foundrymen and smelters.

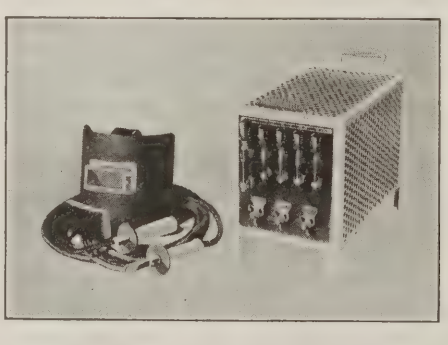
Coal Furnishes Its Own Flotation Oil

Several plants are in course of erection where by-product ovens are employed for coking coal, the process in such cases being independent of outside sources for the supply of reagents, as coal tar produces everything that is required.

The cost of flotation is in the operation itself, and as the cost of the flotation oil is almost negligible, the main charges are for power and labor. It has been stated that the power cost is 1.34 kw.-hr. per short ton of coal treated, so that a few cents per ton covers this cost. Labor charges are small, and interest and depreciation cost little, as a plant that is capable of treating 1,000 net tons of coal per day costs $130,000. Allowing an interest and depreciation charge of 20 per cent per annum and 300 working days in a year, the charge will be less than 9c per net ton of coal treated.

Welders for Rail Bonding and Repairs

TWO new portable electric arc-welding machines recently have been constructed for mine use. The lightweight welder weighs only 46 lb. and is intended primarily for rail bonding. The resistance is made up of coils of nickel-chromium wire, mounted by a patented method on refractory porcelain insulators. Sufficient ventilation is provided so that the machine operates well below the critical temperature of the resistance wire. This welder can be used with any line potential between 175 and 275 volts. Four knife switches control the welding current. With these switches it is possible to get ten combinations giving current values from 20 to 150 amperes. The shunt welder also is a resistance machine but with a shunt connection which is used when the work is positive in polarity and the electrode negative. With this shunt in use, the machine has practically the same characteristics as a motor-generator outfit—that is, low voltage, short arc and uniform welding heat. The welds made in this manner are tough and machinable.



SHUNT WELDER CAN BE USED WITH CURRENT OF POSITIVE POLARITY

Welder has much the same characteristics as a motor-generator outfit.

If desired, the shunt welder may be used, unchanged, as a straight resistance machine. It may be used with the shunt for repair welding and without the shunt for rail bonding.

The resistance element in this machine is of the same type as that in the other welder. It will not be overheated by a continuous short-circuit at 280 volts, and may be used on any line having 150 to 280 volts potential. It weighs about 100 lb. Both machines are manufactured by the Ohio Brass Co., of Mansfield, Ohio.

FORTY-SIX POUND WELDER

Is suitable for rail bonding and will work with any potential between 175 and 275 volts.

Welders of the types above described find wide application at mining plants as the uses to which they can be applied are many and varied, embracing both field and shop repair work. As a result they are useful pieces of equipment.

Longwall Retreat with Coal Conveyors Modified so as To Make Each Face Independent of Every Other

Air Rooms Are Driven in Pairs so That It is Not Necessary to Maintain Communication Between Working Faces in Adjoining Sections—Faces Are Made Long Enough to Keep Cutting Machines Busy

By F. C. Cornet*
New York City

IN MY article that appeared in *Coal Age*, Jan. 4, p. 7, I showed a working method much like that in Fig. 1 but with single instead of twin air rooms. The air ran up the single air room and split at its head, the two air currents running back along the working faces of two separate sections and returning each by the conveyor rooms of its particular section. As the sections are not, or may not be, kept equally advanced, the air must travel the few feet between the faces of the sections by an airway which it may be difficult to keep open. At least there might be cases where the operator might fear that he could not keep such an airway free from falls. In Fig. 1 of this article is shown a way in which this objection might be met.

But here a few words of comment on the plan may be interposed. To the left of the main heading, shown in the center of this illustration, the workings are retreating and on the right they are advancing. The following description applies more specifically to the latter, but the reader will have no trouble in understanding, from the description of the right or advancing area, how the left or retreating area is to be operated.

Referring to the Second Right Heading, in Fig. 1, it will be seen that the rooms have a total length of 820 ft. and that the pillars between rooms are 400 ft. wide. All these pillars, however, are not solid. Forty feet inbye of the room separating two successive sections, an extra air room is driven, as shown, thus creating what I have designated as "twin air rooms." Each twin room receives air direct from the aircourse through a separate pipe overcast, as shown.

While the outbye member of any twin airway along the heading insures the ventilation of the face of the outbye section, the inbye member of the same twin airway conveys air to the face of the section next inbye. The face of every section being ventilated by a separate air room, it is no longer necessary to maintain a connection between sections, and so none is shown in Fig. 1.

As each section is independent, mining in any section may forge ahead of or lag behind that in contiguous sections, as the operator may decide. Each face in Fig. 1 of this article is twice as long as the faces in Fig. 1 of the previous article but they get twice as much air. Hence the number of men who may be employed per lineal foot of face (or lateral heading) is the same in both cases.

It is true that with this arrangement the cutting machines cannot pass, rapidly at least, from section to section, but the two faces of a section taken together offer enough development to the cutting machine to keep the latter occupied without seeking work in other sections. As to supervision, it is to be expected that a face development of 800 ft. is all that any assistant foreman will be able efficiently to supervise, especially if the same employee has charge also of the loading station connected with his section, which probably would be the arrangement made.

The distance between successive lateral headings has

*Consulting engineer.

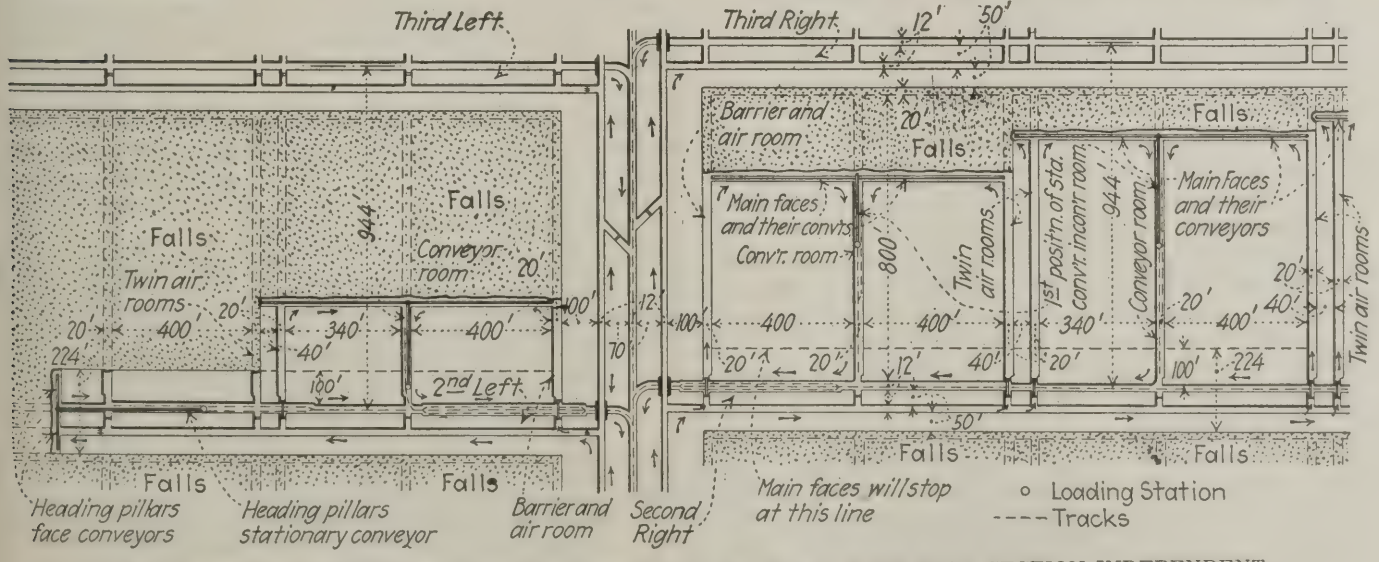


FIG. 1—RETREATING AND ADVANCING LONGWALL METHODS WITH EACH SECTION INDEPENDENT OF THE OTHERS

Of course, the longwall faces themselves are all worked retreating, but the order in which the individual sections are started may be made either retreating or advancing at will. The retreat is shown on the left and the advance on the right. By the use, where the sections join, of two air rooms at 60-ft. centers, each of the sections is separately ventilated, so that it is not necessary to maintain a connection between them.

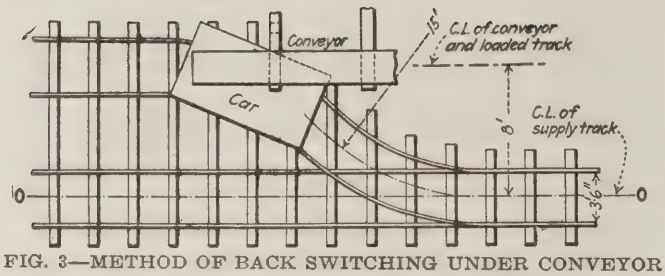

FIG. 3—METHOD OF BACK SWITCHING UNDER CONVEYOR
By this method the cars come continuously to the discharge end of the conveyor, saving much time in spotting them.

been increased in this plan so that it is now 944 ft. from center to center. The former arrangement reduced the narrow work considerably, but this layout makes a further important reduction. The great length of the rooms (820 ft.) consequent on the increased distance between lateral headings, together with the inadvisability of using conveyors more than 400 ft. long, caused the designer to locate the loading stations in the conveyor rooms themselves.

A loading station is placed in the beginning about half way up the room, as is shown in two of the sections off second right in Fig. 1. When mining gets close enough to this first location to interfere with the handling of cars on the tail track, the loading point is moved back toward the neck of the room, the new position chosen being the same as that shown in the first section off second left. Here the stationary conveyor is shown in its second and final location which is within that zone of coal, 100 ft. wide, which is left along the upper side of all lateral headings and which ultimately will be recovered when the heading pillar is withdrawn. This 100-ft. zone is shown also at the left of Fig. 1.

At both their locations in the conveyor rooms nothing prevents laying the conveyors as shown in Fig. 2, the loading end being curved gently upward instead of somewhat abruptly, as was shown in Figs. 2 and 6 of the previous article. As shown in Fig. 2 of this article, the more desirable inclination and the head of the conveyor can be included entirely within a space of 50 ft., which is short enough to permit the curved part of the conveyor and the loading tracks to be all laid within the 100-ft. zone above referred to.

The heading pillars will be recovered as shown in Figs. 1 and 3, the cars being taken beyond and beside the conveyor head, switched under it and taken out by another track, thus avoiding separately shuttling each car under the conveyor.

As the cutting machine proceeds on its work along the face, a line of props, called the "face line," should be set between the face and the conveyor at a distance from the latter equal to the depth of a cut. The distance between props in the face line may be less than 4 ft. and as much as 8 or 9 ft., depending on the kind of roof to be retained in place. As these props are set, the old face line, now against the conveyor on its working face side, is taken down. Ninety per cent of such props are good for further service. The conveyor is now moved against the new face line. Without loss of time a break line is then set against the conveyor on the side away from the face. This line is made of two or three rows of props set 2 or 3 ft. apart. As only two break lines are maintained, the old line is now removed. This is done easily if the props have been set on wooden slabs 15 in. long, and these slabs in their turn have been laid on fine coal.

In the salvaging of props, no risk to life or limb should be run. If mining is evenly and regularly conducted, it will be found practicable in most cases to save a large proportion of the props without any risk being taken. But no props ought to be left standing behind. Those which cannot be knocked down otherwise must be dynamited. An expert timberman or the average assistant foreman knows how to dispose of the most refractory prop by means of a quarter of a stick of dynamite extended at the end of a 16-ft. joint of half-inch pipe, or its wooden equivalent. Props left standing in the rear are much like the so-called "protective stumps" left in pillar work. Instead of protecting anything or anybody they are a source of trouble in that they disturb the regularity with which the roof breaks.

In some cases it will be preferable to make the break lines of cribs. These should be erected on wooden slabs resting on slack. When a mine operated on the system above described, or a modification of it, works irregularly, it may prove good policy to adopt the crib exclusively in constructing the two break lines, using props only for the face line.

Difficulties are quite likely to occur on a longwall face when a long shutdown occurs, especially in a mine in which the roof hangs and does not collapse as close to the break lines as desirable. In such a case an undue burden often rests on these supports. In cases like these when there is reason to believe that a long shutdown is in sight the break lines should be supplemented to tide over the idle period. Thus two good rows of supplementary cribs could be built, one between the two rows of props forming the regular break lines, the other in the place of the conveyor against the face line of props, the conveyors being placed in the air and conveyor rooms to make room for the cribs.

There will be few mines operated along the lines described above where temporary supplementary timbering, well done and done in time, will fail to keep the working faces open through the long periods of idleness. Most of the timber used in such work will be found still serviceable when the time comes to put the faces in working order.

I have no hesitation in saying that after a long shutdown—a protracted strike, for example—less repairs will be found necessary in a mine operating according to this new system than in one of same capacity where the room-and-pillar method is used.

Intimate acquaintance with the roofs of mines in West Virginia and Kentucky makes me confident that the timbering practices described, more or less modified and improved if need be to meet unusual local conditions, could be used with good results in those regions.

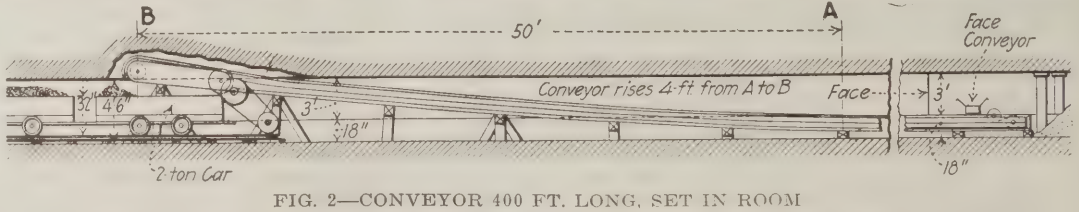

FIG. 2—CONVEYOR 400 FT. LONG, SET IN ROOM
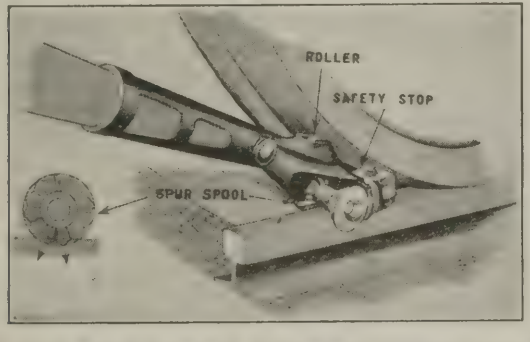
Instead of lifting up the conveyor head steeply it can be given a grade of about 8 ft. in 100 at its discharge end. At the loading end it is kept down in the cut that was made to give passage to the car while the room was being driven. In consequence the face conveyor delivering to it can be kept on the coal bottom.

Rubber Is to Be Imported as a Liquid

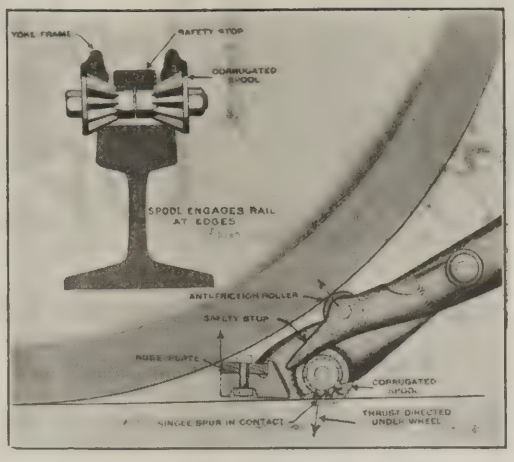
HITHERTO the milk or latex of the rubber tree has been coagulated before being shipped, this being originally performed by smoking it in the smudge made by burning uricuri nuts, as in Brazil, or by adding chemicals by which the same or a better result is obtained. Under the Hopkinson process the rubber is extracted as liquid from the latex and brought in that form to the place where it is to be manufactured.

It is claimed by the U. S. Rubber Co. that the action of kneading the rubber into the required shape, area and thickness by heat, pressure, tearing and mastication are harmful to the product and that the rubber produced from the liquid form without such intermediate action shows a substantial increase in tensile strength and resistance to abrasion, two vital matters in crude rubber. The product also is said to be unusually uniform.



There is the further advantage that fabrics can be made more readily to absorb the liquid than to knit up with the rubber dough, the latter process being one in which much pressure is used. It is also stated that rubber in the form of a solution injures the threads of the fabric to which it is applied.

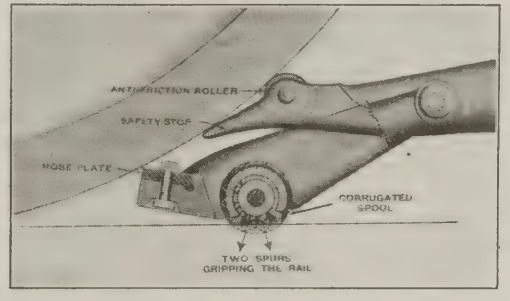
Pinch Bar with Changeable Grip Cannot Slip and Fall and Will Block Wheel



CAR-moving bars usually have only one grip. This soon wears on the rail and until it is sharpened the service given by the bar is unsatisfactory. Furthermore, when the car is induced to move by the pinch bar the point soon reaches a critical position on the wheel where any further movement of the car will rapidly move the wheel out of range of the point of the bar. In consequence the car mover must watch carefully lest he continue to bear so long on the bar that it will suddenly slip and lose its hold entirely, dropping him onto the tracks.

In consequence his fingers will be caught between the rail and the bar. This is a sufficiently severe accident but a worse may occur if the man is barring the car alone and uphill. The pinch bar being removed, the car may come back on him when he thus falls, and if it does not hit him he may console himself with the thought that he has lost only his labor and not his life. Fortunately a grade up which one man can pinch a car rarely is steep enough for a car to run back on it. But even with two men there is a risk, for the other man may not act with judgment.

To give the grip on the rail which is so important in



PINCH BAR WITH SAFETY AND TIME-SAVING FEATURES
This bar has a safety stop to prevent a sudden loss of grip on the wheel, a spool grip that being changeable will always give a firm hold and a nose plate that if the pinch bar is left on the rail will prevent the wheel from running backward.

DETAIL OF GRIP, NOSE PLATE AND SAFETY STOP
In this view the safety stop is not in operation, for the car has not moved far enough to let the handle down near the rail. The roller is and remains in contact with the wheel.

a car mover, the Smiley Car-Mover bar has a pair of corrugated spur spools, or wheels, so positioned that they grip or bite at four points on the lateral edges of the railhead, thus absolutely preventing the bar from slipping under load, no matter if the rail is greasy or even

CAR MOVES FORWARD AND SAFETY STOP IS AT WORK
The handle is suddenly arrested in its downward way by the safety stop. The pinch bar is so placed on the rail and under the wheel that it can be left unattended and will hold the car from rolling backward.

covered with thin ice. The spools are heat-treated so as to give extreme hardness without brittleness. Worn spur edges can be quickly replaced by simply loosening the nut of the holding bolt and turning the spool so that a new edge will come in contact with the rail.

To prevent the sudden falling of the bar when in use, due to movement of the car, the lower or short end of the handle casting is extended to form a safety stop which makes a positive contact with the under surface of the wheel when the bar handle is depressed to within about 8 in. of the rail. This arrests or greatly retards the downward motion of the handle of the bar, thereby preventing serious injury to the operative, such as bruised knuckles, broken knee caps, a sprained back or a wrenched neck.

The combined action of the spur spool and the safety stop prevents the car from rolling backward on grades. Furthermore it will hold all the headway gained in pinching up a grade, and it enables a single operative to do the work of two on slight grades, as the car is securely blocked, thus permitting the operative to leave the bar under the wheel while he goes forward and sets the brakes or places permanent blocking. A slight depression of the handle enables the bar to be removed. The bar is manufactured by H. D. Ganung, 209 Elk St., Syracuse, N. Y.

Problems of Operating Men

Edited by James T. Beard

Relative Safety of Safety Lamps Under Varying Conditions in Mines

Term "Safety Lamp" Somewhat of a Misnomer—Fatal Gas Explosion Makes Plain the Necessity of Extraordinary Care in Use of Safeties When Testing for Gas

REGARDING the use and care of safety lamps in mines, as suggested by several correspondents, in letters appearing recently in *Coal Age*, I desire to add my quota. The occurrence of a fatal explosion of gas and dust at our Wakesiah mine, Nanaimo, B. C., Nov. 24, 1922, prompts me to do this.

Notwithstanding our knowledge of the principles and conditions affecting the use of safety lamps and which we are prone to pass up, in practice, we fail to realize what has been so often pointed out in *Coal Age*, that a safety lamp is not safe under all conditions, but only when properly constructed, cared for and used. In fact, the term "safety lamp" is rather a misnomer.

The Wakesiah Mine Explosion

For the benefit of those who may not have heard or read of the accident in the Wakesiah mine, I will briefly recount the occurrence. It was an explosion of gas augmented by coal dust and cost the lives of two men, Gilbert McBroom, a pumpman; and Alfred Odgers, a fireboss. The former was killed by the force of the explosion, while the latter was asphyxiated by the afterdamp.

There were thirteen men working on the nightshift, at the time the explosion occurred. With the exception of the fireboss, Odgers, who carried a Wolf safety lamp, all of the men were equipped with Edison electric head lamps. The eleven men who escaped without serious injury were all working on the intake side of the explosion. McBroom, who was killed by the blast, was working on the return at a point 250 ft. distant from its origin.

Explosion Started in Brushing in Slant Heading

The place where the explosion started was a slant driven up the pitch off the first left level on the new slope. Two other places had been turned from this slope and were driven in a direction to parallel the level. In this section of the mine, the coal was 3 ft. 8 in. thick and overlaid with from 3 to 5 ft. of shale above which is a thinner seam of coal varying from 20 to 24 in. in thickness.

The seam is worked longwall, the roads being cogged on both sides. The roof is brushed in order to gain the required headroom. The brushing in the slant where the explosion started was about 3 ft. thick and had exposed the upper seam of coal. In such a case, it was not uncommon to get a little gas in a place.

Compressed-Air Pipe System in Use

A two-in. compressed-air pipe had been installed in the level and a 1¼-in. pipe extended up the slant. A 50-ft. length of hose was attached to the pipe for running a jack hammer. This hose was also used to drive out any gas that might accumulate during the night or when the place was not working.

From the evidence given at the inquest, the fireboss, Odgers, had fired a shot for two miners, about thirty minutes before the explosion occurred and about 250 ft. distant from that point. On leaving their place, he told them he was going to clear out some gas from a place above to make it ready for the morning shift. That was the last seen of him until his lifeless body was found a few hours later.

Rescuers Enter the Mine

Following the explosion, a rescue party entered the mine and within thirty minutes from the time the blast occurred they had found and carried out the body of McBroom, who was killed at a point on the return 250 ft. distant from the origin of the explosion. The body of the fireboss was not found until some time later, about 7 a.m.

The investigation showed that the hose had been changed from the level to the slant, for the purpose of clearing out the gas as the fireboss had said he was about to do, on leaving the men. The end of the hose, it was observed, had been deflected upward into the brushing and was blowing down the slant. The Wolf lamp, carried by the fireboss was found 21 ft. from the end of the hose and the man's body 84 ft. beyond the lamp. His cap bag containing 16 detonators or electric fuses, still intact, and a shotfiring cable were found lying at the stopcock, where the fireboss had turned on the compressed air.

Judging from the position of his lamp, the fireboss, after turning on the compressed air, had evidently advanced toward the face of the slant, against a highly explosive mixture that was blown from its lodgment by an air pressure of 90 lb. per sq.in. at the nozzle of the hose, which was pointing down the slant. The velocity due to this pressure may have been anything from 2,000 to 3,500 ft. per minute.

Though the lamp was provided with a double gauze, it apparently failed to isolate the flame of the gas burning within the lamp. The gauze chimney, as in all Wolf lamps, was further protected by a corrugated steel bonnet. Examination of the lamp when found showed that it was in perfect condition, properly assembled and the gauzes and glass undamaged. Later, the same lamp was subjected to a severe test in an explosive mixture, at the lamphouse, and withstood that test four times in succession.

Heating of Lamp Caused It to Fail

It is important to note, here, that a close examination of the interior of the gauzes showed the wires had been subjected to an intense heat, which was not apparent on the outside of the gauze where the wires showed little signs of having been heated. All who examined the lamp and observed the tests to which it was subjected in the lamproom are fully convinced that this lamp failed in the mine.

As a result of this experience, all of our firebosses are now required to carry two lamps, one a double-gauze Wolf safety lamp, having its flame set so low that it could only be used as a gas tester and eliminating, as we hope, some of the dangers of the lamp becoming heated when used for illuminating as well as for testing purposes. The other is a twin-bulb electric headlamp that can be turned off when making a test for gas.

Every Lamp Tested Before Being Taken Into Mine

Before being taken from the lamp cabin, each safety lamp must be tested in an explosive mixture. For a time, these requirements proved a little irksome to men who had been accustomed, for thirty-five years or more, to practice in the old way. The lesson taught by this sad occurrence, however, has impressed all our officials, particularly our firebosses, with the need of exercising the utmost caution in the use of their safety lamps.

In closing, let me say that the question of the relative safety of safety lamps in explosive mixtures, and even

in low velocities, appears to me to be worthy of further investigation and report. In my opinion, the fact that this lamp had been in use, for illuminating purposes chiefly, seven hours prior to its failure, indicates that it was overheated at the time and that probably caused it to fail. Is it not time when we can hope for some other means of testing for gas than by the safety lamp, which always introduces an element of danger?

Tamping Holes in Blasting

Different experiences the result of varied conditions, or differences in practice — Steel bars a menace to safety — Work of experts in demonstrating explosives.

FREQUENTLY, when reading the letters of correspondents in *Coal Age*, which invariably expresses the views of practical mining men, I have been at a loss to explain the difference in the conclusions and experiences of men engaged in the same undertaking. More than once, I have asked myself the question, Is this difference the result of varied conditions in mining; or does it come from difference in the habits and training of the men themselves?

Only recently, I became deeply interested in an article by John Rose, former district mine inspector in Tennessee, in which he expressed opinions at variance with the experiences generally expressed by coal-mining men of long practice. (*Coal Age*, Nov. 30, p. 880.)

Disparaging Danger

Commenting on the remarks of a previous writer in reference to the use of steel tamping bars being dangerous in blasting, Mr. Rose states that, while he does not wish to be understood as approving of the use of steel tamping bars, he does not consider the danger as great as the previous writer would have us believe. At the close of his letter, he again remarks that, during his experience of thirty-five years in mining in Tennessee, he has not seen or heard of an accident resulting from the use of steel bars for tamping.

While it is true that accidents from this source are not common, still I cannot agree with any one who assumes an attitude of indifference in respect to a condition that may cause an accident, with every probability of the result proving fatal.

Fatal Use of Steel Bars

In contrast with the claim of this writer, let me say that we have experienced two fatal accidents, in Northeastern Kentucky, both of which were known to be the result of using iron tamping tools. One of these accidents occurred at Willard, Ky., in 1920; and the other at Betsy Layne, in 1921. Others have occurred that were ascribed to the same probable cause, but generally lacked the necessary evidence to prove the fact.

The use of iron tamping tools, like coal slack for stemming, is generally recognized as dangerous practice. Nothing is to be gained by assuming that they are anything other than bad. Every effort should be made to discourage such practices, regardless of the fact that with proper care and caution, accidents may be avoided.

In this connection, let me say that to assume present-day miners can be depended on to use different size cartridge sticks to avoid danger in charging a hole drilled with a worn bit; or to suppose that they will employ heavy shooting paper when making up their cartridges; and use special care in placing their shots, is to expect more than what is warranted by actual facts and observation.

Seldom do we find a miner with more than one cartridge stick; more often he has none at all. We are most likely to find him using ordinary newspaper for shooting paper, and stemming his hole with coal slack. It is these conditions that have prompted me to offer a few comments in the interest of greater safety in blasting.

Looking Backward on Discipline Twenty Years Ago

Looking back on mine discipline of, say twenty years ago, and comparing it with the conditions that have existed in our mines during the past six years, one is led to believe that better mining conditions and not improved mine regulations have been our salvation in many instances.

Owing to the fact that mine workers of today cannot be depended on to do the safe thing, mine officials and particularly mine foremen and safety inspectors should make every effort to see that the miners in their charge are provided with the safest tools and employ the safest practices possible.

For several weeks, it was my good fortune to be required to check up the results of three different blasting experts, employed by different concerns to demonstrate the use of the different explosives manufactured by their respective firms. Each of these experts were engaged in soliciting the business of a large coal corporation operating some seventy mines.

Applying Expert Knowledge in the Mining of Coal

My observation showed that each expert used the same precautions, employed about the same amount of explosives, and obtained results that were almost identical as to the amount of lump coal broken down and the general results of the shot.

There were many old American miners employed in those mines. When these were asked their opinions concerning the shooting of their places, they naturally resented the idea that any one could get better results than they could themselves. However, my observation convinced me that, in most all of the places, each of the three experts was able to get better results than the old miners who worked the places.

The only difference between the miner and the expert, in the performance of the work, was that the expert took far greater care in preparing his stemming and tamping the hole. Special care was exercised to get all small stones out of the clay, which was then worked in the hands until it had the consistency of putty.

The first dummy was placed gently and pressed firmly back on the charge. Only permissible explosives and electric blasting caps were used and the entire hole was tamped hard to the mouth. Their methods proved safe and the results exceptionally good.

Pikeville, Ky. George Edwards.

Caviling System in England

Choice of working places, by lot, each quarter—Origin of system in North of England—Miners choose their own partners—System gives satisfaction and creates harmony.

IN connection with improving the conditions in coal mining, to which reference has been made by other writers, kindly permit me to mention what is known as the "caviling system" practiced in the North of England. Whether or not it could be applied with equal success in this country would have to be determined by trial. Of one thing, however, I am certain; it insures a square deal for all the miners and is profitable for the operator.

In that system, all the working places in the mine are raffled off four times a year. At the end of each quarter, the miners draw lots, which determines the place where each must work for the next three months. Every man accepts his lot with goodwill. If he has drawn a bad place, he consoles himself that he may do better next quarter.

Origin of the "Caviling System"

As far as I know, the caviling system originated in the North of England. Evidently, its purpose is to have all miners share and share alike. In every mine, there are good and bad places and the invariable problem of a mine foreman is to keep men at work in the poorer places.

In this country, when a man finds that he must work in a place where he can earn a mere existence, he generally prefers quitting. As a result, such places will often stand idle so long that they get in bad condition. The first newcomer that happens along is sure to get one of these places, and the foreman must put it in safe condition before allowing a man to start to work there.

It will frequently happen that a foreman finds that he has under estimated his running expense for the month. Then, in order to prevent a "bawling out" by his superintendent, he prefers to let these places stand idle for a time rather than timber them.

Before next month rolls around, one or more of the places may have caved tight, causing a loss of much coal and

track. It will often happen that an empty car, left standing at the face, is caught by the fall and cannot be recovered. The trouble may not be confined to a single place, as the cave will often shut off the ventilation from adjoining places and require much work and expense before the trouble can be remedied.

The caviling system has the advantage of eliminating these troubles, since the foreman is then bound to give the same care and attention to all places where men are working. There is besides another feature that should be mentioned, as it tends to create harmony. Every miner is permitted to choose his own partner.

When a man is compelled to work, from day to day, alongside of a man with whom he is not on friendly terms, there is sure to be trouble. Neither of the men can do their best work and, before long, one or the other will find some excuse for quitting. In my own experience, on a few occasions, I have been sent to dig coal with a man who was a foreigner and could not speak English well enough for me to understand him. At the best, I can assure you the experience was disagreeable.

In closing, let me say that the caviling system, in England, gave good satisfaction to all concerned. There was harmony among the miners, and the operators derived an unquestioned benefit. I do not know why a similar system could not be worked to the same advantage, in this country.

Frontier, Wyo. WILLIAM ALLAN.

Inquiries Of General Interest

Action of Safety Lamp Flame in Firedamp Mixture

Observed Elongation of Flame Assumed as Due to Increased Velocity of Air Touching the Flame—Flame Lengthened in Effort to Reach Air Required for Combustion

KINDLY permit me to submit for the consideration of *Coal Age* and its readers a question of theory that has engaged my study for some time and which I am anxious to see discussed by others. On numerous occasions, I have propounded the question and my solution of it to firebosses and other mine officials; but have almost invariably received the answer that the lengthening of a lamp flame in the presence of gas is due to the burning of the latter or, as expressed by some, "the pull of the gas."

To my mind, this general and indefinite explanation, if such it may be called, conveys no positive idea and fails to satisfy the inquiring mind. Believing that our knowledge is of little practical value, except as we apply it to determine the causes of observed effects, I have studied to ascertain the cause of the lengthening of the flame of a safety lamp burning in an atmosphere charged with gas. Following is a brief summary of my conclusions:

It is a well known fact that all fluids, liquid or gas, if free to move, travel in the direction of the greater pressure. For example, a ventilating fan may act to increase or to reduce the pressure in the fan drift and, as a result, the air current is moved from the fan or towards it, according to the greater pressure, the ventilating pressure being above that of the atmosphere in the first instance and below that of the atmosphere in the second.

Now, applying this principle to a safety lamp, let us first assume that the lamp is burning in normal air, no gas being present. Naturally, the air in contact with the flame of the lamp is heated and expanded, which causes it to rise. In that condition, the air exerts a lesser downward pressure than at its normal temperature and an inflow of air toward the flame below is the result, the flame maintaining a certain height.

Assume that the lamp is now inserted into an atmosphere charged with gas. This mixture being lighter than normal air, the upward air pressure is still further increased and the downward pressure decreased, with the result that the inflow of air toward the flame is more rapid than in the first instance. This increased velocity naturally forces the flame upward and lengthens it precisely as a flame is lengthened by the action of a blowpipe.

To test this theory by other means I resorted to the following simple experiment. Slowly lower a piece of cardboard over the chimney of a common kerosene house lamp. As the cardboard approaches the top of the chimney, the flow of the heated air rising from the lamp flame is materially impeded, the flame itself is expanded and partially fills the chimney.

My explanation of this phenomenon is that obstructing the flow at the top of the chimney causes the air retained within to become heated to such an extent that its downward pressure is considerably reduced, and the increased velocity (?) of the inflowing air lengthens the flame in a similar manner to that observed in the safety lamp.

Another instance bearing on this theory is the observed expansion of the normal flame of a safety lamp when the latter is carried into a place having a somewhat higher temperature. Most firebosses and other mine officials have observed this action of the lamp flame when entering a close warm place in the mine. The flame of the lamp will gradually expand and smoke the gauze and the glass cylinder. I would explain this effect in the same manner as previously described.

To my mind, whether the lamp flame is at a normal height or has been reduced, in order to observe a cap, the burning of the gas, contained in the air entering the lamp, does not act to increase the height of the flame as so many believe. Assuming a normal lamp flame, the supposition that the burning of the gas in the air lengthens the flame would involve the idea that the gas burns with a visible flame, which we know is not the case. This, to my mind, is sufficient proof that such a theory is wrong.

If my theory is correct; namely, that an observed lengthening of the flame of a safety lamp is caused by an increased velocity of the air supply, owing to a reduced pressure within the lamp, the inference is that a gas lighter than air is present and this is generally assumed to be methane, in mining practice. The result is, as I have known by personal experience, that the lengthening of the flame in a safety lamp has caused the report of the presence of firedamp when that was not the case.

In submitting this question to *Coal Age* and its readers, it is not my intention or desire to detract from the importance and significance of the indication of the lengthening of the flame of a safety lamp. The sole purpose is to get at the true explanation for the phenomenon. My theory may be entirely wrong, but, to my mind, it thoroughly explains the cause of the lengthening of the flame, which may be due to the presence of firedamp or otherwise. I shall be interested in learning how this theory is regarded by others. I. C. PARFITT.

Washington, D. C.

The theory submitted by this correspondent is unique and ingenious; but, in our opinion, is not a satisfactory explanation of the lengthening of the flame of a safety lamp burning in a gas-charged atmosphere. In the mind of the editor, the idea advanced has no warrant to replace the generally accepted theory that a lamp flame, burning in gas-charged air, is lengthened by reason of its effort to reach the air required for complete combustion of the carbonaceous matter forming the body of the flame.

What our correspondent has said with reference to the invisibility of the gas flame proving that it (the gas flame) is not the cause of the observed lengthening of the lamp flame, appears to involve a misconception of the effect of a gas-charged atmosphere surrounding the lamp flame. It is not assumed,

for a moment, that the gas flame combines with the lamp flame to produce the observed lengthening of the latter.

The generally accepted reasoning is that the gas-charged air surrounds the lamp flame with an envelope of burning gas that is, of course, invisible. But as a result, there are two effects: First, the heat of the burning gas increases the temperature and expands the volume of the visible lamp flame. Second, the oxygen that would otherwise reach the lamp flame is partly consumed in the combustion of the gas surrounding it. The natural result of this is that the incandescent carbons of the lamp flame travel further upward before finding oxygen sufficient for their combustion.

The same principle explains the tapering structure of all flame, as it reaches upward in the effort to find sufficient oxygen for the combustion of the carbonaceous material of the oil or other illuminant burned in the lamp. We shall be glad to have the question further discussed by those whose experience and training enable them to give a satisfactory explanation of the phenomenon.

Examination Questions Answered

Miscellaneous Examination Questions

(Answered by Request)

QUESTION—*Explain the effect of barometric pressure, in mines giving off methane (CH_4).*

ANSWER—A falling barometer indicates a decreasing atmospheric pressure. Any considerable decrease in atmospheric pressure means a corresponding expansion of the air contained in abandoned areas within the mine, owing to the relief of the pressure. As a result, air flows out from such abandoned places; and this outflow of air is very apt to be charged with poisonous gases, which are also frequently explosive, or become so when mixed with a larger volume of fresh air in the air current.

Therefore, a fall of barometric pressure is very apt to be accompanied with an increase in the explosive condition of the mine air. Extra precaution is required, at such times, in order to prevent disaster by reason of the ignition of the gas-charged air. The condition is much more dangerous in a dusty mine, where the presence of the dust floating in the air is an added menace to the situation.

QUESTION—*What difference is there, if any, in the quantity of air passing through two splits from a main aircourse, the first split having an opening 4x9 ft. and 4,000 ft. long, and the second split having an opening 6x6 ft. and 5,000 ft long?*

ANSWER—Assuming that the two splits are under equal pressure and the sectional area of each being 36 sq.ft., the quantity of air passing in each split will vary inversely as the square root of the rubbing surface, which in the first airway is $2(4+9)4{,}000 = 104{,}000$ sq.ft.; and in the second airway $2(6+6)5{,}000 = 120{,}000$ sq.ft. In other words, the quantity ratio, in the two splits, is equal to the square root of the inverse ratio of their rubbing surfaces, which gives

$$\frac{Q_1}{Q_2} = \sqrt{\frac{120{,}000}{104{,}000}} = \sqrt{1.1538} = 1.074$$

That is to say, the quantity passing in the first split will be 1.074 times that passing in the second, under the same pressure.

QUESTION—*(a) How would you determine when the coal dust in a mine requires more moisture, in order to render it safe from explosion hazard? (b) Name two or more methods of applying moisture to coal dust in mines.*

ANSWER—(a) To render coal dust immune and safe from explosion hazard, it should be sufficiently moistened to be plastic when compressed in the hand or molded, according to the recommendations of the Federal Bureau of mines.

(b) The means of applying moisture are numerous. Water cars have been used for watering the roads in small mines. Spraying the roads and travelingways, by installing a pipe system throughout the mine, is more efficient. At times, the pipes are perforated with small holes through which the water is sprayed. Again, short lengths of hose are used attaching them to plugs in the pipes. These are arranged at short intervals along the roads and travelingways.

Another system largely used is to humidify the mine air as it enters the mine, using steam for that purpose and raising the temperature of the air by passing it over steam coils, to enable it to take up more moisture. Much of this moisture is deposited in the workings as the air current traverses the mine. The distribution of salt in mine workings has been found very efficient for keeping the dust in a moist condition. A good plan is to mix the salt with the stemming used to tamp the holes in blasting.

QUESTION—*What are the duties of a mine foreman when he arrives at the mine in the morning?*

ANSWER—On his arrival at the mine in the morning, the first duty of the mine foreman is to assure himself that the engineer, firemen and other top hands are in their places and that the ventilating apparatus is working properly. On entering the mine, he must examine and sign the fireboss' report and learn from him the general condition of the mine. The foreman should receive from the fireboss and hold the checks of men working in places where danger has been found. He must arrange to have these dangers removed and the places made safe, as quickly as possible. No one must be allowed to enter such places, however, until the places have been again examined and found safe for work. The foreman should then see that the work of hauling and hoisting coal is proceeding and arrange for any needed supplies of timber, rails and tracking so as to avoid unnecessary delay.

QUESTION—*Compute the horsepower of an engine 18x36 in., with 110 lb. steam pressure.*

ANSWER—The sectional area of the cylinder of this engine is $0.7854 \times 18^2 = 254.47$ sq.in. Operating under a gage pressure of 110 lb. per sq.in. and assuming a two-thirds cutoff, the mean effective steam pressure in the cylinder may be taken as 88 lb. per sq.in.; and the total pressure on the piston is, then, $88 \times 254.47 = 22{,}394$ lb. Again, assuming a piston speed of 600 ft. per min., the indicated horsepower of this engine is $(22{,}394 \times 600) \div 33{,}000 = 407$ hp.

QUESTION—*What weight can be lifted by an 18x36 in. engine, operating under a gage pressure of 110 lb. per sq.in., the engine being direct connected to a 6-ft. drum?*

ANSWER—Estimating the lifting power of the engine under the full steam pressure, gives for the force exerted on the piston $110(0.7854 \times 18^2) = 27{,}991.7$, say 28,000 lb. or 14 tons. This engine having a stroke of 36 in., the length of the crankshaft is 18 in., which is one-half the radius of the drum. Approximately, the moment of the steam pressure, acting at right angles to the crankshaft, is equal to the moment of the load acting on the radius of the drum. Therefore, the lifting power of the engine, in this case, is $(2 \times 18) \div 36 = 1$ ton.

QUESTION—*In a mine giving off 2,250 cu.ft. of marsh gas per minute, the volume of air entering the mine being 70,000 cu.ft. per min., what is the percentage of gas in the air current at the outlet?*

ANSWER—In answering this question, allowance should be made for the change in temperature and volume from the intake or entrance of the mine, where the air is measured, to the outlet where the air is discharged. However, assuming a constant temperature in this case, and ignoring the change of volume due to the release of the ventilating pressure at the outlet, the total volume of air and gas passing out of the mine is 72,250 cu.ft. per min. The percentage of gas in this current is then $(2{,}250 \times 100) \div 72{,}250 = 3.114$ per cent.

What Happened in the Coal Industry in 1922

(Continued from last week)

July *(Continued)*

July 17—Sheriff and five non-union men killed and many wounded in attack of 300 men on Richland Mining Co.'s Clifton Mine at Cliftonville, W. Va. (Vol. 22, No. 3, p. 105).

July 17—Coal shortage seems to have arrived. Average price climbs from $3.64 to $3.89 in a week. Western Kentucky jumps $1 to $6.25. Rail congestion increases. Northwest begins to take freight with stocks lowered by shipments back down the lake and by heavy demand (Vol. 22, No. 3, p. 107).

July 18—Many operators regret President called his futile conference just now for union was on point of surrender (Vol. 22, No. 4, p. 142).

July 18—President Harding wires Governor of 28 coal states to invite operators and miners to go back to work and to guarantee protection to those men willing to work. Governors of 26 states accept, but Gov. Ritchie of Maryland and Gov. Morrison of North Carolina decline (Vol. 22, No. 4, p. 139).

July 19—Campaign of frightfulness in West Virginia unearthed by state officials. Dynamiting of train of miners in Boone county only one evidence of it (Vol. 22, No. 4, p. 144).

July 20—Eleven hundred Pennsylvania troops go on duty throughout Washington, Westmoreland, Somerset, Indiana and Cambria counties (Vol. 22, No. 4, p. 143).

July 20—Pittsburgh operators post "Washington" scale of 1917 to be in effect they say to Jan. 1, 1923. Few go back to work under it (Vol. 22, No. 4, p. 138).

July 20—President Harding replies to Governor Spraul of Pennsylvania that he "may expect selection of a commission. . . . in due time" though its form must differ from that originally planned (Vol. 22, No. 4, p. 140).

July 22—Southwestern Interstate Association urges Lewis and district presidents in its field to enter into district wage negotiations at once in spite of refusals of miners on March 29 and April 10 (Vol. 22, No. 4, p. 140).

July 23—President Ogle of National Coal Association wires President Harding urging appointment of non-partisans fact-finding commission at once (Vol. 22, No. 4, p. 140).

July 24—Attorney-General Daugherty declares as legal the government's plan for distributing cars only to those operators who conform to Hoover fair prices (Vol. 22, No. 4, p. 141).

July 24—Government's tentative plan for price control and regulation of distribution calls for Presidential committee in Washington, and administrative committee of operators, railways, etc., to help carry out plan of distributing cars only to those who conform to Hoover prices and to help carry out I. C. C. preferential coal orders. Attorney-General says plan is legal. Operators go home to choose district committee to serve Presidential committee (Vol. 22, No. 4, p. 141).

July 24—Attorney-General Daugherty after investigation is "unable to say" whether relationship between coal and rail strikes is conspired or inspired (Vol. 22, No. 4, p. 143).

July 24—Operators of Southwestern Interstate District indorse Harding plan for resumption of mining (Vol. 22, No. 5, p. 182).

July 24—Coal prices roll upward jumping in a week from average of $3.89 to $5.56. Western Kentucky hops up $1 a day to $11@$12. Majority of coal, however, stays at Hoover level. Rail paralysis largely responsible for sensational market rise (Vol. 22, No. 4, p. 145).

July 25—White House announces it has offered to miners and operators strike settlement plan containing guarantee of minimum wage and 280 days work annually to miners (Vol. 22, No. 4, p. 141).

July 25—Senator Borah introduces bill for commission of three at $8,000 a year each to report on advisability of nationalizing mines (Vol. 22, No. 5, p. 180).

July 25—Biggest Kentucky mine merger in years unites Log Mountain and Yellow Creek Coal Co.'s with Hignite and Bennett Fork Coal Mining Co.'s and Mingo Coal and Coke Co. (Vol. 22, No. 5, p. 176).

July 26—I. C. C. issues first priority order Service Order 23, as follows: Cars to be supplied (1) for special purposes assigned by Commission, (2) public utilities, U. S. state and city governments, railroads, (3) lake traffic, (4) railroad domestic shipment, (5) all others (Vol. 22, No. 4, p. 141).

July 28—Joint arbitration board restores 1920 scale in Kentucky-Tennessee district (Vol. 22, No. 6, p. 223).

July 28—First organization of Connellsville coal operators is formed as adjunct to government price control committee. It is the Fayette-Greene Coal Operators' Association (Vol. 22, No. 5, p. 179).

July 29—President Farrington of Illinois union district calls state convention to discuss state negotiations (Vol. 22, No. 5, p. 179).

July 29—President Harding induces Borah to stay action on the Senator's coal commission bill (Vol. 22, No. 5, p. 180).

July 29—Injunctions against unions issued by Judge McClintic in West Virginia are upheld by U. S. Circuit Court of Appeals at Richmond, Va. (Vol. 22, No. 5, p. 182).

July 29—Michigan miners refuse to heed Gov. Groesbeck's request that they go back to work (Vol. 22, No. 5, p. 182).

July 30—Generally agreed now that Hoover price agreement has broken down because some fields refuse to subscribe to it (Vol. 22, No. 6, p. 217).

July 30—President Farrington of Illinois miners calls off his state convention saying "too much publicity" killed it (Vol. 22, No. 5, p. 179).

July 31—Coal market reaches peak of 1922 with an average spot price of $6.73 (Vol. 22, No. 5, p. 183).

August

Aug. 1—E. A. Holbrook, assistant director of U. S. Bureau of Mines, becomes dean of Pennsylvania State College school of mines (Vol. 22, No. 7, p. 254).

Aug. 1—Henry B. Spencer, administration member of the President's committee on car distribution, opens Washington offices and begins work (Vol. 22, No. 5, p. 177).

Aug. 1—President Lewis of the miners invites operators of Central Competitive Field to Cleveland Conference Aug. 7. Says miners will not have to take wage cut and that mines will be working in a week or so (Vol. 22, No. 7, p. 257).

Aug. 3—Southern Ohio operators decline to attend Lewis' Cleveland conference of Aug. 7 (Vol. 22, No. 6, p. 219).

Aug. 4—Fuel Distributor Spencer organizes his operators committees in each district directed by Naval officer (Vol. 22, No. 6, p. 213).

Aug. 4—Illinois operators offer their miners last year's scale until March 31, 1923, if they will arbitrate new scale. Farrington says he cannot answer until Cleveland conference is over (Vol. 22, No. 6, p. 215).

Aug. 7—Cleveland conference called by Lewis draws small percentage of Central Competitive Field Tonnage. Adjourns quickly to give new "Crews-Glasgow plan" a chance to bring in more operators. Michael Gallagher of Northeastern Ohio is chairman (Vol. 22, No. 6, p. 220).

Aug. 8—Sections of the nation that feel coal shortage are beginning to appeal loudly to Distributor Spencer. Northwest is loudest of all (Vol. 22, No. 6, p. 217).

Aug. 9—Illinois operators send delegation to Toledo to meet special emissaries from Cleveland Conference. They agree on nothing (Vol. 22, No. 7, p. 255).

Aug. 10—Federal Fuel Committee agrees to see that Lakes shipping gets 250,000 tons of coal per week for Northwest (Vol. 22, No. 7, p. 253).

Aug. 11—Illinois operators in session for four days at Chicago finally decline to go to Cleveland because Lewis will not consider arbitration. They give out President Harding's letter endorsing their proposal that Illinois men resume at old scale (Vol. 22, No. 7, p. 255).

Aug. 11—After four days of treadmilling in Cleveland conference miners eject all operators from outside Central Competitive Field and go on holding futile sessions (Vol. 22, No. 7, p. 257).

Aug. 12—Henry Ford's proposal to man Corbin (Ky.) shops of L. & N. with his men and open up the railroad "bottleneck" for coal traffic is rejected as "unthinkable" by President Maypother of L. & N. (Vol. 22, No. 7, p. 256).

Aug. 12—Operators and miners meet separately at Cleveland. Obviously something is wrong. Lewis and Gallagher issue joint statement saying the conference "is in no sense a four-state" one (Vol. 22, No. 7, p. 258).

Aug. 14—Comparative peace prevails in National Coal Assn. meeting in New York though President Ogle is criticized for dabbling in labor problems as head of the association. (Vol. 22, No. 7, p. 260).

Aug. 14—Cleveland conference takes sudden new turn. T. H. Watkins of Central Pennsylvania is admitted with modified crews. Glasgow plan and Gallagher and S. H. Robbins withdraw (Vol. 22, No. 7, p. 257).

Aug. 15—Coal strike is broken, when Lewis in Cleveland conference signs up individually or by groups about 40,000,000 tons represented. Agreement provides for fall conferences on future methods of negotiations. Many regions decline to sign (Vol. 22, No. 7, p. 257).

Aug. 15—Most Nova Scotia mines closed by strike of miners who refuse to accept settlement made by their officers (Vol. 22, No. 7, p. 259).

Aug. 15—Second week in August sees only 147,000 tons of coal go into Lake carriers instead of 250,000. Hoover says "it is impracticable to continue price control on a voluntary basis" and said it could only be done by law. (Vol. 22, No. 7, p. 260).

Aug. 16—Many West Virginia non-union fields advance pay to levels high enough to keep labor from leaving for union mines (Vol. 22, No. 10, p. 370).

Aug. 17—Anthracite operators and miners at request of President Harding begin negotiations at New York but get nowhere in a week because miners insist upon two-year contract (Vol. 22, No. 9, p. 331).

Aug. 17—First break among northern West Virginia operators comes when Consolidation Coal Co. and 50 others sign Cleveland agreement (Vol. 22, No. 8, p. 298).

Aug. 18—President Harding in message to Congress asking fuel distribution power says of Cleveland strike settlement: "The simple and significant truth was revealed that except for such coal as comes from the non-union districts, the country is at the mercy of the United Mine Workers." (Vol. 22, No. 7, p. 273).

Aug. 18—I.C.C. cancels wartime assigned car rule. (Vol. 22, No. 8, p. 296).

Aug. 20—Nova Scotian miners' district ousts President Robt. Baxter and elects Dan Livingstone. Baxter was charged with "selling out" union in agreement membership repudiated. (Vol. 22, No. 10, p. 368).

Aug. 21—Hoover prices in West Virginia, Kentucky and Tennessee are raised from $3.50 to $4.50. Hoover in message to Gov. Davis of Ohio foreshadows government price control over

union mines as they reopen (Vol. 22, No. 8, p. 292).

Aug. 22—Illinois signs agreement with miners after five days of conference. Terms are those of Cleveland except operators do not agree to take part in Lewis conferences on wage making machinery (Vol. 22, No. 8, p. 297).

Aug. 22—Borah and Winslow bills in Senate and House are reported. Each provides a form of government fact-finding commission (Vol. 22, No. 8, p. 295).

Aug. 22—Indiana operators sign but do not "endorse" Cleveland agreement (Vol. 22, No. 8, p. 298).

Aug. 23—Strictly union part of Central Pennsylvania field sign same contract that Pennsylvania Coal & Coke Co. and Clearfield Coal Corp. signed at Cleveland Aug. 15 (Vol. 22, No. 9, p. 332).

Aug. 23—Connellsville coke region and New River region raise wages to 1920 level to hold labor from going back to union mines (Vol. 22, No. 9, p. 332).

Aug. 23—Southwest signs Cleveland agreement (Vol. 22, No. 9, p. 336).

Aug. 24—Operators in British Columbia and Alberta sign agreement on scale 15 per cent under that of 1921 to resume work Aug. 28 (Vol. 22, No. 9, p. 332).

Aug. 24—Senator Cummins and Rep. Winslow file bills for price control through distribution of cars. Secretary Hoover favors Winslow bill (Vol. 22, No. 9, p. 335).

Aug. 25—British Empire Steel Corp. in Nova Scotia finally settles strike by raising pay 60 cents to $3.25 a day and contract rates 12½ per cent (Vol. 22, No. 10, p. 368).

Aug. 26—About 150 operators of northern West Virginia have ratified Cleveland pact to date (Vol. 22, No. 10, p. 372).

Aug. 27—Francis S. Peabody, operator, dies suddenly at home near Chicago (Vol. 22, No. 9, p. 336).

Aug. 28—Pocahontas field raises scale to 1920 level effective Aug. 15 (Vol. 22, No. 10, p. 370).

Aug. 28—Grand Jury on Herrin case convenes (Vol. 22, No. 9, p. 334).

Aug. 28-29—Special session of New York Legislature passes bill creating office of fuel administrator and giving state certain price control. The act creates revolving fund of ten million dollars for state to buy fuel and sell it to the people (Vol. 22, No. 9, p. 336).

Aug. 29—Anthracite miners and operators resume conference this time at Washington (Vol. 22, No. 10, p. 373).

Aug. 29—I.C.C. amends service order 23 to put Lake coal into Class 1 in priority list (Vol. 22, No. 10, p. 370).

Aug. 29—Pittsburgh Coal Producers' Assn. minus the Pittsburgh Coal Co., signs Cleveland agreement (Vol. 22, No. 10, p. 368).

Aug. 30—Pittsburgh Coal Co. last to succumb, signs Cleveland agreement (Vol. 22, No. 10, p. 368).

Aug. 30—Herrin grand jury indicts Otis Clark, mine union official, and he is arrested as first prisoner in massacre case (Vol. 22, No. 10, p. 372).

Aug. 30—Explosion in No. 4 mine of Canadian Collieries Co. at Cumberland, B. C., kills 15, of whom 12 are orientals, and injures 16. Cause is unknown. (Vol. 22, No. 10, p. 369).

Aug. 31—Anthracite operators say they will sign on miners' terms but only to Sept. 1, 1923, if they get "mandate from the public" (Vol. 22, No. 10, p. 373).

Aug. 31—House passes, 214 to 61, Winslow bill to control coal prices by car control and to aid in coal distribution (Vol. 22, No. 10, p. 370).

September

Sept. 1—Illinois operators' trade associations dissolve and private statistical organizations take their places (Vol. 22, No. 13, p. 504).

Sept. 1—U. S. Steel Corporation advances wages 20 per cent (Vol. 22, No. 9, p. 336).

Sept. 1—Alabama increases wages 20 per cent (Vol. 22, No. 9, p. 332).

Sept. 1—Western Kentucky signs new agreement to run to April, 1923. They worked through the summer on a non-strike agreement with the union (Vol. 22, No. 10, p. 369).

Sept. 2—Anthracite miners and operators in Philadelphia again make tentative agreement to be ratified by miners (Vol. 22, No. 10, p. 373).

Sept. 7—Coronado Coal Co. et als petition U. S. Supreme Court for rehearing on Coronado case (Vol. 22, No. 11, p. 418).

Sept. 7—Senate passes Cummins price control bill, 40 to 7 (Vol. 22, No. 11, p. 421).

Sept. 7—Herrin grand jury indicts 37 more for June 22 massacre (Vol. 22, No. 11, p. 423).

Sept. 8—Herrin grand jury adds 21 more indictments to its list (Vol. 22, No. 11, p. 423).

Sept. 8—Senate passes Borah fact-finding commission bill, without a roll call (Vol. 22, No. 11, p. 421).

Sept. 8—New York State Coal Merchants' Assn. recedes from previous position and votes to support government price control program (Vol. 22, No. 11, p. 422).

Sept. 11—Anthracite mines resume work. Operators and miners sign at noon in Scranton, contract at "war wages" running to Sept. 1, 1923 (Vol. 22, No. 11, p. 425).

Sept. 13—Ohio legislature in special session passes drastic coal act creating fuel administrator office with much price power. State is empowered to seize mines if necessary (Vol. 22, No. 12, p. 460).

Sept. 15—Secretary Hoover holds important conference with leading commercial interests on coal distribution to get co-operation on coming government distribution control (Vol. 22, No. 12, p. 467).

Sept. 15—National Assn. of Purchasing Agents adopts policy of co-operating with Hoover (Vol. 22, No. 14, p. 555).

Sept. 15—C. J. Neal is named fuel administrator for Ohio (Vol. 22, No. 13, p. 507).

Sept. 16—Winslow price control bill passes Senate and goes to President Harding for signature (Vol. 22, No. 12, p. 461).

Sept. 16—"Guilty of treason" is jury's finding at Charlestown, W. Va., against Walter Allen, accused of being one of the marchers on the non-union coal fields of Logan and Mingo counties in September, 1921 (Vol. 22, No. 12, p. 466).

Sept. 19—I.C.C. amends S. O. 23 and 24 with S. O. 25 shifting its policy from priorities on coal cars to a broader priority on coal transportation (Vol. 22, No. 13, p. 507).

Sept. 20—Col. L. E. Tierney, officer in Crozer, Pocahontas, Powhattan Coal & Coke, and other companies, dies at home in Powhattan, W. Va. (Vol. 22, No. 13, p. 507).

Sept. 21—John G. Smith, general manager for the Consolidation Coal Co. at Jenkins, Ky., is killed by fall of slate (Vol. 22, No. 13, p. 510).

Sept. 22—Fact-finding commission bill, a compromise in committee, passes and is enacted into law (Vol. 22, No. 13, p. 503).

Sept. 22—President Harding signs coal distribution bill and appoints Conrod E. Spens fuel distributor (Vol. 22, No. 13, p. 505).

Sept. 23—Herrin grand jury brings in enough more indictments to make total 214 and makes fearless report on massacre of June 22. Attorney for union declares the case is "persecution of labor by capital" (Vol. 22, No. 13, p. 509).

Sept. 27—Fuel Distributor Spens orders daily reports on kind, amount, and price of soft coal shipped and to whom sent. Business men's committee named to assist Spens (Vol. 22, No. 14, p. 558).

Sept. 28—Injunction againt union interference at mines of Bethlehem Mines Corporation is made permanent by Judge Langham (Vol. 22, No. 14, p. 555).

Sept. 30—Mine union wins a point in Herrin defence by getting trial of 8 men charged with murder of Howard Hoffman ordered first. State wanted to prosecute Otis Clark, union official, first (Vol. 22, No. 14, p. 556).

October

Oct. 1—Lake sailors strike but most coal vessels manage to move anyway (Vol. 22, No. 15, p. 602).

Oct. 1—J. D. A. Morrow, secretary, and John Callahan, traffic manager, of the National Coal Assn. resign to open jobbing business (Vol. 22, No. 15, p. 601).

Oct. 1—Western Fuel Corp. of Canada signs 2-year contract with men. Minimum wage is $4.25¼ (Vol. 22, No. 14, p. 560).

Oct. 1—Pennsylvania Fair Practice committee is created with Edgar F. Felton as chairman to help control anthracite prices (Vol. 22, No. 14, p 561).

Oct. 1—U. S. 1921 total bituminous output was 415,921,000 tons, U. S. Geological Survey announces (Vol. 22, No. 14, p. 553).

Oct. 2—H. M. Sipe, of Clarksburg, W. Va., sues union for $50,000 for refusing to sign contract for a mine taken over from Hudson Coal Co., an open shop organization (Vol. 22, No. 16, p. 658).

Oct. 2—Practically every bituminous union district represented at Cleveland miner-operator conference. T. F. Maher is made temporary chairman. Conference adjourns until next day and operators wrangle all afternoon (Vol. 22, No. 14, p. 559).

Oct. 3—Cleveland conference hears pacific speech by John Lewis advising both sides to "bury the hatchet." Operators give up plan of sending separate list of names for fact-finding commission to Washington. Miners give up plan for joint fact-finding commission (Vol. 22, No. 14, p. 559).

Oct. 4—Cleveland conference winds up peacefully. Appoints "reorganization" committee of two miners and two operators from each district to meet Nov. 14 and try to work out future method of negotiation. Miners send 10 names of suggested "fact-finders" to Washington (Vol. 22, No. 15, p. 597).

Oct. 4—Immediately after the "peace conference" in Cleveland miners announce they will demand continuance of existing scale after April 1, 1923, together with all the Indianapolis demands written at union convention (Vol. 22, No. 15, p. 599).

Oct. 4—Fuel Distributor Spens simplifies his order No. 1 so that consignees and car numbers are omitted from daily reports from shippers (Vol. 22, No. 15, p. 599).

Oct. 7—Martial law in Mingo County, W. Va., raised after 15 months following Logan County "march" and attack by union army of 6,000 (Vol. 22, No. 16, p. 640).

Oct. 9—U. S. Supreme Court denies petition for rehearing of Coronado Coal Co. case (Vol. 22, No. 16, p. 646).

Oct. 9—For murder of Sheriff Duvall and five others at Cliftonville mine July 17, 218 union miners go on trial charged with murder, etc. (Vol. 22, No. 16, p. 640).

Oct. 9-14—American Mining Congress at Cleveland discusses various phases of coal in annual convention and exposition (Vol. 22, No. 15, p. 603).

Oct. 10—President appoints to Federal Coal Commission John Hays Hammond, chairman, Thomas Riley Marshall, Clark Howell, Dr. Edward T. Devine, Judge Samuel Alschuler, Charles P. Neill and George Otis Smith (Vol. 22, No. 16, p. 619).

Oct. 10—Ohio's maximum price list goes into effect fixing prices at $3.56 to $4.86 at mines (Vol. 22, No. 15, p. 601).

Oct. 10—Michigan legislature convenes in special session to consider Gov. Groesbeck's plan of price control. Senate excludes wood and oil and cuts off appropriation for administrator (Vol. 22, No. 16, p. 645).

Oct. 14—Smokeless maximum price of $6 a ton agreed to by 80 per cent of operators, Fuel Distributor Spens says (Vol. 22, No. 16, p. 643).

Oct. 15—Consolidation of Indiana Bituminous Coal Operators Assn. and Indiana Coal Producers' Assn. of strip miners effected (Vol. 22, No. 16, p. 657).

Oct. 16—Fuel Administrator's organization begins investigating independent anthracite operators selling above $9.25 (Vol. 22, No. 16, p. 643).

Oct. 18—Federal Coal Commission organizes and decides to invite John Lewis, Alfred Ogle of the National Coal Assn., and S. D. Warriner, a leading anthracite operator, to name advisory committees to aid the commission (Vol. 22, No. 17, p. 681).

Oct. 23—Herrin grand jury completes its work by indicting 48 more men for murder at Lester strip mine June 22 (Vol. 22, No. 17, p. 686).

Oct. 27—Union officially calls off strike in Mingo County, W. Va., and moves many tented miners to union fields. In 28 months of this strike 30 men have been killed, 50 wounded, much property destroyed by fire and dynamite and the effort cost union $2,000,000 (Vol. 22, No. 18, p. 727).

November

Nov. 1—Stocks on hand Sept. 1 were 22,000,000 tons and 28,000,000 tons on Oct. 1 in the hands of commercial consumers, Geological Survey announces (Vol. 22, No. 19, p. 765).

Nov. 2—Northern West Virginia agrees with Fuel Distributor Spens to reduce domestic sizes from $5.50@$5.75 to a maximum of $4.50 (Vol. 22, No. 19, p. 767).

Nov. 4—Railroads offer complete cooperation with Federal Coal Commission (Vol. 22, No. 21, p. 846).

Nov. 5—Citizens of Olyphant, Pa., seize two cars of anthracite belonging to Hudson Coal Co., and use it for schools, claiming Temple Fuel Co. would not fill schools' order. Company protests in vain to state (Vol. 22, No. 21, p. 861).

Nov. 6—Illinois and Indiana producers decline to reduce domestic lump from $5.50 to Hoover level of $4 suggested by Fuel Distributor Spens (Vol. 22, No. 19, p. 767).

Nov. 6—Explosion in Reilly mine at Spangler, Pa., entombs 95 miners (Vol. 22, No. 19, p. 767).

Nov. 10—Kentucky guardsmen are removed from Hopkins County (Vol. 22, No. 21, p. 859).

Nov. 13—Coal shortage in the South causes Fuel Administration to order railroads to supply L. & N. with 4,000 cars at once. Governors of six southern states consider relief methods in Nov. 15 conference (Vol. 22, No. 21, p. 844).

Nov. 13-14—Kohler mine-cave law is attacked before Supreme Court by northeast states' attorneys-general and others, including John W. Davis, former ambassador to England. Main contention is that the law is unconstitutional (Vol. 22, No. 21, p. 846).

Nov. 14-16—Sub-committee of two operators and two miners from each of 15 districts fail in Chicago to agree upon any method of future negotiations. Adjourned to Dec. 6 giving indications that eventually the four-state plan would be re-established. Outlying districts led by Harry N. Taylor of Kansas City and C. H. Jenkins, of Fairmont, proposed plans for national negotiations without success (Vol. 22, No. 21, p. 843-4).

Nov. 15—Strike settlement in San Juan valley of Colorado is finally made, miners to get 1921 scale (Vol. 22, No. 21, p. 859).

Nov. 18—Anthracite operators submit suggestions to U. S. Coal Commission pledging co-operation in collecting data (Vol. 22, No. 21, p. 845-6).

Nov. 20—Retail margins on coal in Ohio are increased an average of 25 cents a ton in cities and 8 cents in towns (Vol. 22, No. 21, p. 846).

Nov. 22—Jury finds Spangler explosion was due to too few firebosses, use of open lights, and bad ventilation (Vol. 22, No. 22, p. 888).

Nov. 22—Runaway trip at Dolomite mine, Dolomite, Ala., causes terriffic dust explosion, killing 86 and injuring 59 besides damaging stope and bottom and burning wood parts of tipple (Vol. 22, No. 21, p. 877).

Nov. 24—Illinois operators instruct their two men on national sub-committee on wage negotiating methods to favor four-state or district plans at Dec. 6 meeting of the sub-committee (Vol. 22, No. 22, p. 890).

Nov. 24—Miners will not accept any wage cut next spring, Ellis Searles, publicitor for U. M. W. of A., tells Business Science Club of Philadelphia (Vol. 22, No. 22, p. 869).

Nov. 25—I.C.C. seems impressed with bulk of evidence submitted to it against assigned car practice for Service Order 26 says such cars "shall be counted against the distributive share alloted to the mines" (Vol. 22, No. 22, p. 886).

Nov. 26—First dynamiting in Connellsville region wrecks two-family house and hurts two men (Vol. 22, No. 23, p. 925).

Nov. 27—U. S. Supreme Court holds Pennsylvania anthracite tax law constitutional (Vol. 22, No. 22, p. 888).

Nov. 28—Both American Mining Congress, Western Pennsylvania coal operators and American Railway Assn., organize special committees to aid federal coal commission (Vol. 22, No. 23, p. 927).

December

Dec. 1—Ohio fuel administration disbands because "The emergency is over" (Vol. 22, No. 23, p. 928).

Dec. 1—John D. Battle becomes traffic manager of the National Coal Assn. (Vol. 22, No. 21, p. 848).

Dec. 4—Indiana operators refuse to check off $4 special assessment for national union (Vol. 22, No. 24, p. 968).

Dec. 5—American Wholesale Coal Assn. men tell the S. Coal Commission of the valuable service the wholesaler renders the industry (Vol. 22, No. 24, p. 966).

Dec. 6—Miners in "reorganization" committees' final session in Chicago reject plan operators had worked out Dec. 4 and 5 for separate district agreements, so the committee's efforts to devise method for future wage negotiation end in failure (Vol. 22, No. 24, p. 963).

Dec. 8—Illinois operators in 5th and 9th districts agree not to sell domestic coal for more than $4.50, Federal Fuel Distributor Spens announces (Vol. 22, No. 24, p. 965).

Dec. 9—John Hessler, Indiana union president, serves notice of strike if $4 assessment for national union is not checked off (Vol. 22, No. 24, p. 968).

Dec. 10—Bituminous coal industry is overdeveloped 30 to 60 per cent, U. S. Coal Commission's studies indicate, according to informal statement (Vol. 22, No. 24, p. 966).

Dec. 11—I.C.C. rescind open top car restrictions and priorities (Vol. 22, No. 24, p. 968).

Dec. 11—U. S. Supreme Court decides Kohler Act—known as "the cave-in law"—is unconstitutional. This act forbade mining under habitations (Vol. 22, No. 24, p. 968).

Dec. 11—I.C.C. dismisses complaints of Bell & Zoller Coal Co. vs. B. & O. Railroad of irregularity in car distribution, deciding against joint mines and limiting car supply to 100 per cent (Vol. 22, No. 25, p. 1005).

Dec. 11—John Hays Hammond tells newspaper men U. S. Coal Commission has no intention of arbitrating the bituminous wage dispute (Vol. 22, No. 24, p. 967).

Dec. 11—Subpenas are issued by U. S. Coal Commission for retail coal dealers to tell of anthracite prices (Vol. 22, No. 24, p. 967).

Dec. 13—United Mine Workers urge U. S. Coal Commission to probe Logan County, W. Va., conditions where the union claims oppression is being visited on unions (Vol. 22, No. 25, p. 1007).

Dec. 13—Indiana operators surrender to union and agree, to check off $4 special assessment for the national union organization (Vol. 22, No. 25, p. 1006).

Dec. 13-15—Coal Mining Institute of America meets at Pittsburgh, Pa. (Vol. 22, No. 25, p. 997).

Dec. 14—Smokeless Operators' Assn. elects R. H. Gross of Boston its president (Vol. 22, No. 25, p. 1004).

Dec. 15—Frank Farrington is announced re-elected to presidency of Illinois miners' union (Vol. 22, No. 25, p. 1009).

Dec. 16—Witnesses during week in Herrin massacre identify all five prisoners on trial for Howard Hoffman's murder June 22 (Vol. 22, No. 25, p. 1004).

Dec. 20—I.C.C. makes tentative report favoring much revision and equalizing of freight rates from coal fields of Rocky Mountain states (Vol. 22, No. 26, p. 1049).

Dec. 26—Falling market is bolstered, as year closes, by railroad incapacity to handle coal traffic and bituminous average price rises in a week from $4.07 to $4.23 (Vol. 22, No. 26, p. 1051).

Average Spot Prices of Bituminous Coal, F.o.b. Mines

(Unit net ton of 2,000l bs.)

Month	1913	1914	1915	1916	1917	1918	1919	1920	1921	1922
Jan.	$1.46	$1.21	$1.13	$1.53	$4.15	$2.48	$2.57	$2.57	$3.26	$2.26
Feb.	1.22	1.16	1.12	1.40	4.18	2.53	2.49	2.58	2.77	2.20
March	1.17	1.17	1.09	1.27	3.89	2.58	2.47	2.58	2.63	2.12

Many Strikes Curtail Output of Canadian Mines

Production in 1922 Falls Behind Two Preceding Years—Besides Great Strike There Were Eleven Smaller Ones—Imports from Great Britain for the First Time in Years—874,000 Tons Received

By S. J. Cook*

THE output from Canadian mines during 1922 was approximately 14,210,000 tons, as compared with 15,057,493 tons in 1921, 16,946,764 tons in 1920 and 13,919,096 tons in 1919. The great strike which tied up the United States coal mines for several months was reflected in Canada and resulted in a loss of 1,199,427 working days. Eleven disputes between employees and employers occurred in Canada during the eleven months ending November, nine of which were in Alberta and southeastern British Columbia and the other two in Nova Scotia.

In all, 23,901 men were affected, and of the time lost, 931,960 days were lost in the strike which began on April 1, and 260,034 days' time was lost in the short strikes originating in August. Alberta's output amounted to 5,387,000 tons, a little more than half of which was lignite. Nova Scotia contributed 5,349,000 tons and occupied second place among the coal-producing provinces. British Columbia accounted for 2,936,000 tons, and New Brunswick and Saskatchewan followed with 287,000 tons and 250,000 tons respectively.

Exports of Canadian coal were 1,821,000 tons in 1922, about 1,000,000 tons from the Western provinces and the balance from the maritime provinces, a decrease of about 160,000 tons from 1921. The exports during 1920 were 2,538,000 tons, and in 1919 amounted to about 2,000,000 tons.

For the first time in many years quantities of coal were imported from Great Britain. In all, about 874,000 tons was received, 710,000 tons of which was bituminous and 164,000 tons of which was entered as anthracite. The receipts at customs ports in Quebec of this coal from Great Britain amounted

*Chief of the Mining, Metallurgical and Chemical Branch, Dominion Bureau of Statistics, Ottawa, Canada.

to 812,000 tons during the year, while New Brunswick received 47,000 tons and the balance was equally divided between Ontario and Nova Scotia. Imports of coal from the United States amounted in all to 13,937,000 tons, comprising 11,255,000 tons of bituminous coal and 2,683,000 tons of anthracite. As compared with the records for the preceding year, imports of bituminous coal were 2,300,000 tons lower, and imports of anthracite were 1,885,000 tons less.

For the whole of Canada the apparent consumption, or more properly, the coal made available for consumption in 1922 amounted to 27,200,000 tons, including 21,228,000 tons of bituminous coal, 3,083,000 tons of lignite and 2,888,000 tons of anthracite. The principal coal-consuming province was central Ontario, in which 9,849,000 tons was made available, including 1,716,000 tons of anthracite. In 1921 the same area was supplied with 11,543,000 tons and in 1920 with 13,331,000 tons. For Quebec 4,450,000 tons of coal was made available in 1922, as compared with 4,898,000 tons in 1921 and 5,327,000 tons in 1920.

In 1920 Canada produced 16,900,000 tons, exported 2,500,000 tons, imported 20,800,000 tons, and thus apparently consumed 35,200,000 tons. In 1921, when the output was 15,000,000 tons, the quantity exported amounted to 1,900,000 tons, imports to 18,100,000 tons, and the apparent consumption was 31,100,000 tons. The decline in the consumption of coal in 1921 was in conformity with the prevalent depression in the industrial world. For 1922 the output was 14,200,000 tons, the exports 1,800,000 tons, the imports 13,900,000 tons from the United States and 800,000 tons from Great Britain. The decrease in every item was due to strikes.

U. M. W. Committee Says District 26 Must Withdraw from Red International

By adopting a report of a committee appointed to investigate, the United Mine Workers of America has taken a positive stand against the Red International of Moscow and its attempt to "destroy the American legitimate labor movement and substitute therefor the principles of Bolshevism."

The investigation was made as the result of an inquiry by the district organization of the union in Nova Scotia, otherwise known as District No. 26, as to the right of that district to effect an affiliation with the International of Moscow.

The report of the committee states that the Red International is an organization similar in character to the "One Big Union," which existed in the northwestern provinces of Canada in 1918. Its program and policies are so shaped that it not only sanctions but in fact urges the workers to street uprisings, mob demonstrations, violence, or any other method that it may deem expedient for the accomplishment of its purpose.

Dealing with the question of collective bargaining the committee quotes section 54 of the Red International program and then says:

"It must be apparent to all who read and think that this program is in contravention to the policies, customs, practices and laws of the United Mine Workers of America. The membership of our great organization not only believe in the principle of collective bargaining but also the sanctity of contracts honorably entered into between the representatives of the United Mine Workers of America and the coal operators. In fact this is the rock upon which our union was founded, and in the practice of this policy we have not only made substantial gains in members but we have also strengthened our organization in power and influence."

After stating that the constitution of the United Mine Workers of America excludes from its membership roll and also provides other penalties for those members holding membership in a dual organization not affiliated with the American Federation of Labor, the report states that the Red International is, in the estimation of the American Federation of Labor, a dual organization.

"Therefore," continues the report, "in accordance with the provisions of Sec. 2, Art. 14, those of our members holding membership in the Red International will be required to pay the penalty provided in this section, which reads as follows:

Mine managers, top foremen, operators' commissioners, persons engaged in the sale of intoxicating liquors and members of the Civic Federation shall not be eligible for membership.

Any member accepting membership in the Industrial Workers of the World, the Working Class Union, the One Big Union, or any other dual organization not affiliated with the American Federation of Labor, or membership in the National Chamber of Commerce, or the Ku Klux Klan, shall be expelled from the United Mine Workers of America, and is permanently debarred from holding office in the United Mine Workers of America, and no members of any such organization shall be permitted to have membership in our union unless they forfeit their membership in the dual organization immediately upon securing membership in the United Mine Workers of America. Any member of the United Mine workers of America who accepts office in any dual organization shall be permanently expelled from the United Mine Workers of America, unless reinstated by the International Executive Board."

The committee expresses regret that anywhere working people can be found so woefully deficient in the knowledge of trade unionism that they will blindly follow the false teaching of the propagators of such movements. It recommends that District No. 26 be required to withdraw its application for affiliation with the Red International, and in the event of refusal, that it be suspended, the International organization assuming control of the district affairs.

I. C. C. Issues Service Orders 36 and 37

Because the Government Fuel Yards, Washington, D. C., have been receiving an inadequate supply of coal the Interstate Commerce Commission on Jan. 17 issued Service Order No. 36, effective Jan. 18, directing the assignment of coal cars for consignment to the government yards as follows: Four cars per day for ten consecutive working days by the Pennsylvania R.R. to the Hagevo Mine of the Emerson & Morgan Coal Mining Corporation, Hagevo, Pa., and to the Hughes No. 2 Mine of C. A. Hughes & Co., Cassandra, Pa.; two cars per day for ten consecutive working days by the Pennsylvania R.R. to Pennsylvania Mine No. 1 of the Pennsylvania Coal & Coke Corporation, Portage, Pa., and to Commercial Mine No. 5 of the Commercial Coal Mining Co., Twin Rocks, Pa.; two cars per day for ten consecutive working days by the Johnstown & Stony Creek R.R. and the B. & O. to Thermal No. 4 Mine of the Moxham Coal Co., Johnstown, Pa.; one car per day for ten consecutive working days by the Pennsylvania R.R. to Pennsylvania Mine No. 15 of the Pennsylvania Coal & Coke Corporation, Beaverdale, Pa., and by the B. & O. to the Helen Mine of the Helen Coal Mining Co., Sommerfield, Pa. The cars are to be counted against the allotment of each mine.

On Jan. 19 the commission issued Service Order 37, directing the Peoria & Pekin Union Ry. to continue with reasonable promptness and diligence to interchange freight traffic between the Minneapolis & St. Louis R.R. and connecting carriers at the regularly established interchange points at and in the vicinity of Peoria, Ill. The P. & P. U. had served notice that it would discontinue this service at midnight Jan. 20, because of inability to collect what it considered a reasonable amount from the lines served.

Ford Said to Be Negotiating for Coal Land In Central Pennsylvania

Negotiations are reported under way which, if concluded, will mean that Henry Ford, automobile manufacturer, of Detroit, Mich., will acquire the entire Eastern holdings of Cosgrove & Co. and some of the firm's subsidiary concerns, which include large coal operations in Cambria and Somerset counties, Pennsylvania. Reported efforts of Mr. Ford to acquire coal holdings in the Pittsburgh district and also in Ohio, Kentucky and West Virginia lend strength to the report that he is attempting to get control of large mining interests in the central Pennsylvania field.

The Cambria Steel Co. has made two shipments of forty cars each to Henry Ford. These are the first of an order for 500 new steel coal cars. Apparently it is Mr. Ford's intention to avert such a move as was made necessary last summer during the strike, when he threatened to close down for three months unless fuel was made available.

United States Coal Commission Issues Supplementary Report

The U. S. Coal Commission issued on Jan. 17 an appendix supplementary to its report submitted to Congress Jan. 15. After reviewing the congressional and state investigations of the coal industry resulting from periodical public dissatisfaction, culminating in the act creating the present Coal Commission, the appendix outlines the purposes of the commission and the progress it has made.

Economic investigations now well under way embrace the compilation by C. E. Lesher, editor of *Coal Age*, of data showing (1) increase in the price of coal and how it compares with the price of other commodities, (2) the spread between mine price and delivered price, showing the level of prices at the mine, delivered to carload buyers and delivered to householders.

Compilation of production costs is proceeding under the direction of David L. Wing assisted by James E. Black and H. S. Plews. Wayne P. Ellis is preparing data on transportation costs, while the investigation of the costs of selling coal at wholesale and retail is progressing under the direction of John W. Adams.

"The investigation of profits over a period of ten years," according to the appendix, "is now being organized by Walter Y. Durand, of the Federal Trade Commission."

Labor investigations, proceeding under the direction of Dr. Joseph H. Willits, include inquiry into wage rates, irregularity of employment, absenteeism and labor turnover, strikes and their causes. The study of earnings, which is being conducted by Miss Anne Bezanson, assisted by Miss France Chalufour, embraces gross and net earnings of each employee, days or hours worked by individual workers and time worked by the mine.

With the co-operation of the Census, Miss Marie L. Obenauer is analyzing census statistics in connection with the commission's investigation of living conditions in mining towns.

Mr. Lesher, as engineer in charge of studies relating to the production, transportation and distribution of coal, is well along in his analysis of irregular operation, overdevelopment and waste of coal. In the various phases of this work Mr. Lesher is being assisted by Mr. Walter, Wayne P. Ellis, H. J. German and C. A. Allen.

In connection with its denial of charges that political patronage is being handed out in the way of clerical positions, the President's Coal Commission has issued a personnel statement giving the exact numbers of its employees in the various classifications. It follows: "The commission's staff as at present constituted includes 56 technical employees and 93 non-technical employees. The members of the technical staff include 4 engineers, 38 investigators, 6 assistant investigators, 7 examiners, 1 mineral geographer. The non-technical employees include 1 secretary, 1 chief clerk and disbursing officer, 1 administrative assistant, 1 confidential clerk, 40 statistical clerks, 11 stenographers, 8 typists, 2 comptometer operators, 7 clerks, 3 calculating machine operators, 1 statistical draftsman, 6 operatives, 1 graphotype operator, 2 file clerks, 3 apprentices and 5 messengers. No member of the commission has a private secretary or messenger."

To Test State Law

Washington, Jan. 22.—The U. S. Supreme Court has granted a writ of certiorari in the appeal of the Central Coal & Coke Co. against Jacob Ocepek and has set the case for hearing Feb. 19. This case involves the validity of the Arkansas state law compelling foreign corporations to accept service and trial in any county of the state where suit may be instituted by a resident of the state.

The company, incorporated in Missouri, has mines in Sebastian County, Arkansas. Ocepek, an employee residing in Sebastian County, brought suit for personal injuries in Lawrence County, which is in another federal district than Sebastian County. Pleas of the corporation to transfer the case to the Federal Court on the ground of diverse citizenship were refused by the State Circuit Court and the State Supreme Court, the latter affirming a judgment for $20,000 awarded Ocepek in the lower court. The corporation insists that the case should have been transferred to the Federal Court and tried under federal laws instead of state laws.

Bill to Enlarge Powers of Coal Commission Favorably Reported to House

Representative Winslow, of Massachusetts, chairman of the House Committee on Interstate Commerce, reported favorably from that committee, Jan. 18, a revised bill, No. 13,882, designed to further extend the powers of the United States Coal Commission. This measure, which is intended to amend the act creating the fact-finding commission, is a substitute for the bill introduced in the House, Dec. 9, last, by Representative Winslow, and in the Senate a few days later by Senator Borah. At that time the measure was known as the Borah-Winslow bill.

The provisions contained in the law creating the coal commission are reincorporated and sectionized in the new bill and three new sections, Nos. 9, 10 and 11, have been added. The new sections empower the commission and its authorized representatives to submit written questionnaires to any person, who is required to answer in writing, under oath, within the time specified by the commission or its representative. Under the new sections refusal to answer and return the questionnaire or giving of false testimony, evidence, statements and entries is made an offense for which suitable punishment is provided. In case of refusal to obey subpoenas, to testify or to permit accesss to documentary evidence the commission is authorized to invoke the aid of the federal district courts to compel obedience.

The new sections are as follows:

Sec. 9—The commission or any officer, employee, or agent thereof duly authorized by the commission may prepare and submit to and require to be answered by any person written questions of fact concerning any of the matters which by this Act the commission is empowered or directed to investigate, and such person shall thereupon answer fully and in good faith any and all questions so propounded. Such answers shall be in writing and shall be verified by oath of the persons making them and shall be returned to the commission or its officer or agent within the time which the commission or any officer or agent thereof duly authorized by the commission may prescribe. The oath may be taken before any member of the commission or any officer or agent of the commission by it duly authorized, or before any officer authorized to administer oaths either by the laws of the United States or the laws of the state in which verification is made, but when taken before a notary or other state officer such oath shall be certified under the hand and official seal of such officer.

Sec. 10.—Any person who shall willfully neglect or refuse to attend and testify or depose, or to produce or permit access to any book, account, record, document, correspondence, paper, or other evidence, or to answer any written questions propounded by the commission or any officer or agent thereof, or to return such answers, as herein provided for, and any person who shall willfully give false testimony in respect of any matter or thing under investigation by the commission, or shall willfully make or cause to be made any false entry or statement of fact in any written answer or report called for by the commission or any officer or agent thereof as herein provided for, and any person who shall willfully make or cause to be made any false entry or statement of fact in any book, account, record, document, correspondence, paper, or other evidence, with intent to deceive the commission or any officer or agent thereof, shall be guilty of an offense and upon conviction thereof be punished by a fine of not more than $5,000, or by imprisonment for not more than one year, or by both such fine and imprisonment.

Sec. 11.—In case of disobedience to any subpoena issued by the commission or any member thereof, or of refusal or neglect to testify concerning any matter or thing under investigation by the commission, or of refusal to make written answer to any question propounded by the commission or any officer or agent thereof, or of refusal to permit access to any book, account, record, document, correspondence, paper, or other evidence, by any person, the commission may invoke the aid of the District Court of the United States for the district in which such person resides, in requiring obedience to its process, orders, and requests; and the several District Courts of the United States are hereby invested with jurisdiction in case of such contumacy or refusal to obey the process, orders, and requests of the commission to issue an order requiring compliance therewith. Any failure to obey such order of the court may be punished by the court as a contempt thereof. For the purposes of this section the Supreme Court of the District of Columbia shall be considered a District Court of the United States.

It is understood that Representative Winslow will call up the bill in the House at an early date and endeavor to have it passed as quickly as possible.

EUROPE'S ONE PRAYER appears to be "Forgive us our debts."—Philadelphia *Evening Public Ledger.*

WISH K.K.K. stood for Koal Kar Koming.—*Brooklyn Eagle.*

Union Calls Off Coal Strike at Connellsville

The strike in the Connellsville coke region is at an end. In convention assembled at the Union Hall at New Salem, Pa., Jan. 18, International organization, United Mine Workers, officially notified the delegates of the sixty locals scattered through Fayette County that, so far as benefits were concerned and further active participation, the International union was through.

The news was presented in speeches by International Representative William J. Feeney, John J. Heinz, an international board member; John O'Leary and President Van A. Bittner, of district 5.

The strike which has just come to an end was the greatest in the history of the coke region. Starting April 1, 1922, at first with an incursion of the western end of the field, the walkout spread in a fan-shaped movement to the south, taking in the Masontown or Klondike region almost to a man. From there day by day the infection spread to the north, finally reaching Uniontown proper.

It is estimated that 20,000 miners were idle during the peak of the strike, and of these, it is estimated, more than 16,000 joined the union.

Big Midwest Operator Tells Why He Favors One Year Continuance of Present Scale

An effort in the Middle West to stir operators up against signing a one-year continuance of the present scale of wages and get them to wire the operator delegates at the New York conference last week to refuse "to be stampeded by the Coal Commission" resulted in at least one counter effort on the part of the head of a big operating company which is subsidiary to a railroad. This operator felt that nothing better could be done under the circumstances than sign for one year, as the commission had suggested. He presented his reasons therefor succinctly. At least one of the Middle Western delegates to the conference replied, before going to New York, that he agreed entirely to the proposed one-year plan but that he would rather draw down a strike than sign for two years, as John L. Lewis, president of the union, seemed ready to demand.

The operator in his letter to delegates said that agitators against the one-year continuance of the present contract are wrong in their conclusion that the operators may be frightened into taking action simply because the government fact-finding commission has suggested a renewal of the present agreement for another year.

"As I see it," says the operator, "the operators are interested in satisfying the public demand provided it is not injurious to the coal-mine owners' interests, and I cannot see that any harm whatever could possibly come to the operators by their agreeing to continue the present contract for another year, and my reasons are embodied in the following:

"(1) It would be a good stroke of business policy to do it, because the government's commission has requested it.

"(2) Consumers generally (and they pay the bills) apparently prefer the present high cost rather than have a suspension of the coal mines of the country this year.

"(3) A definite and substantial policy which will satisfy the public and the government that contention with the mine workers is warranted cannot be sustained until the government commission makes its report.

"(4) Contention with the mine workers for lower wages to meet competition of the non-union fields would not, as I see it, be a valid reason, because the non-union operators could, and would, when they so desire, change their rates of wages as circumstances warranted.

"(5) It would, I feel, be folly to allow a strike to occur this year, for which the operators might in part, or wholly, be held responsible.

"(6) If the miners demand that the agreement be extended for two years instead of one, it would, I feel, be good policy to refer the matter to the commission for its decision, saying to the commission that it is not the desire of the operators to extend the present high mining rate and day-wage scale for a longer period than is absolutely necessary and that the demand of the operators for a twelve-month agreement is based upon their judgment that the commission will have made its report in sufficient time to be used in January, 1924, if not earlier.

"It must not be forgotten that public opinion can, and will, bring sufficient pressure to bear, through the press and government representatives, to force their will upon the industry, and we had better have their friendship than their ill will, and the mine owners can rely upon as fair treatment as they are entitled to; more than that they should not expect.

"It would be suicidal to run counter to public opinion and the government's views."

New Kansas Governor Would Kill Industrial Court; "Can't Be Done," says H. J. Allen

Both the Kansas Public Utilities Commission and the Court of Industrial Relations, which has played so important a part in coal mining labor troubles in that state, are doomed if the newly elected Governor Davis, Democrat, has his way. Mr. Davis bitterly attacked the court all through his campaign and in his first message to the Legislature, Jan. 10, he asked the abolition both of the court and of the commission. In their stead he urged legislation to permit the appointment by the Governor of two commissioners. Ex-Governor Henry J. Allen, Governor Davis' immediate predecessor and stanch advocate of the industrial court, said in Chicago the 12th that the Republican Legislature would see to it that the Governor did not touch the industrial court.

On the day of his inauguration Governor Davis received a petition from organized labor, addressed jointly to him and the Legislature, for the abolition of the Court of Industrial Relations and the restoration of the old office of Labor Commissioner, the commissioner to be named by the state Federation of Labor. The latter demand carried with it a request for the restoration of another practice, ended many years ago, of permitting union coal miners to name the State Mine Inspector. There is no question of the support the Governor will receive from Union labor in his move to kill the court, but Kansas is a farm state, where labor can help to swing an election, but where it cannot do the job by itself.

House Move Would Bar Judge Alschuler from Coal Commission; Senate Favors Him

By a substantial majority the committee on Interstate and Foreign Commerce of the House of Representatives has reported out the amendments to the coal commission act eliminating the provisions which would allow Judge Alschuler to serve as a member of the commission. It was pointed out by members of the committee that there is no intention to reflect on Judge Alschuler. The committee feels that it would set a bad precedent to levy on the bench for talent with which to conduct executive functions. Since the judiciary is made up, with few exceptions, of outstanding men the temptation would be great to draft these men into various services, once the way was made easy. Then, too, the committee feels that it is bad for the judiciary itself to have a judge committed to some policy or other when it is certain that he will be called upon to pass judicially on many such cases brought before his court.

The chances are, however, that the matter excluded by the House committee will be restored by the Senate. The Senate hardly could do otherwise now that it has confirmed the nomination of Judge Alschuler. There is no reason, argue some of the members of the upper house, why the public and the government should not have the advantage of the services of any member of the judiciary when he happens to be particularly fitted for an important task.

In this particular instance insistence by the House on the attitude of its committee would rob the President's Coal Commission of one of its strong members. It would remove from the commission a man who has lived with its work for three months. It would be difficult for a substitute to bring himself abreast with the other members. Moreover, Judge Alschuler knows the seamy side of unionism as well as its good features.

Agreement Reached to Renew Wage Contract for One Year

Agreement to renew the existing wage contract for one year from April 1, 1923, was reached by the subcommittee of operators and miners from Illinois, Indiana and eastern Ohio in session at the Waldorf-Astoria, New York, late Tuesday afternoon, Jan. 23. The subcommittee was scheduled to make such a report to the full conference at 10 a.m. on Wednesday and there was not the least doubt that by noon on Jan. 24 a contract would be signed. Thus all possibility of a strike in 1923 is eliminated.

When the session opened on Tuesday, Illinois and Ohio wanted to renew for one year. Indiana moved to amend the motion, substituting two years for one. The amendment was defeated, having only Indiana's support. Indiana then moved to amend by striking out the penalty clause, explaining that they considered the penalty clause a bar to damage suits where loss had been sustained by violation of contract. Illinois and Ohio voted no, and this amendment was lost.

A subcommittee of two, John L. Lewis and Phil Penna, was then appointed to retire and iron out the differences. They retired to another room, where for an hour or more they went over the situation. There is no account of what transpired there but it is understood that Lewis gave assurance of contract enforcement in Indiana, for the result of the meeting was a report to the full subcommittee to accept the one-year contract without change in conditions or wages.

Other districts will now begin the formalities of negotiation, but it is generally understood that all union fields will soon accept the lead of the three-state conference.

With a cut and dried program the United Mine Workers and operators from Illinois, Indiana and eastern Ohio—the old Central Competitive Field minus Pittsburgh—met in New York on Thursday, Jan. 18, at the call of John L. Lewis and Phil Penna, to negotiate a wage contract for the period beginning April 1, 1923. Preliminaries only were dealt with the first day, the conference comprising full delegations from all fields meeting at the Hotel Pennsylvania and going through the formalities of electing officers and selecting a credentials committee.

Western Pennsylvania Group Knock at Door

This credentials committee had a job on its hands at once, for there were a group of operators from western Pennsylvania knocking at the door. These operators, representing so-called independents, are outside the regular organization in the Pittsburgh district and were among those who early signed the Cleveland agreement last August. They were not seated at this conference on the ground that they do not represent the district from which they come. This left Illinois, Indiana and eastern Ohio to participate. Southern Ohio put in no appearance, but has done nothing, it is pointed out, to hinder the proceedings and it is understood will accept the findings of this conference.

When the meeting convened Friday the miners presented their demands in full, as of the February, 1922, convention at Indianapolis. This list included the 6-hour day, the 5-day week, abolition of the penalty clause, as well as no reduction in wages. The operators promptly voted down the demands, and after some further skirmishing the whole matter was referred to a subcommittee of two on each side from each district and the officers of the union and of the meeting. This is as has been customary for some 25 years. The subcommittee and officers are as follows:

Operators—S. H. Robbins and W. S. Haskins, of Ohio; Rice Miller and H. C. Perry, Illinois, and M. L. Gould and P. H. Penna, Indiana.

Miners—Frank Farrington and Harry Fishwick, Illinois; John Hessler and Will Mitch, Indiana; Lee Hall and G. W. Savage, Ohio.

Officers of the Conference—Michael Gallagher, chairman; William Green, secretary, and Walter L. Robinson, assistant secretary.

Officers of the United Mine Workers—John L. Lewis, president; Philip Murray, vice-president.

Saturday the subcommittee began work. No results were announced and the meeting was resumed on Monday at 10 a.m., this time at the Waldorf. Adjournment came at 2 p.m. and another session began on Tuesday morning, with no conclusion reached. The only statements made were perfunctory announcements of progress and emphatic assertions that there would be no strike; that in fact there is not the least possibility of a strike.

It having been predetermined by circumstances on receipt of Mr. Hammond's second telegram to the joint conference at Chicago early this month that there would be no demand from either side for changes in wage rates, all that remained, so it appeared on Saturday, was to decide whether the contract would be for one year, as Mr. Hammond had formally requested, or for two years, as demanded by the union and reported to have been "casually" suggested by Mr. Hammond some two weeks ago.

Question of One or Two Years at Issue

This question of one year or two years occupied a prominent place in the discussions on Friday and Saturday. The union contended for two years and Indiana and Ohio fell in line. The arguments that are understood to have caused these operators to be willing to take on the longer period were that wages in other industries were going up now and that a year from now it might be necessary to give an increase and, more important, that the operators would be at a decided disadvantage were they to try for a new contract in 1924 with a presidential campaign and election going on. It was argued among the operators that the political pressure on them in 1924 to settle without trouble might be so great as to give the union a chance to further advance its cause without opportunity to go into the merits of the questions involved.

Illinois, however, held out for a one-year agreement, feeling that their district, above all others in the meeting, will suffer the most from non-union competition with the present high wage scale renewed. The delegation of operators from that field, as well as from Indiana, has been deluged with propaganda and letters and telegrams from "back home" urging the conferees to demand a wage reduction. The delegation in New York, however, found out the impossibility of any such demand and is going ahead to get the best deal possible in view of the admitted strength of the union and the public declaration of Mr. Hammond for a renewal of present wages. When Illinois held out for a one-year contract, the others agreed, because under the rules of their joint conference the vote must be unanimous on every point and there was no disposition to halt the conference on that score.

On Monday, however, a new element was introduced. One group of operators, understood to have been Indiana, asked John L. Lewis to go on record, if not in the contract, in favor of some method more effective than that now agreed upon for contract enforcement.

Indiana has suffered greatly in recent years from petty strikes. From this cause there has been no redress, the district president having refused to bring them to settlement—afraid, it is commonly believed, that he would lose his job if he interfered. Ohio and Illinois, under Lee Hall and Frank Farrington, have had no such troubles. The policy of John E. Lewis has been that he would exercise his own judgment and will in the matter as to whether he would consider an appeal from the state officers in such matters. It is alleged that in general he has refused to assume jurisdiction. What the Indiana operators sought was some declaration from Mr. Lewis that when a mine was struck and after all proper efforts had been exhausted to find a settlement, he would, on appeal from the operator, arbitrate the case.

Rumors that the operators had sent a delegation to Washington to find out what assurance would be given by the government that no prosecution under the Sherman Law will follow an interstate agreement were strenuously denied.

First Five Herrin Prisoners "Not Guilty"; Remaining Massacre Cases Will Proceed

The first five men charged with murder in connection with the Herrin massacre have been declared not guilty. A jury of one miner and eleven farmers, two of whom are former miners, returned this verdict in the Williamson County Court at Marion, Ill., Jan. 19, after twenty-six hours' deliberation. The five prisoners, four of them union coal miners and the fifth a laborer of Herrin, Ill., had been on trial since Dec. 13, 1922, for the murder of Howard Hoffman, one of the twenty-one non-union men shot and cut to death June 22, 1922, after 48 men besieged in the Lester strip mine near Herrin had surrendered to a mob.

The state's attorneys prosecuting the case had little to say after the verdict was returned except that acquittal in the face of such evidence was due to intimidation of jurors. Considering the sentiment of Williamson County, there is no surprise at the outcome of the case. The region is a United Mine Workers stronghold, and the local authorities not only did not interfere with the massacre but failed to arrest a single man for it. Every obstacle was put in the way of state and government agents who worked up the case during the summer before a grand jury finally was impanelled and returned 416 indictments for murder, conspiracy to murder and conspiracy to riot against 77 men.

"Of course we will proceed to try the rest of the cases," was Attorney General Brundage's only comment. No date has been set, however. The same five men adjudged not guilty of murdering Hoffman are indicted for murder in the case of the deaths of several more of the 21 dead men. Thus none of the five is a free man. They are Otis Clark, union official; Leva Mann, Joe Carneghi, Pete Hiller and Bert Grace. Each will figure in the series of trials that may now ensue before the state gets through prosecuting. It is impossible to get a change of venue so as to move the trials from Williamson County, where the massacre took place, so the remaining trials will be held in Marion.

The battalion of attorneys employed by the United Mine Workers to defend the five prisoners—attorneys paid from the union defence fund, contributed to by at least one member of the jury and by most of the defence witnesses who impeached the damning testimony of the state's witnesses—issued a statement after the verdict was in, pushing to the fore the union propaganda that the prosecution of the whole Herrin case is nothing less than persecution of labor by capital. The statement read thus:

"A jury composed almost totally of Williamson County farmers returned a verdict of not guilty as to all the defendants. The defendants' attorneys, of course, feel happy at the result; happy because this may and ought to be the birth of a new era in industrial disputes in America. The defense was directed against the vicious and unwarranted, brutal and murderous use of a private army of gunmen. If this trial has taught the lesson well that hereafter the weapons of the employers' private army shall not be directed against human beings, then the trial, with all its sacrifices, has not been in vain.

"If only the American public could be advised of the true facts as they fell from the lips and manner of the witnesses upon the stand, no real American would disagree with the verdict rendered by this jury of farmers. It was the only righteous verdict which could have been rendered against an army of invaders."

During the last days of testimony before the case was suddenly put into the hands of the jury, the defence continued its long string of character witnesses, all attempting to impeach the incriminating testimony of the prosecution. They testified that Donald M. Ewing, a newspaper reporter, could not possibly have been at the cemetery in time to offer one of the dying men a drink of water only to be met with the point of Bert Grace's gun. The bodies were removed, they all testified, before the time estimated by Ewing as about the hour when that brutal event took place.

They testified that Dr. O. P. Shipman couldn't possibly have been at the cemetery to see, as he declared he did see, Joe Carneghi, Leva Mann and two other indicted men shoot into the bodies of the six men roped together by their necks. They said he was at or near his office at the time he said the shooting took place. They said he privately confessed he wasn't sure of the identity of a single man in the mob of June 22.

Two or three of those who tried to impeach the doctor's testimony admitted they were miners employed by the union to gather defence evidence. Practically every one of the defence witnesses are miner's union members and admitted they were contributing to the defence fund.

One of the defence witnesses, G. J. Frick, a Marion undertaker and former miner, said he reached the cemetery with his ambulance at 9:25 the morning of the slaughter and waited for the men to die before he took the bodies.

"You mean to say you let the ambulance stand there while men were lying on the ground dying?" quizzed a prosecution attorney.

"I went to a telephone to call Coroner McCown," said Frick.

"And you saw those men there with their throats cut and shot and bleeding and you heard them begging for water, and did nothing for them?"

"They weren't begging for water when I first came there but they were when I came back."

"Did you get any water?"

"No."

The defence appeared to do everything it could to avoid the introduction of evidence such as this about the brutality of June 22, even to the maneuver of waiving argument after State's Attorney Delos Duty had summarized the case. This prevented Attorney General Brundage and others from making any statements to the jury at the wind-up, when the case was turned over to that body.

Bids Opened for 76,100 Tons of Bituminous Coal for Navy Yards and Naval Stations

Bids for supplying 76,100 tons of bituminous or semi-bituminous coal for navy yards and naval stations were opened Jan. 19 by the Bureau of Supplies and Accounts of the Navy Department. The requirements were divided into two classes, one covering 25,900 tons for delivery during February and March, the other covering 50,200 tons for delivery between February and June, inclusive. The bids follow:

400 tons, for delivery to Naval Ammunition Depot, Lake Denmark, N. J., during February and March: Dexter & Carpenter, Inc., New York, $5.04 per ton, f.o.b. mines; Emmons Coal Mining Co., New York, $8.97 per ton; George D. Harris & Co., New York, $8.13 per ton.

1,000 tons, for delivery at Lake Denmark, February to June: Empire Coal Mining Co., Philadelphia, $8.08 per ton; George D. Harris & Co., $7.99 per ton.

10,000 tons, for delivery to Navy Yard, Washington, D. C., during February and March: C. G. Blake & Co., Cincinnati, $8.57 per ton; L. A. Snead Co., Washington, D. C., $8.04 per ton.

17,000 tons, for delivery at Washington, February to June: Chesapeake & Ohio Coal & Coke Co., $5.93 per ton, f.o.b. mines; L. A. Snead Co., $7.74 per ton.

400 tons, for delivery at Bellevue Magazine, D. C., January to June: Emmons Coal Mining Co., $7.32 per ton; L. A. Snead Co., $8.04 per ton.

2,000 tons, for delivery at White Plains, Md., February and March: Dexter & Carpenter, Inc., $8.45 per ton; Emmons Coal Mining Co., $8.09 per ton; L. A. Snead Co., $8.59 per ton.

5,000 tons, for delivery at White Plains, Md., February to June: Emmons Coal Mining Co., $7.86 per ton; Imperial Coal Corporation, New York, $7.61 per ton; L. A. Snead Co., $8.31 per ton.

7,000 tons, for delivery at Naval Academy, Annapolis, Md., February and March: Dexter & Carpenter, Inc., $8.38 per ton, in barges, or $7.88 per ton, rail delivery.

6,500 tons, for delivery at Portsmouth Navy Yard, Norfolk, Va., February and March: C. G. Blake Co., $8.68 per ton; Dexter & Carpenter, Inc., $8.55 per ton; Emmons Coal Mining Co., $9.16 per ton.

12,000 tons, for delivery at Norfolk, February to June: Chesapeake & Ohio Coal & Coke Co., $5.93 per ton.

Midwest Sees Combination Railroad Labor Board and I. C. C. Coming for Coal Industry

The final paragraph of the United States Coal Commission's preliminary report of Jan. 15 clinched it for Midwest coal operators. The commission is going to recommend regulation of coal by commission. The Midwest has expected this. Now it is convinced. The commission is to be a sort of composite of the Railroad Labor Board and the Interstate Commerce Commission with power to restrict the opening of new mines, to restrain miners from striking too impetuously and to exercise a measure of price control. The commission studiously avoids saying so openly, but read the last paragraph of the report, say observers in the Middle West.

That final paragraph reads thus: "The commission believes that the public interest in coal raises fundamental questions of the relation of this industry to the nation and of the degree to which private right must yield to public welfare. It may be that both private property in an inexhaustible resource and labor in a public service industry must submit to certain modifications of their private rights receiving in return certain guarantees and privileges not accorded to purely private business or persons in private employ."

Coal Is a Public Utility, Says Chicago

In other words, according to much individual opinion in Chicago, which is a center of coal operations for Illinois and Indiana, coal is a public utility and should be under government control henceforth. Though coal deposits are nearly inexhaustible, anybody and everybody should not be allowed to produce coal for sale unless they can show that public necessity and convenience demand it. Since coal is a public utility the right of strike and lockout must be curbed materially and prices of coal must not be left to the well-known but often troublesome law of supply and demand any more than the price of gas. But neither should the public be left free to upset the whole coal industry by holding out until coal prices are bumping the bottom and then by pushing into the market madly with disastrous results all around. Purchasing should be steadied and made more uniform in order that production and working time also can be steadied and made uniform.

"Sounds good to me," said one veteran operator. "It has long been apparent that something of this sort is essential in this industry. I'll admit I'm tired to death of this constant labor struggle and this constant struggle over the coal market. Coal is one of the most tiresome and unsatisfactory necessities of life to produce and handle. I'm getting along in years and don't want to fight all the time. I'd rather do business on a business basis. I want a reasonable number of miners working for me at a reasonable wage a reasonable number of days a year. I want the public to have my coal at a reasonable price and I want it to take that coal through a reasonable number of weeks of the year instead of all in the winter. It would be a lot more pleasant for me to take a reasonable profit—yes, a pretty small profit—steadily right along, than to work on this feast-and-famine scheme. If the commission recommends what it appears to be preparing to recommend, I hope Congress and the country carry out those recommendations."

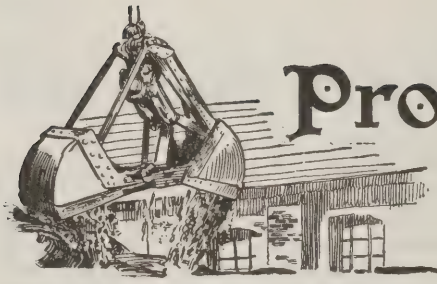
Three other active operators expressed much the same opinion, and they were not veterans worn by the long labor and market struggle either. They were one in banking firmly upon the business judgment and fairness of the commission to produce a solution for some of the principal ills of the industry—a solution that, once put into effect, will stick.

"But," remarked one man wise in the ways of the United Mine Workers, "how do you think a coal board will get along with the union? Can you imagine a tougher nut for any government board to crack? Where is there any labor group dealing with the government that is so unified? Or so bullheaded? Or in the hands of so few men? And, though you might say it's better to deal with the group through a few men than through many, yet you mustn't overlook the fact that the size of the miners' union is expected to be shrunk down and the free and easy power of strike to be curbed. That hits those few men right where they live. The importance of their jobs depends upon their ability to fight the miners' battle unhampered by the government or anybody else. Won't it be a 'backward step' for the union to permit the coal industry to get into the hands of a coal commission which has the power to enforce its rules? The union is not going to take any 'backward step' you know."

"Right there will be the whole trouble with this scheme," contributed another operator who heard the comment. Union labor certainly will rally at Washington when this commission legislation comes up for passage, to see to it that labor has a little more than 50 per cent representation on this commission. The difficulty, as I see it, will be to prevent any government coal board from falling into labor hands."

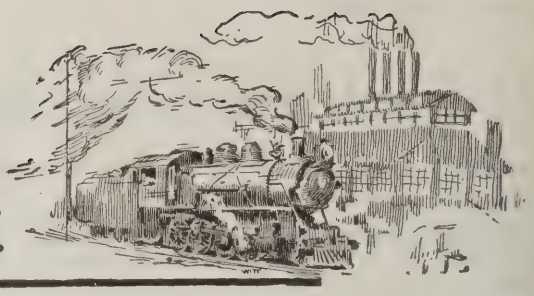
Many Midwesterners are convinced now that government board control—which some of them call "the McAuliffe plan," because Eugene McAuliffe, former president of the Union Colliery Co., worked out something of the sort for the Coal Commission—is the logical thing to result from the commission's work. Most of them watch for it hopefully.

Some there are who hoot at it. These are mainly operators of a size and experience which lead them to feel that they can care for themselves in all weathers and that the law of supply and demand is sufficient to control at all times. These are strong for a continuance of present conditions, which they think would eventuate in most of the mines of the country falling into the hands of a small number of large and competent ownerships. Once in these hands—a season or two like the one in prospect for 1923 might produce this alignment—war to the death with union labor could go on to its logical end, which is union defeat. For those operators, there is no better way.



Howat Out of Prison on Parole; Officers Try to Restore Harmony in Kansas

Alexander Howat, deposed president of the Kansas union coal miners, and five other deposed officials who had been, like Howat, serving a sentence of one year for contempt of court in calling a strike, were paroled Jan. 20 by Judge D. H. Woolley at Pittsburg.



Judge Wooley, who paroled the prisoners from the Crawford County Jail at Girard, said that the applications for release referred only to the sentences for one year, and did not mention the indefinite sentence imposed against the men, requiring their imprisonment until they consented to testify before the Kansas Court of Industrial Relations.

As a first move in harmonizing and solidifying the coal miners of the southeastern Kansas field, the recently elected officers of District 14 have announced suspension of the fine of $15 assessed against miners of the district who failed to quit work when ordered to do so by a district convention June 16, 1922. The dispensation extends to March 1 for all who desire to return to the fold. By the election, a ticket recognized as representing the Howat faction was put into office.

During the strike, unauthorized by international officials, last year, in which Alexander Howat, then president of the district, and John L. Lewis, international president, clashed, the district lost its charter. Autonomy was restored with the assumption of office by new officers the first of this year. The present move is to recruit to the newly recognized organization some 2,000 miners who continued to work last summer and who have refused to pay the fine of $15 in addition to the initiation fee of $10 that is exacted if they would rejoin the union.

Production and the Market

Weekly Review

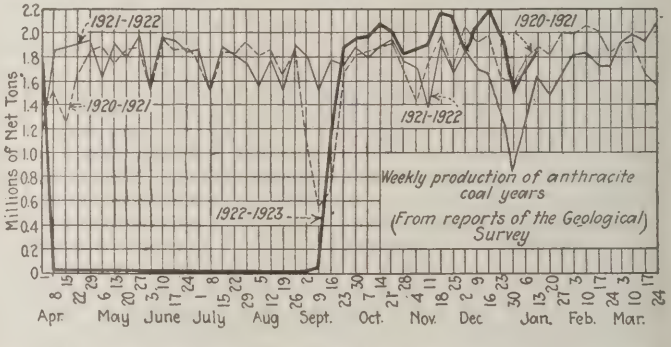
Reports are general of easiness in all markets. Anthracite is moving quicker to Eastern points but there is dullness in the movement of bituminous coal. Production of soft coal, notwithstanding railroad difficulties, slow buying and illness among the miners in some of the Southern non-union fields, hangs around 11,000,000 tons. *Coal Age* Index of spot bituminous prices decreased 7 points last week and stood at 358 on Jan. 22, with a corresponding average price at the mines of $4.33 as compared with $4.42 the preceding Monday, reflecting the general letdown accompanying the warmer weather and the spread of feeling that there will be no strike on April 1.

With the strike scare removed and the country generally with fair stocks of soft coal, there is nothing in sight save temporary and local car shortages to hold the market up. In another thirty days the stringency caused by the anthracite shortage will have been passed.

Ruhr Shutdown May Boost Demand in America

Many in the coal trade are watching the struggle in the Ruhr in the expectation that a general shutdown of this large coal field, where about 2,000,000 tons a week is produced, will result in a demand for outside coal greater than England can supply. The only other source, of course, is the United States.

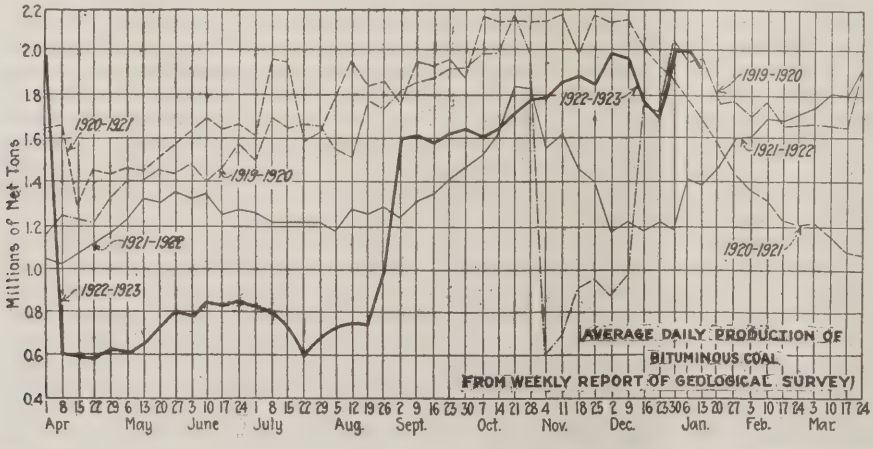
High-grade coals are generally under contract and little but lower grades are available on the spot market.



The anthracite situation is much quieter. Production continues to be interfered with by petty strikes over which the union leaders contend they have no control. The steam sizes of anthracite are being quickly absorbed. Buckwheat is easier and quotations indicate that the independent products are not moving as easily as a week back.

"Revised estimates for the week Jan. 8-13 indicate a total output of soft coal, including coal coked, mine fuel and local sales, amounting to 11,172,000 net tons," says the Geological Survey. "The final estimate for the first week of the year is 10,993,000 tons.

"Preliminary reports for the third week in January show 44,736 cars loaded on Monday and a decline of 32,891 cars on Tuesday, and 30,582 on Thursday. The total output for the week Jan. 15-20 is expected to be about 10,900,000 to 11,000,000 tons."



Midwest Situation Easier

A general let-down in coal trade made itself felt throughout the West and Middle West during the past week. Continued warm weather and the increasing spread of certainty that there will be no strike are held responsible. Steam coals and the middle sizes of fuels were all having a hard time to avoid distress on cars and the sinking sensations spread

even to domestic sizes, though the demand for them was fair and the stronger companies of southern Illinois and Indiana managed to maintain their price levels in most cases. There was general prophecy that prices will slump all around by the end of this week.

In Chicago, shippers were compelled to work hard toward the end of the last week to move everything they had in transit. Week car supply in some fields performed the usual feat of saving the situation from absolute collapse of the market. Franklin County screenings had receded to an average of $2.75, which was a small recession, but Central Illinois, always early to show the effects of pressure, slipped 25 or 50c., lowering lump to $4.25, mine run to $3 and

screenings to $1.75. Indiana coals showed about the same downward movement. Very little Eastern fuel reached that market. Every man in the coal trade was hoping fervently that Saturday night's thin clouds from the north and west would roll up a storm and bring icy blasts of wind.

In St. Louis conditions were about the same. Trading was mostly in the cheaper coals and nobody showed any desire to buy heavily for storage. Poor car supply was all that kept the Carterville mining field out of a bad slump. Railroad tonnage out of that field remains good, however. The same conditions prevailed in Jackson County and the Duquoin region. The Mt. Olive region, normally a heavy St. Louis shipper, saw its volume to that city slump, but it was able to move a good deal to Chicago. Its car supply was better than the demand required. Standard field mines without railroad contracts averaged between 1½ and 2 days during the past week. All sizes there are in surplus and hard to move.

The price softening noticeable in most Western regions is only beginning to be felt in western Kentucky, where the lower grade fuels have dropped some but where domestic and industrial demand is still strong enough to keep the market right side up. There is no big general movement in any direction, however. Coal movement through Louisville has been poor of late because of the congestion on the Kentucky & Indiana Terminal R.R., which has recently suffered the loss of a number of yard engines condemned for poor condition.

The Northwest has not worried much over the coal situation during the past week. Though dock stocks contain a remarkably small proportion of free coal considering the time of year—there is only 450,000 tons free on the docks at the Head-of-the-lakes to last that region until the re-

opening of navigation—yet prices are not stiffening much because rail coal is coming in steadily and at shading prices and because the weather for several days has been mild.

The shortage of hard coal agitates fewer people every day. Although dock supplies are practically gone and rail anthracite is confined mostly to egg and buckwheat, which are unpopular sizes, yet there is no mob storming the dock gates for the available fuel. Soft weather has had something to do with that, The general turn from hard to soft coal and to coke and briquets for domestic use has further aided to produce this effect. It is now estimated that Duluth and Superior have received about 80 per cent of their normal supply of hard coal. If other communities in the upper country are as well supplied, then the shortage of anthracite is not so painful as it might be. In Wisconsin the State Fuel Commission has not carried out its threat to seize the available anthracite in order to more carefully apportion it.

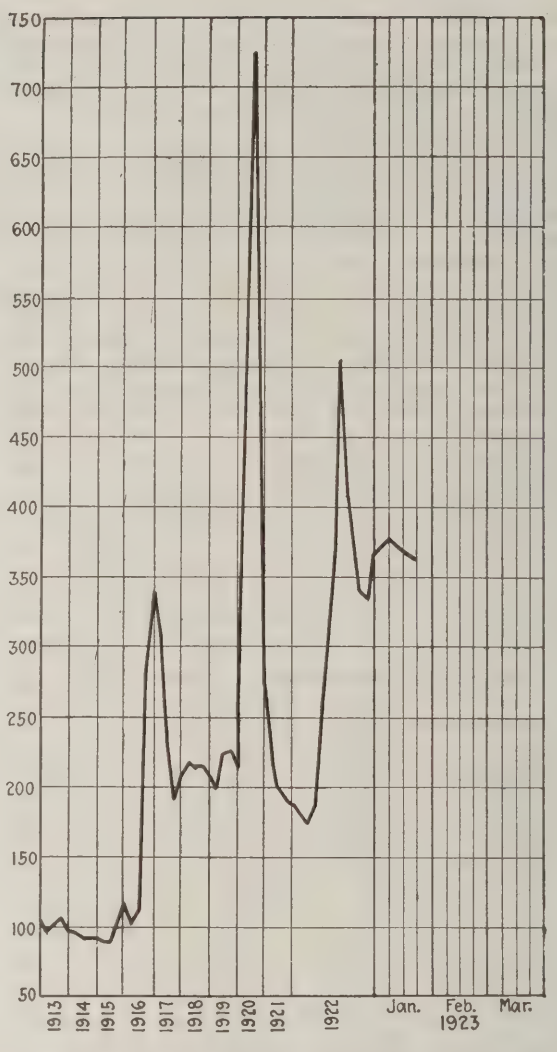
The West and Southwest also float along easily. The mild weather of the past week has been general. In Utah, with the thermometer running up to 58, domestic demand has softened a good deal and mines have been working recently only about 40 per cent. There is a good industrial call however. Several operations are preparing to turn their whole output into slack as a result.

Because of poor domestic demand Colorado lignite prices varied widely but bituminous in that state held fairly steady with production at about half-speed. Colorado Fuel & Iron Co. mines get good running time in the Walsenburg and Trinidad districts because of the company's big steel contracts which have the Pueblo mills operating steadily now. Domestic demand for coke in Denver has picked up. C.F.&I. domestic lump coal sells at retail for $14 and nut size for $12. Denver Gas & Electric coke is priced at $10.

Around Kansas City the coal market would be shot completely to pieces were it not for the short car supply. Short cold snaps are all that have kept many mines from shutting down cold. Kansas lump sells there for $5.50, mine-run for $3.50@$3.75 and screenings for $2.50. Arkansas semi-anthracite goes at $6 for lump, $3.50@$4 for mine-run and $1.50@$2 for slack.

Conditions in Ohio

The situation in Ohio has been affected by the optimistic reports emanating from the camps of both operators and miners that there is not much danger of a strike April 1. Mild weather conditions put a damper on buying of both domestic and steam coals, which is confined largely to immediate requirements. Reserves in Ohio in steam grades are estimated at from 45 to 60 days. Retail dealers are not heavily stocked. Pocahontas and smokeless grades are hard to get and West Virginia splints, Kentucky and Ohio coals make up the bulk of the tonnage.



In Cincinnati the fact that the storage piles have not started to build up indicates that all of the river coal is going to consumers. There has been a large number of rejections due to the reductions in values during the past ten days, both by-product and steam coals showing a reduction of 50c. a ton.

New River mines are securing a somewhat better car supply from the Chesapeake & Ohio but the improvement has not been sufficient to add materially to the total production of the district. Few mines are working more than two full days a week. Most of the coal produced is going to Tidewater and Eastern inland points due to the inability to secure equipment for western loading. Gulf production is on a limited scale owing to the inability of the Virginia Ry. to make any headway in materially increasing transportation facilities.

Losses in the Pocahontas region are usually heavy as a result of poor transportation facilities. Mines are shipping about 200,000 tons a week out of a possible production of 600,000 tons.

Mines in the Tug River territory are not getting out more than about 40 per cent of their normal tonnage, much of which is going to Western market.

Operations in the Kanawha region is being interrupted by influenza among the miners, some mines being forced

Coal Age Index 358, Week of Jan. 22, 1923. Average spot price for same period, $4.43. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

to suspend operations for several days at a time. Approximately half of the present production is moving on contract. Steam coal for Western delivery in mine run grade commanded a price of $3.25 to $3.75, with by-product mine ranging about 25c. higher. Splint lump in Western market ranged in price $5.50@$6.

With improved transportation conditions on the Chesapeake & Ohio in northeast Kentucky it has been possible to load more coal but the output of the district is not over 34 per cent, or about 125,000 tons, a week. There is a steady demand for steam coals by industrial concerns who find it necessary to restock. Mine-run brings $3.50@$4, with lump and block at $6@$7.

Influenza interrupts production in the southwest Virginia region, but even with inadequate car supply the output is not averaging above 55 per cent. There is a strong market for all grades, with mine-run bringing about $5.50 a ton.

The bulk of the tonnage from the Northern Panhandle mines is going to Eastern markets. Mine-run grades were quoted $3.50@$4 and prepared coals $5.50@$6.

In some parts of northern West Virginia the price of steam mine-run ranged $3@$3.35, in other sections $3.50@$3.75.

Atlantic Seaboard

There is generally less anxiety on the part of buyers in New England than a fortnight ago. Embargoes against New Haven territory have thrown an extra volume of spot coal all-rail for distribution over other lines, and prices have not hardened to the degree anticipated. Lower temperatures will also tend to increase water power for many of the textiles as well as several of the larger utilities, and this will remove a class of buyers that was prominent early in the month. Increased receipts from Hampton Roads with an occasional cargo from Welsh ports have been another factor in retaining prices about on last week's level. Steam users show less interest in spot coal and are much more inclined to await developments.

Favorable weather along the coast will mean a steady increase in receipts, especially from Hampton Roads, and there is already developing enough additional tonnage from Philadelphia and New York by the water route to make itself soon felt in reduced demands all-rail.

Navy standard coals are distinctly in better supply at the Virginia terminals. While car supply continues notably short on the Southern roads, service is more dependable and there is a somewhat diminished call for prepared coal West. The high range of spot prices, netting well over $6 per net ton at the mines, is another reason for increased volume to Tidewater. Rehandling factors at Boston, Providence and Portland have realized $11 and upward for Pocahontas and New River per gross ton on cars for inland delivery.

As an indication of car shortages on the roads serving Philadelphia it is interesting to notice that once more large users at Philadelphia are arranging for temporary supply by water from Hampton Roads. This movement shows no prospect of involving large tonnages but it has a certain significance. Higher prices at Hampton Roads have also had the effect of inducing more spot buying of selected Pennsylvania grades.

The situation in the North Atlantic market is easier and New York demand is slow. The number of cars at the local terminals remain close to 4,000. Much of the easiness is attributed to the increased shipments of anthracite to the New York market and the falling off in demand for substitutes. There were some cancellations reported principally of the screened coals.

Consumers closely watched the proceedings of the wage conference, although there was a feeling that there would be a settlement.

There was a stiffening of prices at Baltimore following colder weather and another breakdown in car supply.

Anthracite

Estimates of production of anthracite during the week ended Jan. 13 indicated an output of 2,113,000 net tons, an increase of 2.2 per cent in comparison with last week. Of this tonnage, New England received 3 217 cars.

Final returns on anthracite production in December, 1922, indicate a total output of 8,430,000 net tons, says the Geological Survey. This is the largest December production recorded. It was, however, only 45,000 tons more than in November and was 148,000 tons less than in October.

The production of anthracite in 1922 is estimated at 52,485,000 net tons, which is 45 per cent less than the 1921 production and 43 per cent less than the average annual production during the nine years 1913-1921.

Since the strike settlement production has averaged approximately 2,000,000 net tons per week and been at the rate of over 100,000,000 tons per year. Thus the output during the last quarter of 1922 amounted to 48 per cent of the total for the year.

Coke

The settlement of the strike in Connellsville region had no apparent effect on production. About 2,000 men were affected by the action in calling off the strike.

The coal and coke markets remain firm, but there is no unusual demand for either fuel. The acute car situation is giving more support to the market than is the demand. Steam coal is selling at $3 to $3.25 with byproducts at $3.50 and $3.75. There is a steady demand for furnace coke both from the East and furnaces, which is supporting quotations of $8.25 and $8.50, with foundry coke selling at $9.

National Coal Directors Withhold Comment On Coal Commission Report

Following the quarterly meeting of the board of directors of the National Coal Association at the Waldorf-Astoria, New York City, Jan. 16, the board issued the following statement:

"In reply to requests of newspaper representatives for comment upon the preliminary report of the United States Coal Commission to Congress the board of directors of the National Coal Association states that any deductions made from the report as to the bituminous industry are manifestly premature and unfair to the commission, since the commission itself says that it has not had opportunity, as yet, to conduct such an investigation as would develop the necessary facts. The report is but a preliminary one and, as the commission says, is not intended to be conclusive.

"The commission is conducting an investigation, among other things, into matters relating to what is described as overdevelopment of the bituminous industry and says it will deal with that subject in a further report. The bituminous operators will submit data on this point to the commission.

"It may be stated, in passing, that the attitude of the industry, as expressed in its recent reply to the commission's letter directed to the industry, is that the law of supply and demand, if allowed to work, will adequately adjust any possible problem of overdevelopment. If the public will regularly place its orders for its coal supply, the miners remain at work, and adequate transportation facilities are provided to haul the mine output, no difficulty ever will be experienced in meeting the public necessity for bituminous coal. And when this situation obtains the public will never have any problem as to prices.

"High-price mines operate only when a coal shortage exists. They are unable to compete in the ordinary market. They open up only in emergency. Do away with the emergency through the consistent and regular ordering of coal, spreading it throughout the year, and the coal problem is solved, and to the advantage of the consumer."

Foreign Market And Export News

British Coal Output Resumes Upward Trend; Export Demand Is Active

British coal production in the first week of the year totalled 4,384,000 tons as compared with 3,428,000 tons for the previous week, an increase of 956,000 tons, according to a special cable to *Coal Age*.

Demand for export is active and the output is well sold up for January.

Operators are reported as being rushed with orders from the United States and Canada. France and Italy also are reported as heavy buyers. Much of this activity is attributed to the Ruhr Valley difficulties. Shippers, it is expected, will give preference to old customers.

South America, too, affords heavy business. Forty to fifty steamers are daily awaiting loading turns. East Coast demand is strong with heavy inquiries noted, including German. Prompt business is impracticable owing to the dearth of supplies. Every description is well sold for January.

Operators are in receipt of heavy orders from French railroads and large orders also have been received from German industries, which it is expected will be increased now that mining in the Ruhr Valley has stopped. The outlook for Welsh coal for the year is considered favorable.

Hampton Roads Situation

Business was duller at Hampton Roads, due to slump in demand for coal in the North. Coastwise business fell off to a very noticeable extent, though bunkers were holding well and export business showed little sign of picking up.

Prices had fallen off somewhat, due to the lack of demand and to a coincident increase in the flow of coal to port. This latter feature was particularly noticeable over the Chesapeake & Ohio, which was leading in supplies on hand. The market was firm, however, and a cheerful tone was over all.

The slump in business was regarded as only temporary and shippers were making unusually strong efforts to build up new business based on the feeling that the car supply is showing signs of immediate improvement.

French Domestic Demand Recedes

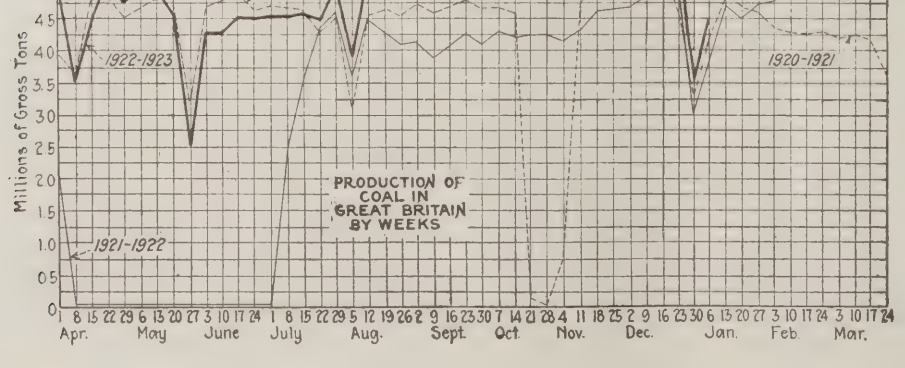
Owing to the mildness of the weather, the demand for French domestic coals has become much less urgent. All classes of industrial coals of the Nord and Pas-de-Calais are in good demand.

Coke produced at ovens attached to collieries of the Nord and Pas-de-Calais is selling at the following prices, according to destination (sales through the Société des Cokes de Hauts-Fourneaux excepted):

Blast-furnace coke	115—123 fr.
Foundry coke	125—133 fr.

It now seems certain, after the Douai conference, that the miners of the Nord and Pas-de-Calais will defer to the desire of the owners and wait until next April for having their claim of an increase of wages examined again.

France produced in November 2,799,549 metric tons of coal, as against 2,824,488 metric tons in October. devastated mines of the Nord and Pas-de-Calais are included in this total for 728,020 tons. In January, 1922, the output of these collieries was only 580,726 tons.



Export Clearances, Week Ended Jan. 18, 1923.

German Coal Production Improves

The German coal production in November shows, in spite of the comparatively low number of working days, an improvement compared with the previous month and with the corresponding month of 1921. According to the definite figures this production in 24¼ working days was:

Bituminous coal, 10,456,031; tons brown coal, 11,895,989; coke, 2,529,545; patent fuel: bituminous coal, 490,846; brown coal, 2,391,764.

Of the production of bituminous coal 8,272,479 tons or 80 per cent fall to the share of the Ruhr district, 767,793 tons to that of Upper Silesia, while the rest was supplied by the minor districts. As against November 1921 the production of bituminous coal is short by 1,250,000 tons, while that of brown coal has increased by approximately the same amount. This decline is due to the detachment of Polish Upper Silesia, which produced in that month 2,165,719 tons. The production of coke shows an increase of 180,000 tons against the corresponding month of 1921 and has for the first time surpassed pre-war figures, deducting therefrom the production of the alienated territories. The increase in the production of brown coal briquets amounted in November to 150,000 tons compared with November 1921. An extension of the existing briquetting plants is sorely needed in order to make the growing output of lignite more effective, but the large outlay required makes this almost prohibitive.

According to reports the standard of the November production was maintained the first two weeks in December.

News Items From Field and Trade

ALABAMA

Four miners were killed in an explosion in Dolomite Mine No. 1 of the Woodward Coal & Iron Co. near Birmingham, Jan. 10. The bodies of Frank Lewis, foreman, and three negroes have been recovered. The body of another negro was reported to be in the entry of the mine where the explosion, believed to be due to gas or accumulated dust, occurred. The mine is near the Woodward company mine where many persons perished in an explosion in November.

The Birmingham district will be included in the itinerary of the fact-finding commission, it is officially announced from Washington. All coal-producing centers will be visited by the commission.

Applicants for positions as mine foremen and firebosses in Alabama mines will appear before the State Board of Examiners on Jan. 22 to 25. Charles H. Nesbitt, chief mine inspector, is chairman of the board.

D. A. Thomas, formerly vice-president and manager of sales of the Montevallo Mining Co., has become associated with the United States Fuel Co. in the capacity of vice-president. William H. Weller, Jr., is president of the company, which has been engaged in a general brokerage and sales agency business for the past several years, the capital stock recently having been increased to $25,000.

COLORADO

Colorado's production for November, 1922, was 1,000,554 tons compared to 835,235 tons of coal during November, 1921. The total production in Colorado from Jan. 1 to Nov. 30, 1922, was 8,841,103 tons, an increase of 354,398 tons over the production of the same period in 1921.

Although Colorado, now largely non-union, suffered less from coal strikes in 1922 than most of the states in the Union, it has been whispered about that **there may be serious trouble ahead in 1923.** All of these whisperings have been circulated following a visit of William Z. Foster, agitator and alleged member of the I. W. W. His unmolested speech on Soviet Russia to a gathering of radicals the last of the old year at the Painters' Hall in Denver gave rise to some worry in view of the fact that he was deported from the state during the coal strike last August. Foster returned to Colorado as soon as Governor William Sweet took office. The Colorado Rangers, active in preventing mine strike disorders last year, have practically dissolved under the new administration.

The Lackawanna Coal Co., of Denver, is taking over a lease on 400 acres of state school coal land east of the MacGregor mine in Routt County between Milner and Oak Creek, according to Horace W. Havens, mineral superintendent of the Colorado State Land Board. The Moffat tunnel activities have caused demand for leases in the Routt County coal district. The McNeil Coal Co., operating the MacGregor mine, is extending its operations by running a slope into a large body of state school coal land to the southwest. Its new lease provides that the slope will enter the school land in two years. This mine has 1,500 ft. to tunnel.

Most of the coal mines in the state are working on an average of **three days a week.** The ten Colorado Fuel & Iron Co. mines at Trinidad are working full time since the opening of the steel rail mills at Pueblo, nearly three weeks ago.

ILLINOIS

W. K. Kavanaugh has resigned as president of the Fifth and Ninth District Coal Operators' Association. He presented his resignation several months ago and it was recently accepted by the board of directors. Mr. Kavanaugh says his retirement was caused by the pressure of private business. The association elected as its president **Dr. C. H. Krause**, vice-president and general manager of the Willis Coal & Mining Co. **O. L. Lumaghi** has been chosen secretary. Dr. Krause has for many years been secretary of the association and in close touch with the conditions surrounding the industry in general.

J. O. Longley has opened a new strip mine on the J. S. Hopkins farm near Roodhouse.

The Gilchris Schuler Co. has options on 1,200 acres of coal lands northwest of Dahinda, a few miles from Galesburg. The land is adjacent to the Santa Fe tracks. The company has drilled 125 ft. and has touched two veins of coal. Drilling will be carried on to a 400-ft. depth. The land is ideally situated for a coal mine, as the river skirts one side of the tract and the railroad another. It is understood that the Santa Fe has been interested in procuring a mine site on its Illinois lines for some time.

The Illinois Coal & Coke Corp., of Chicago, has changed its name to the **Illinois Coal Corp.** It has increased its capital stock from $1,000,000 of no par value to $10,000,000 and classified the shares.

Carl Scholz, now of Charleston, W. Va., was in southern Illinois recently on business. He spent the greater portion of his time at the mine of the Valier Coal Co., Valier, where he was formerly located.

Eugene McAuliffe, until recently president of the Union Colliery Co., was a Chicago visitor early in January, explaining to important coal men and railroaders his plan for better distribution of cars to mines—a plan now getting consideration by the Interstate Commerce Commission.

The output of coal in Illinois in 1922 was 15,000,000 tons below that of 1921, according to the report of the State Department of Mines and Minerals. The 1,133 mines produced 63,276,827 tons last year, as compared with 78,339,082 tons in 1921. The coal strike of last summer was the cause of the decrease. The number of men employed was 98,090 and the average number of days worked was 134. The report showed 159 men were killed in the mines, as against 222 in 1921. There were 3,879 non-fatal accidents. Of the total tonnage mined, approximately 19,000,000 tons was consumed by railroads, about 38,000,000 shipped to market and 319,000 tons used locally.

A reward of $1,000 has been offered by the management of the **Perry County Coal Co. for the arrest of the vandals who damaged the tipple and cages** of their mine at Cobden. The hoisting machinery was started during the night and the cages run up and down until one became lodged in the rigging of the tipple which was considerably damaged. The other cage was forced down to the bottom of the shaft, where it was crushed. A valve on one of the boilers was opened, draining all the water. Fortunately, the fire was low and the boilers did not explode. Efforts also were made to demolish the electric generators, but a disconnected wire frustrated this. The company is at a loss to explain these acts of vandalism, as there has been no trouble at Cobden or at any other of the company's plants.

Announcement has been made that the mine of the Lowden Coal Co. at Pinckneyville, will be opened in the near future. Some time ago the mine was shut down because of failure to meet its payroll, but full settlement has since been made.

The **first coal shipment from the famous Lester strip mine** at Herrin since June 21, last year, was made late in December. The coal was shipped by the Caloric Coal Co., now owner and operating the mine where the Herrin massacre took place June 22, having purchased the strip from the Southern Illinois Coal Co., Chicago, of which W. J. Lester was president. The plant has been somewhat rebuilt, new tracks laid and the shovels, which were dynamited by the strikers last summer, have both been repaired and put into operation.

Extensive drilling operations are now being carried on in the vicinity of Vergennes, Jackson County, by the **Taylor Coal Co.** It is stated that a vein varying from 6 ft. to 8 ft. in thickness is found in the drillings. The deposit is known as the Big Muddy field, being only a few miles north of the Big Muddy coal fields at Murphysboro, now practically worked out. The tract being drilled by the Taylor company is near the Illinois Central and Missouri Pacific roads, and a mine sunk there would have the advantage of being served by both roads.

INDIANA

The Knox Coal Mining Co. has taken over the business of the **Worth-Huskey Coal Co.** and the **Ridge Coal Co.**, both of Chicago, and the **Carl Fletcher Coal Co.**, of Indianapolis. Both the Worth-Huskey Coal Co. and the Carl Fletcher Coal Co. have been sales companies and the Ridge Coal Mining Co. has been operating the Knox mine at Bicknell.

Charges of mulcting the city of Chicago involving Mortimer B. Flynn and the **Pottinger-Flynn Coal Co.**, of Chicago, are now being further investigated by a grand jury which has just discovered that Flynn made an $18,000 payment to Dr. William H. Reid, Commissioner of Public Service, said to have been a campaign contribution for Mayor William Hale Thompson's candidacy for re-election and that the Flynn company was granted by Reid a monopoly on the business of selling coal to Chicago, that only a small portion of it was on contract and the rest at "special rates," and a number of other significant facts. Flynn, who permitted his treasurer to be sentenced to jail rather than show the company's books, is now preparing to open those books to the investigators, for the grand jury probe into financial irregularities in Chicago's school department has widened and deepened astonishingly.

The Dodge Sales & Engineering Co., Mishawaka, which has for the past eight years been operating as the selling subsidiary of the Dodge Manufacturing Co. and Dodge Steel Pulley Corporation, has now been consolidated with the parent company, **Dodge Manufacturing Corporation**, which was organized and began business last July. The Dodge Manufacturing Corporation is the largest manufacturer of power-transmitting appliances in the world and is equipped to furnish stock products such as iron, steel and wood pulleys, pillow blocks, hangers, etc., as well as complete rope drives, flywheels and water wheel harness especially designed and constructed to meet the requirements of every industry. Distribution of Dodge products is made through fourteen branch warehouses in power-using centers, as well as hundreds of representative mill suppliers and jobbers. The Dodge Manufacturing Corporation also controls the Dodge Manufacturing Co., of Canada, Ltd., with head offices and works at Toronto, Ontario, and sales office at Montreal, Que.

A bill introduced in the House of the Indiana Assembly which would make it **unlawful to remove coal from the earth by the strip-mine process, unless refuse material removed from the excavation be filled back and leveled up** to conserve lands and surface for agricultural purposes, **had a short life.** Two days after its introduction action upon it was postponed indefinitely, on recommendation of the committee. The bill provided for a fine of from $500 to $3,000 and imprisonment of not more than one year for violation.

Indiana miners expect at once to begin a drive on the new Legislature in the interest **of re-enactment of a shotfirers' law** which will meet the objections to the law recently held unconstitutional by a decision of the State Supreme Court. The mine workers' organization contends that the contract between the United Mine Workers of America and Indiana operators, in effect until March 31, provides for the employment of shotfirers by the operators, and the miners will insist that this contract be carried out, regardless of the court opinion. According to the miners and operators, the only point involved in the controversy is the expense of maintaining a force of shotfirers. It was contended by friends of the measure at the last Legislature that the employment of special men for this line of work would create a body of experts in the use of explosives, making the work of miners safer.

IOWA

Tony Kauzlariah has purchased the Scott farm near Chariton, and has sunk a slanting shaft 175 ft. in depth and has struck coal at a depth of 100 ft. The shaft is down to the slate and rock. Borings have been made and it is thought the vein will measure not less than 4 ft. In time there may be some large coal mines south and northeast of Chariton as well as at Lucas.

Mine No. 4, at Williamson, near Chariton, broke records for hoisting coal recently when 1,858 tons were hoisted in one day at the rate of more than four tons per minute for the seven and one-half hours. No. 4 mine will soon be one of the foremost mines in Iowa as far as equipment is concerned. There are now being installed three mining machines which will increase the output to a large extent.

KANSAS

A local company has been formed to develop the coal field discovered last spring in Clark County, 16 miles southwest of Bucklin. A syndicate has charge of the work. H. P. McCaustland is trustee. The field is said to cover 20,000 acres of land.

The Tulsa County Coal Co., capital $50,000, has been chartered by B. C. Connor, H. O. Tallman and E. E. Henning They own a large acreage.

Governor Jonathan Davis, newly elected and a Democrat, in his inaugural message to the state Legislature, **declared against the Industrial Court law** of that state, a hobby of his predecessor, Governor Henry Allen. The Industrial Court has played a large part in recent coal history of Kansas.

Relief from the coal-car shortage in the southeastern Kansas field, within a few weeks was predicted by H. H. Brown, superintendent of the St. Louis & San Francisco R.R., testifying before Clyde M. Reed, chairman of the Public Utilities Commission, at Pittsburg. He said government inspectors had kept many locomotives tied up awaiting inspection. The Public Utilities Commission began an investigation of the coal-car situation in Kansas Jan. 3, inspired by complaints by dealers and operators of delayed deliveries as a result of weak transportation. One operator said he had received one car since Oct. 1. Another got 13 in six weeks. It was declared that the car shortage was the worst in history.

KENTUCKY

The Big Sandy field of northeastern Kentucky, in which the Northeastern Kentucky Coal Operators' Association holds sway, showed an **increase of about 500,000 tons production in 1922**, as compared with 1920, although the ratio of output to potential capacity showed a loss of about 3 per cent over 1920, due to the fact that potential capacity had been materially increased. At that the field made a nice showing. A report received from Ashland says in part:

"Out of a potential production of 15,354,175 tons for 1922, 6,056,227 tons were actually produced. In 1920, 5,514,359 tons were produced."

Nearly every coal-carrying road operating in Kentucky has placed **orders for additional coal cars** during the last few months. The B. & O. is placing order for 5,000.

Details of an alleged plan whereby the mines of **the Northeast Coal Co.** near Paintsville **were to be dynamited** and the carrying into execution of this plan with the consequent death of two miners, were revealed when William Spears, one of the men under arrest, turned state's evidence at his examining trial. The explosion in the mines occurred June 27, 1922. About 40 men have been arrested. The motive of the plot against the mines has not been made public.

The Scanlon Thompson Coal Co., capital $20,000, has been chartered by Sallie J. Thompson, C. W. Thompson and J. C. Hanna. The debt limit is $50,000. The company takes over the old Scanlon Coal Co. in Louisville, and will do a retail and wholesale business. It will handle eastern and western Kentucky coal, featuring product of the Jim Thompson Coal Co., Drakesboro, western Kentucky. The company has a good local business, calling for over 100 tons of steam coal daily in addition to its domestic, and has been jobbing six or seven cars a day.

Official result of the **election of officers of the United Mine Workers of District 23** were given out by union officials at Madisonville as follows: President, Lonnie Jackson, Central City; W. D. Duncan, Central City, member international executive board; Wes Ames, Central City, vice-president; H. H. Vincent, secretary-treasurer; auditors, S. J. Watson, Madisonville; J. H. Johnson, Nelson, and Robert Calloway, McHenry; tellers, J. W. Blackburn, McHenry; W. B. Swope, Morton's Gap, and Rich Russell, Providence. R. C. Owen, McHenry, delegate to State Federation of Labor. Eight district board members were elected as follows: W. C. Hobgood, Henderson; L. G. Smith, Drakesboro; R. M. Nance, Providence; James L. Dunlap, Earlington; E. M. Harden, McHenry; John Duncan, Central City; Roy Hobbs, Baskett; Charles Smith, Cleaton.

F. M. Sackett, of the Speed interests, operating a number of Kentucky mines, jobbers' offices and the Byrne & Speed Coal Co., large retailers, with several local yards, was re-elected president of the Louisville Board of Trade on Jan. 10 at the annual meeting. It is his third term as president, he having resigned the first term to enter federal service during the war, as a dollar-a-year man.

Louisville shippers and the coal interests are much pleased with the announcement of the purchase of control of the C. & O. by the Van Sweringen interests of Cleveland. The C. & O. enters Louisville from Lexington over the L. & N., but is a big factor in the Big Sandy coal fields of the state, and it is believed that under the Van Sweringen control and working in conjunction with the Nickel Plate and other lines under the same control the road will show more rapid and better development.

The Chavies mine of the Bermuda Coal Co., at Chavies, was opened recently. This mine is on the L. & N. R.R.

MARYLAND

The Brydon Brothers Coal Co. has been incorporated at Cumberland, with a capital stock of $800,000. The incorporators are Harry G. Fisher, Harold K. Wood and D. Lindley Sloan.

MINNESOTA

The Minnesota State Legislature, which has just convened, will receive a recommendation that **dealers in coal, both wholesale and retail, be licensed** and be required to make monthly reports of their stocks on hand and the prices asked. The purpose is to keep tab on stocks as well as prices and to watch for profiteering.

Although the Fuel Commissioner has retired from his duties, the local committee in Minneapolis, formed to aid in the work, will continue to function.

Carl Jaeger, of St. Paul, president of the Lignite Industries Corporation, has gone to Germany, to approve **machinery for extracting chemicals from lignite in Texas and North Dakota**. The machinery has been ordered for some time and will not be shipped until approved. One lot will go to Greenville, Texas, and the other to some unnamed point in North Dakota. The machines are for refining lignite, extracting byproducts from coal tar as well as producing the coal tar itself.

The United States Chamber of Commerce has been having **a survey** made in these cities as well as elsewhere, **to establish the exact needs of the Northwest** as to coal for next winter.

A South St. Paul dealer who was **convicted of giving short weight** on three sales of coal, was **sentenced to 90 days in jail**, the heaviest sentence ever given for short weight in this state.

MISSOURI

The Kolb Coal Co., of St. Louis, has just purchased some 30-yd. western dump cars and a 6-wheel switch engine for use at its mines for storage purposes.

Robert Collett, for the last few years in the fuel department of the New York Central lines at New York City, assumed the duties of fuel agent of the Frisco system at St. Louis Jan. 15, **succeeding J. C. Bryan**, transferred to the mechanical department in charge of the shops at St. Louis. Mr. Collett was with the Frisco prior to the war under Eugene McAuliffe.

C. C. Wall, of Detroit, has been assigned to St. Louis by the I. C. C., succeeding C. D. Thomas. The business and coal bureaus of the service section are demanding a permanent office at St. Louis.

Articles of incorporation have been filed as follows in the office of Secretary of State Charles U. Becker: **Star Coal Co.**, Kansas City; to mine, prepare for market, transport and sell and deal in coal and other minerals incidentally developed; capital, $50,000 and 1,000 shares no par value; incorporators: S. S. Serat, M. H. Serat, G. B. McPherson. E. R. Dusky and A. F. Evans. **Midland Valley Coal & Material Co.**, Overland; to buy and sell feed of every kind, lime, sand, cement, lumber, iron, steel and all kinds of building and construction material, ice, coal, coke, wood and every kind of fuel and do a general construction and building business; capital, $25,000; incorporators, M. J. Tracy, W. P. Pohrer and M. J. Mohan. **American Ice Co.**, Kansas City; to do a general mercantile business, wholesale and retail or both; to buy and sell coal and wood; manufacture, buy, sell ice, refrigeration and cold storage; capital $25,000; incorporators, H. L. Burk, A. J. Stewart and H. F. Roosa.

NEW YORK

William A. White has resigned from the editorial staff of *Coal Age* and become associated with the Morrow Callahan Coal Co., recently organized, with omces in New York, Pittsburgh and Cincinnati. For the last two and a half years Mr. White has been market editor of *Coal Age*, having joined its staff Aug. 1, 1920. He will be in charge of the paper and pulp-mill department of the Morrow Callahan company, with headquarters in Cincinnati. He has had long experience in the coal trade, having started with his uncle, C. P. White, in the Carnegie Coal & Dock Co., some ten years ago. He also has been engaged in the coal trade in the Northwest, Ohio and the South, and enjoys a wide acquaintanceship in many other parts of the country.

WILLIAM A. WHITE

The Joint Committee on a National Museum of Engineering and Industry appointed by the four Founder Engineering Societies of United Engineering Society, 29 W. 39th Street, New York, is composed of Edward D. Adams and Charles L. Clarke, of the American Institute of Electrical Engineers; Frederic A. Delano and Dr. George F. Kunz, of the American Institute of Mining and Metallurgical Engineers; Clemens Herschel and Nelson P. Lewis, of the American Society of Civil Engineers, and Reginald Pelham Bolton and Holbrook Fitz John Porter, of the American Society of Mechanical Engineers, the latter acting as chairman. This committee in co-operation with the National Museum of the Smithsonian Institution at Washington, D. C., is **formulating a plan for a great National Museum of Engineering and Industry** similar in character to the foreign museums, especially the Science Museum at South Kensington, London, England; Conservatoire des Arts et Metiers at Paris, France, and Deutsches Museum at Munich, Germany. The co-operation has been secured of the Federated American Engineering Societies and of the leading industries. It is expected that every engineer and industry in the country will eventually join in the development of this educational project.

NORTH DAKOTA

Tests of the use of North Dakota lignite for industrial and commercial use are to be made soon. The lignite operators propose an intensive campaign on behalf of their product.

The Legislature of North Dakota set Jan. 16 as a day devoted to an **intensive study of the natural resources of the state**, aside from agriculture, and especially in coal and clay deposits.

OHIO

Robert Farmer, vice-president of Subdistrict No. 5 of the Ohio Division, United Mine Workers, has been acquitted of the charge of first degree murder in connection with the killing of John I. Majors, a non-union miner, at New Lafferty last June.

The Columbus Board of Purchase opened bids Jan. 17 for 7,500 tons of nut, pea and slack for the municipal light plant; 3,500 tons of the same grade of coal for the water works department and 2,000 tons of the same for the garbage-disposal plant. The Boblo Coal Co., Pittsburgh, bid $2.95 f.o.b. mines for the entire tonnage; the New York Coal Co., Columbus, bid $2.75 for 7,500 tons for the light plant; the F. M. Spencer Coal Co., Columbus, bid $2.85 for 3,500 tons, and the Hisylvania Coal Co., Columbus, bid $2.75 for 2,000 tons for the garbage-disposal plant. The contract probably will be awarded soon.

The Monaco Coal Mining Co., of Robyville, has been chartered with a capital of $100,000. Stockholders are Oliver Monaco, Domenick di Rienzo, Jesse Beck, Sicto Ferrusi and Juliette Monaco.

The County Commissioners of Columbus have awarded the contract for 3,500 tons of mine-run for Memorial Hall, the County Infirmary and the Court House to the Colonial Coal & Supply Co., at $5 per ton delivered on the infirmary switch and $5.95 per ton delivered at the Memorial Hall and the Court House. This is Cambridge coal and is $1 per ton more than the bids on Hocking.

The Hisylvania Coal Co., of Columbus, which has been operating mines at Glouster has taken over the selling of the coal produced by the Penn Coal Co., of Crooksville; the Piney Fork Coal Co., of Piney Fork, Jefferson County, and the Panhandle Collieries Co., also of Jefferson County, all of which are controlled by the same interests. Formerly all of the producing companies maintained sales organizations. J. W. Blower is president and E. W. Blower, secretary of the company.

The Cincinnati Coal Mining Co., owner of a coal lease in Athens County, was directed by the Franklin County Common Pleas Court to pay royalties in the sum of $2,575 to the owners of the fee, although no coal had actually been mined in months. This royalty was paid until March, 1920, when the company gave notice that it would not longer be bound by the terms of the lease.

An attachment of $3,149.43 in the hands of H. D. Everett, trading as Western Coal Co., sued out by the plaintiff in the suit of the **Tribbey Coal Co.** vs. the **Kanawha Valley Coal Co.**, was discharged when the defendant filed bond for $8,500 in the U. S. District Court in Cincinnati. District Judge John Weld Peck made an order directing Everett to pay the money in his hands over to the defendant.

OKLAHOMA

The Oak Ridge Coal Co., capital $200,000, has been organized by Vince Davis, Ray Morgan, James Hilling and others to sink a mine at Red Oak.

The distance a machine crew shall move coal cutting machines within a mine without additional pay was established at **900 ft.** by W. L. A. Johnson, commissioner of the Southwestern Coal Operators' Association, and John P. White, former International president of the United Mine Workers, at a conference in Kansas City, Dec. 27. If the distance exceeds 900 ft. the men will be paid for the actual time required to move the machine, at day-wage scale. It was a dispute over this question that resulted in 800 miners in six mines of the Crowe Coal Co. in the Henryetta (Okla.) field walking out Oct. 23. They returned to work Nov. 13, pending a settlement.

PENNSYLVANIA

Consolidation of numerous individual coal interests in Indiana, Jefferson and Armstrong Counties into a corporation capitalized at $100,000, fully subscribed, under the name of the Punxiana Coal & Coke Co., with headquarters in Indiana, Pa., has been accomplished. The new company represents the consolidation of the Rinn, Ritter, Winslow, Sutter, Snyder and Lorenzo interests into a sales agency to market the product of fourteen mines formerly owned and operated by the individual firms. The Punxiana company now has a daily output of more than 3,000 tons. With the completion of present plans the production will be practically doubled. The plans call for the operating of the present operations and the development of new mines. The incorporators are Lafayette F. Sutter, J. Cloyd Rinn, Harry A. Snyder, Dr. Daniel Ritter, W. H. Ritter, C. Kempton Sutton, all of Indiana, and E. H. Winslow, Dr. F. A. Lorenzo and J. H. Ritter, all of Punxsutawney. Dr. Daniel Ritter is president and Harry A. Snyder treasurer of the new company. Mr. Snyder recently resigned as general manager of the Savans Collieries Co. The mines are located on the lines of the B. R. & P., Pennsylvania and B. & O. The new company will control 13,000 acres of unmined coal in the three counties and include the Upper and Lower Freeport, C Prime and Miller veins. There will be a branch office in Punxsutawney under the direction of E. H. Winslow and there will be sales representatives in Eastern cities.

The Western Pennsylvania Division of the National Safety Council is holding a series of winter meetings on the subject of **"Safety in Mining"** with Messrs. A. R. Pollack, J. T. Ryan, W. F. Affelder and Francis Feehan supervising the course, which proves very interesting.

Richard Maize, president of the Coal Mining Institute of America, was a recent Pittsburgh visitor.

Edward T. Devine, of New York, a member of the United States Coal Commission, spent two days in Johnstown recently. While there he met John Brophy, president, and James Marks, vice president, of the U. M. W. He was also in conference with A. B. Crichton, Harry J. Meehan and other operators. He was on his way west, and the object of the visit was to get into personal touch with facts and conditions in the central Pennsylvania field.

Governor Pinchot has named Joseph J. Walsh, a mine inspector of Wilkes-Barre, **as chief of the Department** of Mines to succeed Seward E. Button, Wyoming. The salary is $6,000 a year and the term of the new chief began Jan. 16 with the opening of the new state administration. In announcing the appointment the new Governor said: "Mr. Walsh was selected purely because he is the most efficient and competent mine inspector in Pennsylvania. Politics had no part in his selection and should have none in a case like this where the lives of men are at stake." The new chief of mines was born at Pittston in 1874. He entered the mines as a door boy, attending night school in the meantime. He went to the Mansfield State Normal School for two years and then returned to the mines, working at various occupations. He qualified himself in a knowledge of mining engineering, ventilating engineering and chemical engineering in a correspondence school. Mr. Walsh has recently been mine inspector in the Fourteenth Anthracite district of Pennsylvania, a position he held for eighteen years. During 1908 he established the Mining Vocational School at Nanticoke, and has been its supervising principal. The school was started with twenty students and developed into a general school with 1,300 pupils. He is the author of a book entitled, "Physics and Chemistry of Mining and Mine Ventilation."

The American Coke Corporation, of Pittsburgh has purchased the abandoned Struthers plant of the Struthers Coal & Coke Co., of Cleveland, Ohio, located at Fairbanks, Fayette County. The houses at this plant will be used in connection with the Orient plant of the American Coke Corporation, at Orient, near by, and the equipment that is usable will be moved to the various plants of the American Coke Corporation as needed.

The annual report of the State Workmen's Compensation Bureau for 1922, just issued by Clifford B. Connelley, Commissioner of Labor and Industry, shows **there were 146,255 accident reports received, an increase of 6,058 for the year** as compared with 1921. Compensation incurred last year totaled $10,853,344, the compensation for fatalities being $5,062,490, for personal disability, $2,226,364 and for temporary disability, $3,564,490. The effect of the mine and rail strikes resulted in a decrease in accidents during the summer months in public service and mine reports. In 1921 there were 904 fatal and 49,852 non-fatal accidents in the mines while in 1922 there were 808 fatal and 35,804 non-fatal accidents reported from the mines.

More than $2,000,000 of the estimated $3,250,000 due the state **in anthracite coal taxes for 1921 has been paid into the State Treasury.** Among the recent checks received were about twenty from river coal-dredging companies. These represent about one-half of the companies that reclaim anthracite from the rivers in the eastern part of the State. Some payments were made under protest, the companies contending that they are not mining coal. In all, seventy-five of the 230 companies subject to the tax have paid. The largest single payment has come from the Lehigh Valley Coal Co., whose check was for $285,665.65. Coxe Brothers & Co., Inc., recently paid $68,394.76. Blanks for the reporting of the amounts of anthracite produced and the assessment values of 1922 have been sent out and are returnable by Feb. 1.

The following bituminous coal companies were incorporated at the State Department at Harrisburg recently: **George H. Foster Coal Co.**, mining and producing coal and manufacturing coke, Pittsburgh, capital $25,000; treasurer, E. E. Beardsley, Point Marion. Incorporators: George H. Foster, Pittsburgh; E. E. Beardsley, Point Marion, and H. E. Hackney, Uniontown. **Monyough Coal Co.**, mining coal and manufacturing coke, Pittsburgh, $50,000, W. F. McNaugher, treasurer. Incorporators: W. F. McNaughter, R. E. Moore and A. J. Fersch, Pittsburgh. **Phoenix Coal & Coke Co.**, Pittsburgh, dealing in coal lands and operating them, $10,000, Harold C. Schade, Crafton, treasurer. Incorporators: Harold C. Schade and R. C. Schade, Crafton, and Haven V. Wolf, Wilkinsburg. **Dunlap Coal Co.**, Claysburg, mining, preparing and shipping coal and fireclay, $25,000; Fred S. Dunlap, Claysburg, treasurer. Incorporators; Thomas N. Kurtz, Hollidaysburg; Louis G. Kurtz and Fred S. Dunlap, Claysburg. **George Coal Mining Corporation**, mining, buying, preparing and shipping coal; Hastings, $75,000; George A. Clark, Hastings, treasurer. Incorporators: L. S. Clark, Cherry Tree; George A. Clark and A. S. Slater, Hastings. **Wheaton Coal Co.**, mining, selling and dealing in coal, leasing, buying and selling coal lands; Philadelphia; $30,000; Guy L. Wheaton, Philadelphia, treasurer. Incorporators: Guy L. Wheaton, J. G. Allspach, Jr., Philadelphia, and W. Elbridge Brown, Clearfield. **Burlner Coal Mining Co.**, mining, operating and leasing coal lands; Philadelphia; $50,000; Vance H. Burtner, Osceola Mills, treasurer. Incorporators: Vance H. Burtner, Harriett L. Burtner, Philadelphia, and Joseph W. Mills, Philadelphia. **Broad Top Coal Co.**, mining coal and manufacturing coke, P. O. Six Mile Run, Pa., $250,000; J. Orville Hoover, Woodbury, treasurer. Incorporators: John L. Longnecker, George W. Clouse and G. C. Imler, Woodbury.

RHODE ISLAND

The New England Coal Co., Woonsocket, has recently incorporated under the laws of Rhode Island, to engage in the coal business, with a capital stock of $30,000. The incorporators are Albert A. Hudson, George M. Rex, and Harry E. Davis, all of Woonsocket also.

UTAH

Judge Hansen has **denied motion of coal operators** and lumber dealers **to quash indictments** returned by the district grand jury last autumn, following charges of price fixing. Date for trial has not been set yet. Most of the big companies in both industries are involved.

The Utah Products Co. is the name of a new Utah corporation which has filed articles showing a capital of $100,000. The idea of the promoters is **to get a maximum value out of Utah's coal mines, reduce the price of all fuel in the state**, and incidentally, to solve Salt Lake City's smoke problem. Patent rights covering the whole of the United States have been taken out, although, for the time being at any rate, the activities of the concern will be confined to Utah. The process is the work of years of labor on the part of J. C. Fenton, a former instructor in chemistry at the University of Utah. It is asserted that the coal men were willing to take over the project, but that the exclusive rights they demanded were not granted.

The Spring Canyon Coal Co., operating the Spring Canyon mine in Carbon County, **has been taken over by James B. Smith** and associates, of San Francisco. The company has a capital of $1,000,000. J. William Knight, a resident of Provo, was president and general manager. He will continue to be associated with the company as vice-president. J. A. Stallings will remain as sales agent. James B. Smith acquired an interest in the Knight company a few years ago and has since been selling the coal on the Coast through an organization at San Francisco known as the King Coal Co. The Spring Canyon company was organized in 1912 by "Uncle" Jess Knight, Mr. Knight's father and has been successfully operated.

The Columbia Steel Co. has filed articles of incorporation showing $20,000,000 capital. Plants of the company will be built in Utah County between Provo and Springville. The Pacific Steel Co. also may locate there.

WEST VIRGINIA

The Consolidation Coal Co., of Fairmont, W. Va., announces the appointment of George W. Hay as general manager of their Elkhorn division, which position was left open by the death of John G. Smyth. It will be recalled that Mr. Smyth was killed Sept. 21, 1922, by a fall of slate in a small mine, of which he was part owner, but not the property of the Consolidation Coal Co. Mr. Hay has had charge of the McRoberts operations of the division, and has acted unofficially as general manager up to this time. By promotion H. S. Carpenter has been appointed general superintendent and has charge of the McRoberts operations. John F. Daniels, who formerly was superintendent of 204 and 205 mines, has become assistant general superintendent, and James L. Evans, formerly mine boss of 204 mine, is now superintendent of 204 and 205 mines.

D. A. Reed has been appointed general manager of the West Virginia division of the Consolidation Coal Co., **C. H. Tarleton** being the general manager of that division. Promotion of Mr. Reed has also meant the promotion of five other employees of the company. The office of assistant general manager was created, as of Jan. 1, because of the ever increasing duties devolving upon the general manager of the division. Mr. Reed has been with the company for more than 20 years, having entered its service as a messenger boy. **W. J. Wolf**, who has been associated with the company since 1915, has succeeded Mr. Reed as superintendent of the Monongah mines. **F. H. Brooks**, who entered the service of the company as a trapper boy, has been promoted from the post of superintendent at the Carolina mine to Idamay to succeed Mr. Wolf. Mr. Brooks has been succeeded as superintendent at the Carolina plants by **R. H. Kann**, now superintendent of the Wyatt plant of the company. Mr. Kann entered the service of the company as a miner. **E. B. Courtney** has been promoted from the post of superintendent of mines Nos. 21 and 91 at Gypsy to the position as superintendent at Wyatt, succeeding Mr. Kann. **I. W. Robinson**, who has been with the Consolidation for 20 years, became superintendent of mines 21 and 91 at Gypsy.

Judge J. B. Sommerville, in the Circuit Court of Brooke County, has sentenced **Peter Radakovitch** and **Teddy Arunski**, of Avella, Pa., to serve ten years in the West Virginia penitentiary—the maximum sentence—following their conviction on the charge of conspiracy in connection with the attack on the Cliftonville mines last summer. Appeals will be taken to the Supreme Court of West Virginia. The defendants mentioned above were the first two to be tried on the conspiracy charge. There are more than 200 other miners who will be arraigned on similar charges. It was in the defense of the Cliftonville mine that Sheriff H. H. Duvall, of Brooke County, was killed.

The following West Virginia coal companies have **increased their capital stock** in the amounts named: Pemberton Fuel Co., of Mt. Hope, from $100,000 to $200,000; Prince-Wick Coal Co., of Mt. Hope, from $150,000 to $300,000; J. E. Long Coal Co., of Clarksburg, from $100,000 to $150,000; Tierney Mining Co., of Powhattan, from $15,000 to $450,000; Long Fuel Co., of Clarksburg, from $75,000 to $350,000; Costanzo Coal Mining Co., of Wheeling, from 8,000 shares to 20,000 shares without par value; J. E. Long Coal Mining Co., of Clarksburg, from $25,000 to $100,000; Interstate Fuel Co., of Clarksburg, from $50,000 to $100,000. The Norfolk & Chesapeake Coal Co., of Columbus, Ohio, has been authorized to increase its capital stock from $100,000 to $200,000. The Elk Ridge Coal & Coke Co., of North Fork, has been granted authority to reduce its capital stock from $150,000 to $75,000.

In addition to the usual quarterly dividend of $2 a share, the directors of the **Island Creek Coal Co.**, have declared an extra dividend of $5 a share.

The sum of $250,000 is being expended by the **Ben Franklin Coal Co.** at its Parkersburg docks for the construction of river transportation equipment, which will include thirty-five timber barges to be used in the transportation of coal from the mines of the company at Big Grove Creek, opposite Moundsville.

The Secretary of State of West Virginia has granted authority to the following coal companies to increase their capital stock in the amounts named: **Irona Coal Co.**, of Philadelphia, from $100,000 to $500,000; **Dawson Coal Co.**, of Philadelphia, from $200,000 to $800,000; **Rosemont Coal Co.**, of Philadelphia, from $350,000 to $1,000,000; **Richland Mining Co.**, from $200,000 to $600,000; **Monongah Fuel Co.**, Monongah, W. Va., from $50,000 to $450,000.

The Row Coal Co., of Junior, has filed articles of dissolution with the Secretary of State of West Virginia and has gone out of business.

The Central Coal Mining Co., of Charleston, has acquired 800 acres of coal land along the Ohio, south of Bellaire, and plans to double its present output.

S. A. Moore, of Charleston; J. D. Smith of Hamlin, and others have formed the **Hartford Fuel Co.** at Hartford, with a capital of $100,000.

The Red Jacket Consolidated Coal & Coke Co. at Red Jacket, under the management of William N. Cummins, is planning to develop 12,000 acres of coal land with a daily output of 3,000 tons. H. T. Wilson of Detroit, Mich., is president of the company.

The Wheeling Coal Co. has been incorporated at Wheeling, by Edgar Aaron, A. J. Gilleland and G. A. Blackford.

H. R. Greist, of Ebenburg, Pa., has obtained option on 5,000 acres of coal land in Wood County.

Counsel for the state and for the defense have agreed to **Postpone the trial of C. Frank Keeny**, president of District 17, United Mine Workers, charged with being an accessory to murder. Feb. 19 has been agreed upon as the date when Keeney will be brought to trial.

Attorneys for the defense in the case against **Walter Allen**, convicted of treason, **have filed a bill of exception** in Judge J. M. Woods' court at Martinsburg for certification to the State Supreme Court. Attorneys for the **Rev. J. E. Wilburn** and his son **John Wilburn**, both of whom were convicted for murder, have announced that similar action will be taken as to their clients. **Walter Allen**, who was found guilty of treason, has forfeited his bond and is now a fugitive from justice.

WYOMING

The Peerless Mine of the M. H. Shields Coal Co., at Gillette, recently was opened. It is a new mine on the C. B. & Q. R.R.

The Poposia No. 1 Mine of the Poposia Coal Co., at Lander, was reopened on Dec. 1. It was closed on April 1, the engine and boiler being destroyed by fire during the strike. It is on the C. & N. W. R.R.

CANADA

According to figures just issued the **production of coal for October** of 1922 in Alberta **was the largest for any one month** in the history of the industry in that province. Output up to the end of October last, compared with the same period of the preceding years, was as follows: In 1921 a total of 4,610,301 tons; in 1923 a total of 4,250,824 tons. In the month of October, 1922, a total of $26,752 tons was produced, compared with only 588,291 tons in October of 1921.

The International Fuel Co., Limited, has been organized in Toronto and has been granted a charter authorizing it to engage in a wholesale coal business and to acquire coal mines, etc. The authorized capital is $40,000 and the provisional directors are: G. M. Malone, Albert Mearns and G. Wallis.

A permanent body of government experts to be known as the **Dominion Fuel Board has been created** by an order-in-council at Ottawa. Its members are Charles Camsell, Deputy Minister of Mines; John McLeish, director of the mines branch; B. F. Haanel, chief of the fuel testing division; D. B. Dowling, geologist; J. B. Challies, director of the water-power branch, and F. C. Lynch, superintendent of natural resources' intelligence. The board is authorized "to secure all available data and to consult and co-operate with such individual bodies as they may deem specially qualified to advise upon any particular phase of the work."

The federal government will be asked to establish by law for the miners of Alberta **a minimum scale of wages and six-hour day with a five-day week**, Saturday to be a holiday, following a decision of the Alberta Federation of Labor, at its concluding session held in Medicine Hat, Jan. 12. It is also asked that first-aid stations be established inside the mines.

Imports and exports of coal during the calendar year 1922 are given in a summary just issued by the Dominion Bureau of Statistics. The totals for both are considerably below the average for the preceding three years, as shown in the following figures:

Canadian Coal Exports and Imports
(In Net Tons)

	Calendar Year 1922	3 Yr. Average 1919-21
Anthracite imports	2,692,731	4,817,536
Bituminous imports	12,562,888	13,816,457
Coal exports	1,818,582	2,205,183

The Coderre Cup, a valuable trophy offered by the St. John Ambulance Association for competition by teams of miners in first-aid, has been won this year by No. 1 team of the International Coal & Coke Co., of Coleman, Otta. The next in order was team No. 1 of the Western Fuel Corporation, Nandimo, B. C. The cup, emblematic of the miners' first-aid championship of Canada, is named after the donor, Judge Coderre, formerly Canadian Minister of Mines.

Coming Meetings

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

Traffic News

A saving of approximately $1 per ton to retail dealers in interior Iowa points on anthracite shipped is seen in a decision handed down by the I. C. C. whereby the **roads must route such coal into Iowa at Class D rates**. The decision was made following a hearing of the case held last September in Des Moines. The case grew out of the railroads suspending the Class D rates without permission of the I. C. C. This permitted them to charge from 75c. to $1 per ton more on hard coal from Eastern points into Iowa.

The Coal, Coke and Iron Ore Committee, Central Freight Association Territory, announces a public hearing, 10 a.m. Feb. 1 **to consider cancellation of rates** on coke, coke ashes, coke breeze and coke dust, in carloads, to Moline, Rock Island, Ill., Davenport, Iowa, and Omaha, Neb., in connection with C. B. & Q., C. M. & St. P. and C. R. I. & P. Rys., from origin stations in the Clairton, Connellsville and Gallitzin districts, as set out in Penna R.R. tariff AA ICC 1843. The hearing will be held at Room 606, Chamber of Commerce Building, Pittsburgh, Pa.

In a tentative report made by Examiner Fleming, of the Interstate Commerce Commission, a new relationship of coal rates is prescribed on the Louisville & Nashville R.R. from mines in western Kentucky to points in the Northwest.

In Service Order No. 35, issued Jan. 15, the Interstate Commerce Commission instructs the Norfolk & Western Ry. to assign eight cars per day for ten consecutive working days, beginning Jan. 17, at any one of the following mines: Baby, West, Boissevain, Caswell Creek, Cherokee, Lick-Branch-Shamokin, Norfolk-Angle, Rolf, Sagamore Nos. 1 and 2, Delta, Pocahontas Nos. 6, 7 and 8, and Pulaski of the Pocahontas Fuel Co.; Elkridge Mine, of the Elkridge Coal & Coke Co.; Roanoke Mine, Roanoke Coal & Coke Co.; Booth-Bowen Mine, Booth-Bowen Coal & Coke Co. The cars are not to be counted against the distributive share of the mines. The coal is for delivery at the United States Navy Yard at Portsmouth, Va.

Obituary

Edward Savage, aged 83, the last survivor of the historic Blue Rock Mine disaster, died at his home in Crooksville, Ohio, recently. He was one of a number of men imprisoned for 14 days and 13 hours in the Blue Rock Mine and rescuers tunneled through 400 feet of earth and rock to reach them. The men had lived on the contents of two dinner pails, four quarts of water and some sulphur water which had trickled through the rocks.

Death has claimed **Don Carlos Robbins**, well known Utah geologist and adviser to coal companies of the state. He was 71 years of age and was born in Salt Lake City.

William W. Jackson, coal operator, with holdings at Dunshore, Sullivan County, died of apoplexy Jan. 9 at his home in Williamsport, Pa. He lived alone. Two daughters of Memphis, Tenn., and a sister, survive.

Edward J. Robinson, one of the founders of the Globe Coal Co., of Indianapolis, and prominent in business and political circles for many years, died recently from complications following the accidental discharge of a shotgun, the charge entering a knee. At first it was not thought the wound was more than painful, but acute nephritis caused a rapid decline. The widow and one son survive. Mr. Robinson was a Republican candidate for the nomination for Mayor at the last primary, but was defeated.

D. E. Martin, a member of the Martin & Hubbell Coal Company, who had been a resident of Kansas City, Mo., for about 35 years, died at his home in that city. He was sixty years old. A widow survives. Mr. Martin was born in Gallatin, Mo., and was well known throughout the northwestern part of Missouri.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, THURSDAY, FEBRUA RY 1, 1923 Number 5

Spragging the Wheels of Justice

STOPPING the Herrin appropriation in the Illinois Legislature was a forlorn hope, but the United Mine Workers' officials in that state attempted it anyway. Flushed with their success thus far in thwarting justice in the Herrin massacre case, and therefore caring less than ever what honest citizens think of them and their organization, they demanded that no appropriation be made. This, of course, would not have halted the prosecution. Ample private funds from business men and citizens of all degrees throughout the state are at the disposal of the Attorney General.

The only hope the miners could have had was merely to hamper the prosecution with riders to the appropriation bill. They would have compelled Attorney General Brundage to declare what he was going to do with every dollar of the $75,000. Would they reveal what they are doing with every dollar of their own $250,000 fund? And they would have required the state to prosecute for murder W. J. Lester, the foolish operator who imported armed guards for his Herrin strip mine. Yet since the very day of the massacre—June 22, 1922—they have done everything in their power to prevent all operation whatsoever of the machinery of justice. They want no more prosecution of that case or any phase of it. Such action is dangerous. What they want for the Herrin massacre is oblivion.

Why Russian Methods?

HOW much does Ellis Searles know about coal mining? But then how much does Heber Blankenhorn?

Mr. Blankenhorn, associated with the Bureau of Industrial Research of New York, is credited with a large responsibility for the "How to Run Coal" pamphlet, recently issued, being the report of the Nationalization Research Committee of the United Mine Workers, signed by John Brophy, C. J. Golden and William Mitch, all true-hearted and honest-to-goodness coal miners.

This nationalization plan, however, seems to have fallen from grace in quarters where it might have occupied high place. It got away to good publicity on the second try and was quite generally scored by the press. It developed no popularity. The cheers in fact were confined to Greenwich Village and those crabbed individuals who derive selfish pleasure in baiting business. The country wants to know more about the controversial points on coal before it jumps to nationalization. This sentiment the officers of the United Mine Workers sense. They privately and publicly concede that those who urge a policy of governmental ownership and operation of coal mines are several generations ahead of the times. Hence why bring down on their heads unnecessary public condemnation for a program that is not now practical; hence their implied repudiation this week of the nationalization program of Mr. Brophy and Mr. Blankenhorn.

The United Mine Workers is taking pains to inform the country that it is not "red," not even faintly tinged with pink. Well and good. It is no discredit to the miners' union that some of its members are so rosily minded. We know people holding "white-collar" jobs, ex-bankers who, having accumulated their pile, can indulge themselves in euphonious declamations of highly altruistic sentiments and others less rich in dollars whose thinking is simply twisted, who are as "liberal" in their thinking, talking and writing as those who wrote and signed "How to Run Coal."

The United Mine Workers has demonstrated it can get what it wants for its members by application of the American method, so why try the Russian?

Central Competitive Field Re-established

ASIDE from the fact that the settlement between the union and the soft-coal operators at New York last week insures peace for the next year, the agreement is chiefly interesting as demonstrating the supremacy of the old school of wage negotiation. For more than a year there has been developing a movement to broaden the scope of the negotiations with the United Mine Workers. From the time that the Central Competitive Field was originated, in the late 90's, until 1917 the machinery was simply and fairly effective. Operators from four states, western Pennslvania, Ohio, Indiana and Illinois, met with the miners' union once every two years. These operator groups had no prior conferences, no agreed program, no common policy. They just came together at the call of the United Mine Workers to negotiate a wage agreement and contract for the ensuing two-year period.

Thus has the old school worked. Thus was the stronghold of the United Mine Workers strengthened. Other coal fields outside the Central Competitive were organized and their wage levels changed in consonance with the central field, but always as a consequence thereof and never independently. So long as wage changes were small this caused no pronounced hardships. It was only when the upward march of wages, beginning in 1917, reached its climax in 1920 that the thin coal areas in and outside the old central field felt the pinch.

The desire of the "outliers" to share in the councils of the old central field is not new. It was strongly manifested and strenuously denied in 1919. It was debated and discarded in the conferences that began in October and ended in New York last week. The past year has been remarkable in that it witnessed the withdrawal of Pittsburgh, one of the old group, with a deliberate policy of aloofness, "of splendid isolation," on the

one hand, and on the other the effort to bring all operators in organized fields into one group in the matter of wage-making policy.

Such an opportunity for a shift in the organization dealing with the miners as was presented by the settlement of 1922 may not come again in many years. The old central field was for the time removed from the stage; all were on an equal footing, every group had signed individually with the union. When, during the meeting in Chicago the first week of January, the effort was made to turn the conference, in which each of the fifteen wage districts of the country was represented, into a scale-making body and the effort lost by the margin of a few votes, the opportunity was lost—the only thing gained from the wreck of the strike of 1922 was thrown away. If the operators from all the organized fields of the country could not get together to discuss wages, then the return to the old Central Competitive Field conference was natural and to have been expected.

The New York agreement of this year reinstated the Central Competitive Field as a basic wage-making body. That there were but three states in the conference had no more effect on this fact than that there were but three in 1906, when Illinois withdrew, for a time. Furthermore, these present three appear to have put themselves in the way of returning at the expiration of the new agreement for the purpose of making the next scale. The old processes have been re-established. With a wage program laid out in advance by the Coal Commission, from which there is no deviation as a result of the New York conference, it would have been as simple for each district to sign alone or for all to join.

The old school triumphed, Pittsburgh, invited to join but refusing, maintains an independence that for another year at least has but limited value. The lone hand in this game is the hardest to play. The outliers, refused admittance, must await another opportunity, meanwhile developing and promoting the idea of better organization among the soft-coal operators in wage making.

Better Track

LITTLE has been written as to better track, but the subject is one that will bear much consideration. Time was when mine traffic was so light and trips ran so slowly that the track was not destroyed by use. That distressing function was left to time and to the corrosion of mine water. With our mine roads as with our highroads, weight and speed are replacing natural forces as the chief destructive elements. While not neglecting to correct the heaving of the bottom, its softening by moisture, the displacement of track by side movement of the clay, the destruction of rail by corroding waters and electrolysis we must not fail also to remember that if we are going to use equipment but little lighter and but little less speedy than that on railroads we must introduce railroad methods.

Unfortunately, operators can make switches and frogs in their own shops and the argument that they can be made in the spare time of men normally engaged in other work favors that practice, but it is questionable whether it is well and safe to rely on such labor for work so important. After all "quantity production lessens costs" and experience in trackwork such as manufacturers have acquired and experiments such as they have made do much to improve the quality of their work. The use of large and adequate forging, cutting and machining equipment and the division of labor practicable in a large shop reduce the labor cost and make the product better. Then again, the equipment is not only better constructed but made of more durable material. So, after all, the manufacturer usually has the better of the argument.

The saving on a home-made switch may be purely illusory, for a single wreck may wipe out the saving on several switches and the force in the blacksmith shop would be reduced if cars were not derailed. It is true that when the men who repair cars are not busy they can manufacture track, but how much better it would be not to have to repair cars so often! If this repair work were reduced it would be possible to reduce the shop force, and no time would be lost. What time is saved by making poor switches is lost by repairing the wrecks which these switches cause.

The Human Element in Car Rating

UNIVERSAL and uniform car-rating rules for coal mines are doomed. After some five years of experience under "C S 31," the rules set by the U. S. Railroad Administration in 1918 applicable to all roads and all bituminous coal mines, the decision has practically been reached to revert to the old practice of rules for each road. Hearings lasting for several weeks were held before the Interstate Commerce Commission late last year in an effort to revise the rules, for C S 31 had been found unsatisfactory both to the railroad and the coal operators. Based on the theory of distributing the available cars during a shortage among the mines in such wise as to give all equal running time, these rules operated to increase the ratings during times of shortage and decrease them during times of surplus. The inflation has been and is increasing, having reached a point where, according to the ratings, the mines have capacity to produce more than 20,000,000 tons per week, an absurd figure.

Under the leadership of the National Coal Association, the operators undertook to revise these war-time rules and yet to preserve their uniformity. After the hearings before the commission were concluded and the matter was referred to the parties at interest for adjustment, the operators abandoned that position and agreed with the railroads in asking the commission for permission to work out rules locally, having set up certain general principles. These principles are found in the rules now in effect, and interject nothing new.

It is clear enough that what is wrong with C S 31 is that there is no policing of its application. The rating for a mine is based solely on the statement of the operator. The apparently simple facts on which he reports are not always easy of ascertainment and are most difficult to check. Wholesale inflation of ratings has resulted. After struggling for months in an effort to devise rules that would work, the effort is abandoned and the industry is about to revert to the old system of letting the railroads rate the mines and check their results.

Putting the matter in another way, it has been found, after some five years' experience, that it is not possible to rate coal mines by rule and formula. It is essential to introduce the human element of judgment, and since the coal operator is the most interested person in his own rating, he is the least competent to rate his mine. The railroad inspector has no interest as between mines save to see that all are treated fairly and uniformly.

Safer and More Economical Methods in Mine Haulage

One-third of All Haulage Fatalities Caused by Wrecks—Use Clamps Not Bolts, to Hold Guard Rails in Place—When to Retrack Development Haulageways—Mistakes in Turnouts That Cause Accidents

By Alphonse F. Brosky*
Pittsburgh, Pa.

SOME years ago an engineer made a computation of the number of cars derailed in the mine at which he was located, and after he had divided that figure by the number of locomotive trips in main or gathering movements—whether made with loads or empties or merely running light—he found that about one car was derailed for every trip made.

He reported this fact to the main executives of the company, adding that if means were taken to repair the then badly laid track and to maintain it in condition after it had been repaired these derailments could be averted. The officials to whom he sent the report were both chagrined and indignant that such a "cub" should have the audacity to tell them how they ought to manage the mine. Both mine superintendents and foreman were as one in scorning the suggestions offered.

Here was an opportunity offered a company to lessen the risk of haulage to which its employees were exposed and at the same time lower its haulage costs by fewer delays all along the line, and yet the officials were so shortsighted that they saw no economy in the proposed change. Fortunately the mine officials today have been "sold" on the idea of better trackage and haulage methods.

Progress Being Made in Improving Roads

Had C. A. Allen stepped into the past to make an investigation similar to the one he is now undertaking for the U. S. Coal Commission on wastes in the coal industry, he would have discovered that several per cent of the total costs of producing coal could have been shaved off had the companies realized as they do today the advantages of well-kept haulageways and correctly functioning rolling stock. More and more are mining men realizing that ways are open in which to better their underground transportation, and thus obtain a better all-around efficiency through a better balanced schedule in the several operations involved in coal production.

A number of factors enter into the problem of successful mining. If an experienced operator were asked what is the order in importance of the two main phases that influence the extraction cost, he would place the system of mining as the most essential and haulage next. A good haulage system is advantageous because: First, it eliminates much of the danger to which the underground workers are exposed on haulageways; second, it insures a continuity in transportation which makes for less idle time during the working day.

It might be well to repeat here a statistical statement which was part of Rush N. Hosler's presidential address before the Coal Mining Institute of America last December, even though it already has appeared in these pages. He said in part that in Pennsylvania bituminous mines "one employee in every 250 engaged in haulage is killed each year and that annually one brakeman and trip rider in every 120 engaged in that work likewise is killed." An analysis of his tables (see *Coal Age* of Dec. 21, 1922, page 997) giving the causes of the fatalities from accidents in the haulage of bituminous coal discloses that 28 per cent of these accidents occurring during the last five years on the outside of the mine and 41 per cent on the inside are due to wrecks.

In most cases these wrecks are not the direct fault of the employees. Faulty rolling stock and trackage usually are responsible. More attention to clearances, more effort to keep the haulage roads clean, more provisions to prevent derailed cars from displacing timber, the employment of trap doors that operate automatically and a due regard for discipline ultimately will reduce these percentages to a normal level. Safety is almost assured where correct haulage methods are practiced, and surely the cost of safety cannot be figured in dollars, because life is priceless. The operator owes his employees a maximum degree of safety and to himself what savings he might effect thereby.

But the economy is as inevitable as safety. For this

FIG. 1—OUTSIDE TRAMWAY LAID WITH 56-LB. STEEL

There is no reason why the surface, or outside, tramway should not be better constructed and maintained than the underground haulage road. Natural conditions favor such a roadway. With a good track the motorman can speed up his trip, clipping perhaps a few minutes off his running time. The side track leads to the slate dump. Even that is substantially built.

*Assistant editor, *Coal Age*, Pittsburgh, Pa.

reason the savings due to improvements in haulage methods and equipment can be figured in dollars and cents. Proper haulage methods will eliminate many delays and enable the operator to obtain a steady run throughout the day. This will enable him to increase his production.

Where attention is paid to keeping the equipment in good condition the repair cost will be distributed over a longer period and not be "bunched" as it is when equipment causes a wreck and brings many cars and locomotives to the shop at one time, tears up track and pulls down timbers, roof and wiring. Proper attention to the safe practices in haulage will afford steadier work to all persons employed, and this will result in greater efficiency.

Underground transportation can be bettered in two directions—one, attention to the roadbed and the other a study of the more technical features of the problem, such as may perhaps be dignified as engineering. In

FIG. 3—WELL DITCHED AND DULY CLEANED ROADWAY IN A KENTUCKY MINE

The ditch is on the "tight," or untraveled, side of the road. It not only removes what water might accumulate but assists the crew when the track is to be aligned, for only one side of the roadway need be dug up. A well-drained roadway does not have to be retied frequently. Note the well-trimmed ribs and the arch roof adjoining the overcast.

this article will be considered the simpler—those which may be termed the common-sense—features of the problem.

What are the causes of wrecks on inside haulage roads and outside tramways at bituminous mines? They are many and varied in character. In an effort to arrive at some conclusions regarding this all-important question and in a search for remedies, I have consulted with mining men of four states, consequently the reader need not hesitate to accept the suggestions made for fear that they are merely the ideas of any one person. The suggestions represent the opinions of many men whose assistance was sought.

For safe and economic haulage the track should be well supported and straight to a fault except where curves are necessary to meet changes in direction. Such curves as cannot be avoided should be of long radius. On the main haulages the curves will be so gradual that the motorman will feel assured of safety and so will not cut off any of his power and the only reduction in speed will be that which is the result of the increased friction between wheels and rails and between axles and bearings such as is inevitable when traveling around curves.

If he is not compelled to "feel" his way around a curve then assuredly that curve is properly designed and constructed. The rails should be so well matched that the joints have neither vertical nor horizontal offsets of any magnitude. Then the locomotive and cars will travel quietly except for the inevitable noise of moving parts and rubbing surfaces. The cars will not sway from side to side as the wheel hits irregularly lined joints, nor will the wheels be mounting or dropping at stepped joints. To insure this regularity of track, the rails must be tied together by fishplates firmly bolted and be mounted on ties spaced close enough and ballasted well enough to carry the loads to which they are subjected.

Judgment and not a rule of thumb should be used in selecting the kind and size of ties and in deciding upon their spacing. Sometimes when the spacing seems to be correct the support may be insufficient, due to the condition of the timber. Ties to all appearances sound may be rotted on the bottom, in which case the track is likely to spread or break down at an inopportune moment, failing without warning and causing a serious wreck. There is ample proof, from those who already have thoroughly tried out the plan, that wherever track is to be kept in permanent use, treatment of the ties with wood preservative is both an economy and a safeguard. And here let it be said that only the best ties obtainable should be used. Culls have no place where strong track is desired.

Plate Saves Tie from the Tearing of Spikes

Heavy rail usually is laid underground wherever hauls are long, necessitating heavy and fast trips. The rails should rest on tie plates, especially where the ties have been treated previously with a wood preservative and so are likely to have a life long enough to make it profitable to preserve the timber from the tearing action of the spikes. Large haulage locomotives, weighing from 24 to 30 tons, require not only sufficient support but all that is needed multiplied by a liberal factor of safety.

For all practical purposes rails less in weight than 56 lb. should rest on 5x7 in. ties, and standard railroad ties 7x9 in. should be used where the rails are heavier, especially at curves and cross-overs. No fixed rule has been adopted for the spacing of ties on underground roads. Too often they are set too far apart, with resultant track trouble due to insufficient support.

The track often gets out of line simply because the ties are too few to keep a sufficient grip on the roadbed and spreading is likely to occur if by reason of the sparsity of ties a sufficient number of spikes cannot be driven to hold the rails to gage. It is better always to err in the direction of placing ties too close to each other than to attempt to economize by putting them too far apart. If the track sags the fault should not be placed without investigation on the character of the bottom. It may indicate only that the ties are too few.

If the tracklayers are careless and do not leave enough clearance at the joints before plating and spiking, the rail is likely to buckle. If old track sags and gets out of alignment it may be realigned, the joints may be made tight and ties retamped and conditions may be greatly improved thereby and this without interfering with current operations; but if it buckles, no matter to what extent, there is but one positive remedy and that is to tear up the entire length affected, to jack the crooked rails until they are straight, to shift the ties back into line and to re-lay the track. In many

cases it is an economy in repair cost and a saving in operating time to lay new track and take the old steel to the outside, where it may be straightened and stored for use elsewhere.

The Elkhorn division of the Consolidation Coal Co. maintains a uniform joint clearance of ½ in. in all its mines. A gage of poplar ½ in. thick is furnished all tracklayers for this purpose.

Rails heavy enough to sustain almost rigidly the loads which travel over them should be provided. The growing tendency in mines is toward heavier rail on main haulageways. With the introduction of the electric mine locomotive 40-lb. rail was laid on all major haulage roads so that today only rarely a mine with a production of 1,000 or more tons daily is equipped with lighter rail than this.

In its No. 3 mine the Ford Collieries Co., of Curtisville, Pa., has laid 56-lb. rail on its main haulageways and lays all its curves on radii of 150 to 200 ft., and finds that it pays. In its other mines, until such time as it can make this practice standard, the roads, though provided with curves as easy as those specified for heavy rail, are laid with 56-lb. rail, well braced to the ribs, duly elevated, and laid on 7x9-in. ties.

Heavy Rail for Mine Track Is a Real Economy

This company has found the heavier rail such a profitable investment that all future main-line track will be laid in this manner. Experience has demonstrated clearly to the Ford Collieries Co., that heavy track is really an economy. Rails of 40-lb. weight are apt to spread, especially at curves, whereas 56-lb. rail gives admirable results. This company is only one of many that advocates rails heavier than 40-lb. The jump will be from the rail of 40-lb. weight to that of 56-lb. In fact, not a few companies have been using 70-lb. rails for some time wherever long hauls from the face to the shaft bottom or to daylight necessitates the maximum haulage speed allowed by the law. With the rapid advances in underground transportation, may we not believe that at some future date all the mines with large acreages will be laid with 70-lb. track, and the whole system laid out so as to approach that on our present railroad systems?

Drains as Important in Mine as on Surface

To maintain good track after it is once laid, the entries, wherever water is likely to gather during the wet seasons, must be provided with drainage ditches. In many mines where the roadbed softens and expands when wetted, the management need look no further than this for a cure of its haulage ills. Ordinarily, in a well-drained roadway the waste material of which the road bed is made tamps to a compact mass that gives but little under a passing trip of loads. But when wetted this same material loosens up and heaves, distorting the track and failing to support it properly.

Track shifting can be averted, oftentimes, merely by bracing the rail from the ribs. The number of braces in a unit of distance depends upon the tendency of the track to shift. Two braces to one rail length, staggered to either side, usually is sufficient. One company, on main haulage roads, staggers these braces so that they are placed on 29-ft. centers. However, on curves these braces should be inserted every 8 or 10 ft. It is a wise practice to brace every curve over which locomotives and trips are likely to pass. In any case the braces and ties should not be permitted to project above the level of the roadbed or above the walkway on the clearance side.

Near frogs, guard rails should be used just as frequently in the mine as in standard railroad work. Only too often protection of this sort is looked upon as a needless expense, but this viewpoint is wrong, for the use of guard rails is justified not only by the protection that they give to the traffic passing over the frog but also by the lengthening of the life of the frog itself. If guard rails are used they should be held in position by a suitable guard-rail clamp rather than inefficiently by two bolts, which soon bend back and render the guard rail practically useless.

A company manufacturing track equipment says that the excessive wearing of frog points is the burden of most of the complaints received. Sooner or later any frog point that has become blunted in use is sure to cause a derailment. This company adds that investigation discloses the fact that when complaints as to the premature wearing of frogs arise the frog has not been kept at proper gage, has not been set in accurate alignment or has been subjected to improper wear owing to the fact that the rails adjoining it were not properly supported so as to remain in the same horizontal plane.

FIG. 3—A SORRY BIT OF TRACKWORK

This illustration was taken at a mine capable of loading out a large tonnage. The frog is a No. 3 and the gage 44 in. Fig. 5 shows in greater detail how the frog is joined to the track. A little care would have prevented all these many fatal errors. Too often is "fatal" the right word, but the trackmen do not realize that fact.

One superintendent set his gage at the frog one-half inch tighter than his standard because "he understood that there was an inch difference between the wheel and track gages." Needless to say, his frog points were badly worn in a short time. After being instructed as to the correct way in which to place his frogs he experienced no further difficulty.

The most serious of all wrecks occur on curves where the proper elevation of the rail is not provided. The height to which the outer rail should be elevated is regulated solely by the speed; therefore main-haulage curves must be elevated with regard to that factor. Where the trips pass over the curved rails at ordinary speeds, the rails are not elevated. Indeed, it would be foolish to carry refinements to that nicety.

Frequently on rope hauls neither rail is elevated, and sometimes, though rarely, the wrong or outer track is the one made the higher of the two. A locomotive trip has a component acting away from the center of the curve. This is a centrifugal force which must be counteracted by elevating the outer rail. On the other hand, in rope haulage the rope pulls the cars toward the center of the curve with a force exceeding that tend-

ing to cause them to fly outward, so they are subject to a centripetal force which must be offset by the elevation of the inner rail.

Switches and frogs to a room neck, even though that room will one day become a haulage road, should be torn up as soon as the room is finished, unless indeed only a short period will intervene between the completion of the room and its use as a haulage road. Some are of the opinion that if that period is a year or more, the frog and switch should be torn up, even though they will have to be reinstated at a later date. Others say that if the idle period is only six months the lifting of the frog and switch is justified. If it is of no use during the intervening time why not tear it up immediately? The chances are that it might be advisable in any event to lay a better track at this point later. Frogs and switches are destructive to rolling stock and the fewer there are the better.

Why Run Railroad on Contractors' Track?

When an entry becomes a main haulageway in the true sense of the word, the rails used in development should be lifted and replaced by well-aligned track. A butt entry usually is regarded as being of that character as soon as the first rooms are driven off it. The development track in a main entry is replaced by permanent, well-aligned track whenever other development has advanced to such an extent that the coal being mined is more than can be handled safely on the temporary track of the entry. It is best, working nights and Sundays, to commence retracking the main entries before the rooms are turned, working progressively, of course, toward the advance workings. The permanent track may not really be needed so soon. However, the work should not be started until sufficient advance has been made to permit of the establishment of grades that can be maintained for some distance. All these are factors that must be considered from the very start of an operation, if safe haulage in the future is desired.

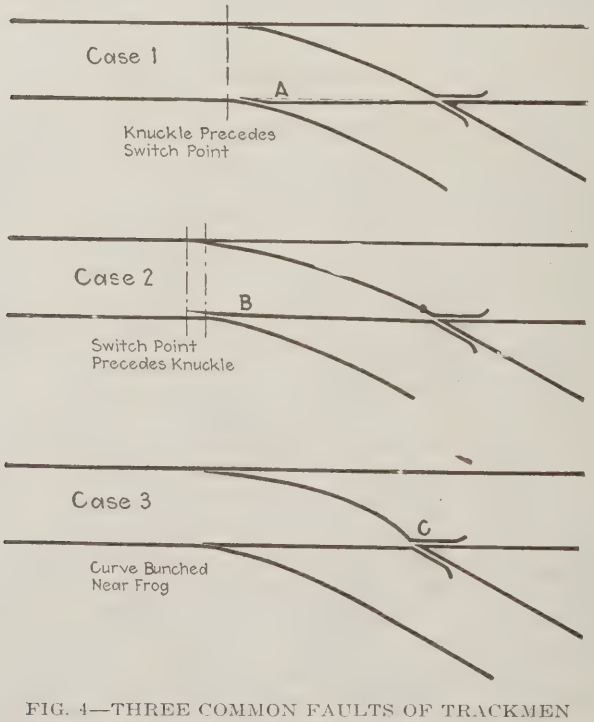

FIG. 4—THREE COMMON FAULTS OF TRACKMEN

The errors in this track have been exaggerated, for a drawing disguises rather than reveals bad switch work when drawn truly and to scale. At *A* the gage of the track is exceeded, at *B* it is tight and at *C* not only is it wide but the turn is also sharp.

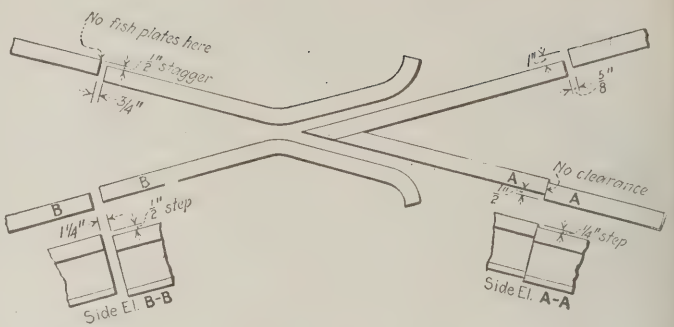

FIG. 5—DIAGRAM OF TRACK WORK IN FIG. 3

Whenever an 8-ton motor passed over this frog it had to climb the stepped joint and the impact was considerable. Similarly the side thrust was severe when the motor took the offsetted joint. The frog base also was not properly supported, nor could it be with both vertical and horizontal offsets. The many tons and the many men passing over this frog would justify an effort to have it truly aligned in every plane.

Switches improperly laid and maintained are the cause of many derailments. Tracklayers sometimes let the knuckle of the rail sit either too close to or too far from the switch point. These mistakes are illustrated in Fig. 4. In Case 1 a motor or wagon traveling on the straight road will hit a point of wide track gage at *A* in passing over the turnout. In Case 2 the track gage is tight and, further, the tracks are so laid that the locomotive or a mine car may split the switch.

Track Gage May Be Faulty Even at Switch

Another mistake frequently is made in laying turnouts. This is the "bunching" of the curve of the turnout near the frog. This, apparently, is the result of not curving the rail before spiking. The mistake usually is discovered but instead of taking up and rectifying the rail, the tracklayer gives more curvature at the end, while one end of the rail is still held down by the spikes. This is illustrated in Case 3 of Fig. 4. The irregular curvature would not be objectionable were the turnout rail installed with a similar curve, but in the case of a circular curve with one end "hooked" as described, the wheels of the mine car or locomotive in passing over the 'hook" change direction too abruptly and rides roughly over the frog, which is soon thrust out of line. Sooner or later such an excessively short turn will lift the rolling stock from the track.

Government Operations at Eska, Alaska

WHEN the Alaska Engineering Commission closed its Eska mine it was not expected that the plant would be started for some time and perhaps not at all. Soon after that a cut in the U. S. Navy appropriation closed Chickaloon and its washery. The commission then decided to purchase its fuel on specifications and moved the laboratory from the cleaning plant to Anchorage and was just getting it ready for analytical work when the Evan Jones mine, adjoining the commission's property, caught fire. The commission's engineers fought the conflagration for a while and then, fuel running short, on Nov. 23 reopened the old Eska mine. The tonnage is picking up. It is now 125 to 150 tons per day. When the spring comes the output may well have been doubled. It will then be time to start the washer so as to have a good store of clean coal for the winter following. Chickaloon is in the region of the Matanuska River, which stream flows into Cook Inlet just where the great Alaska Peninsula roots into the body of Alaska much as a tusk enters the head of an elephant.

Four Ways of Lowering Electric Cables in Shafts*

Cables May Be Installed by Winches Above or Below, by Lashing to Cable and Lowering from Above, by Mounting the Spool Above the Cage and Slowly Lowering the Latter—Dangers and Their Prevention

A SHAFT cable usually is exposed both to mechanical damage and to the corrosive action of the water that falls down the shaft. To protect the cable against falling materials it should be provided with a double armoring. But this, while protecting the cable against falls, is itself subject to corrosion and so needs protection; therefore it should be wound with a double covering of jute, which in turn should be periodically treated throughout the entire length of the cable with pine tar or an equivalent, in order that the jute may be preserved. This should be done every two or perhaps three years, depending upon local conditions.

When a cable is fixed to a shaft wall ample space must be allowed at all points between walls and cable, in order to prevent the latter from being crushed against the wall by falling objects. It should be so attached as to allow it a moderate degree of resilience. Under these conditions it is less likely to be injured by falling bodies.

Shields Keep Out Dirt and Falling Objects

Moreover, the cable cleats should be provided with shields at the top to prevent dirt from accumulating around the cable where it enters the cleats. This shield also serves to deflect falling material by which the cleats might otherwise be injured. Every care should be exercised to prevent the jute from being damaged while being lowered into its place, as may happen if it is allowed to rub against walls or girders . Furthermore in lowering the cable or when placing it by any other method any temporary fastenings to the cable must be made with discretion.

Method 1—Lowering Cable from the Drum of a Steam Capstan or Winch.—This is perhaps the ideal method of getting a cable down a shaft, whether from the point of view of labor or of that of time. With this method the cable end is made fast to the cap of the rope of the winch or capstan and coiled on the drum, after which the end of the cable is fed over a suitable pulley into the shaft. By some other mechanism men are lowered down the shaft in a box at the same speed as that of the cable, which they are thus able to prevent from becoming caught in obstructions. One important consideration, however, must never be overlooked, namely: Is the cable to be lowered so long and heavy that suspending it in the shaft even temporarily from a single point of support will be injurious to it?

Obviously this will depend on the size of the cable and its construction. Thus a cable covered with lead and armored is much heavier than one that is insulated solely by a bituminious covering. To be on the safe side in this respect, it always is advisable to ascertain from the makers whether the cable is of a strength that can be lowered safely in the manner suggested, detailed information being furnished as to the exact method to be pursued. If the cable cannot be lowered in one length, the lower length or lengths must be suspended during the process of lowering, the whole weight hanging and depending meantime on a suitable clamp or socket, to which the winder or capstan rope is attached.

If possible the lower end of the socket should be tapered so that it will be less likely to catch on such obstacles as it may happen to encounter in its passage through the shaft. Having securely fastened a suitable socket to the end of the cable, the capstan rope, assuming that one is used for the purpose, should be attached and the cable carefully coiled on the drum over a bed of sacking or other material, such as will protect the cable from the hard surface of the capstan rope already coiled on the drum and will provide a more or less uniform surface on which to coil the cable.

A suitable pulley must be erected at the top of the shaft, which must be so arranged that a line dropped from the groove overhanging the pit shaft will fall where the cable is to be fixed, but clear of shaft equipment, for by rubbing against such obstructions the cable might damage its jute covering. The groove of the pulley should be large enough for the cable to lie in the base of the groove without being exposed to a crushing side pressure when the weight comes upon it. A layer of soft hemp fastened in the groove will serve as an additional protection. The clamps by which the cable will be permanently supported in the shaft should all be opened before any attempt is made to lower the cable, which should not be allowed to hang from its point of support any longer than is absolutely necessary.

Men Lowered to Keep Cable in Course

Men should be lowered at the same time as the cable to guide the end past any obstacle in its path and also to keep it in the course intended. When a cable has to be lowered in two or more lengths, it is necessary that the lower ones be let down with great caution, especially after the end of the cable which is fastened to the winding or capstan rope enters the shaft.

No matter how ingenious the design of clamp employed for holding the cable may be, it always is possible that it will catch. If this should occur, the descending rope, not being stretched by the weight of the cable, will begin to double on itself. Should the cable then loosen itself in some way, it would fall several feet and a serious accident might occur. Such a sudden load would be sufficient in many cases to strain the cable severely, if not to cause it to break loose.

Such an accident can be avoided if, after it has been ascertained how far the cable can be lowered safely, unattended without going out of its course or meeting with obstructions, the men are raised until they are level with the upper end of the cable and in a position to guide the cap where necessary. After lowering the cable the prearranged distance these men should again be lowered to the end of the cable and preparations made for a further lowering as soon as they have been brought again to the upper end. These operations must be continued until the cable is finally in the desired position.

It always is advisable to have the cable fastened into most of the clamps before the capstan rope is slackened.

*From *Electrical World*.

as by this means the weight will be more or less evenly distributed over the whole length of the cable, which toward its upper end naturally is under a greater stress than are the lower portions. Although in most cases this is not a serious matter, yet in some instances, owing to special circumstances, it may be desirable to relieve the cable of all strain.

To effect this a few of the lower clamps should be fastened and then made to take their share of the weight by lowering the cable a trifle, in order that the weight then hanging will be that of the cable less the lower portion already fastened. This might be repeated two or three times in sections up through the shaft, thus relieving the cable from all strain.

Method 2—Raising Cable from the Shaft Bottom.—This is a convenient method, provided that the cable drum can be taken to the bottom of the shaft. Once there it is placed on a strong bar resting between two substantial supports, so that the drum can rotate. A capstan rope is then lowered and connected by a suitable fastening to the cable end, which is pulled up the shaft and watched by shaft men, who should accompany the ascending cable on top of the cage in order to prevent obstacles from catching it.

Method 3—Lashing Cable to Capstan Rope.—This is method usually advocated by cable manufacturers, because if properly done, it is a fairly safe plan and the cable can be placed without any fear that it will be strained by its own weight. However, much more skill is required, and incidentally much greater patience, and mishaps are more likely to occur than in some other methods of installing.

Cable and Rope Fed Into Shaft at Same Time

In this method a capstan rope is needed as before, but instead of fastening the end of the cable to the rope and suspending it by its end, both cable and rope are fed into the shaft at the same time. The cable is lashed to the capstan rope every few yards, and these attachments serve to support the cable. As just mentioned, much skill is required to make the fastenings between the cable and the rope satisfactory. Unless they are proof against slipping on the rope the cable may pull its spool and everything else with it down into the shaft.

The chief objection to this method is the possibility of the numerous lashings becoming caught here and there in the shaft and thus caused to slide up both cable and rope until long lengths of cable remain unsupported. Furthermore, should the lashings so slide, it will not be without resistance. The jute, in consequence, will become torn and perhaps stripped loose for long distances, thus exposing the cable to the effects of the shaft water. Moreover, one of the objections to this method is the great length of time required to put a cable down a shaft by this method. It would not be wide of the mark to say that from the commencement of operations Methods 1 and 2 can be carried out in less than half the time required for the method that has just been described.

Method 4—Cable Drum Slung on Cage.—The foregoing methods of installing shaft cables obviously are applicable to almost any kind of shaft. A method may be given, however, which can be used where it is not convenient to use a capstan and where rope guides are used.* This method is both effective and rapid. The cable drum is erected between the bridles of the cage. As the cage is gently lowered, the drum, being slowly revolved, is paid off into the clamps in the shaft. Where this is done it usually is necessary to use for the purpose extra long bridles or cage chains so as to leave room in which to erect the drum in the angle between the rope cap and the cage.

To these various considerations it should be added that where a cable is too long to be put down in one length it is necessary to make joints, which should, if possible, be at a heading rather than on the shaft wall, for thereby the joints can be made and permanently kept in a dry place and furthermore the joint can then always be kept where it will be protected from falling material and where overheating or other troubles more readily can be corrected. However, where no heading is available the cable must be joined on the shaft wall, or in some more suitable position if that can be found. In such a case, a vertical type of junction box might be used, but joints of any kind are most objectionable in shafts and should be avoided if possible. At all points below the surface where cables enter or leave the shaft provision should be made to protect them from falling material which might cause injury. Suitable stout wooden coverings should be fixed on the shaft wall and project beyond and surround the cables, which should pass through the covering before bending to enter the heading or other opening.

Shaft cables should be examined by the electrician at least every six months and more frequently where circumstances make frequent inspections desirable. This inspection should be made from the top of the cage by the aid of a good light in order that defects may be easily noticed. The breaking of the jute covering and the accumulation of dirt around cables where they enter clamps are the chief sources of trouble which require attention, but more serious damage always should be anticipated and its presence sought.

*This cannot well be used in American coal mines, where rope guides are seldom if ever used.

Can Peat Be Used to Bind Coal Briquets?

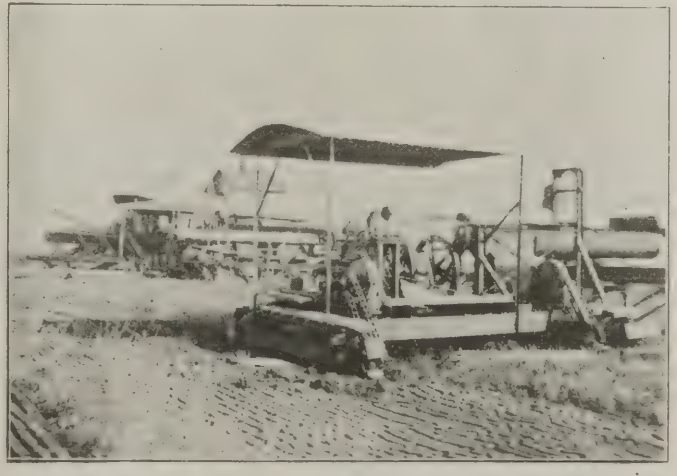
THE readiness with which peat will coke without any binder suggests that it might be used with a coal lacking in agglutinant to give the necessary binding quality. It would be essential that the peat be obtained from bogs readily available to the mine or the market, for it probably would not pay to transport the peat any distance. The Peat Products Corporation has set up a press at its bog at Eaton Rapids, Mich., and at the present time is producing peat briquets for sale. These it is selling in the neighborhood of Grand Rapids, Mich.

The process is exceedingly simple, consisting of passing air-dried peat containing 35 per cent of moisture directly into a Universal press. A. L. Stilllman, in his book on "Briquetting," says: "It is probable that a change in the structure of the peat is caused by the successive linear pressures produced by this press and that the water is thrown from its colloidal condition in somewhat the manner claimed for the Ekenberg process. At all events the peat, which has reached its limit of air drying at 35 per cent, goes after it is in the briquet form, through a secondary drying which is accompanied by setting and hardening. The result is a fuel that is not degraded in shoveling and is as convenient to handle as coal. By reason of its briquetted form and the nature of its combustion it has a heat-radiating power which, for stove or hearth at least, gives the briquet a value far beyond what its B.t.u. content would indicate."

Canada Hopes Peat Will Displace Much Anthracite

Dominion Has Mapped 190,000,000 Tons of Peat Fuel—One Machine Will Produce 100 Tons per Day—Peat Costs $5 per Ton at Plant—Gives Two-Thirds as Much Heat as Anthracite

By E. L. Chicanot
Montreal, Que.



Until the winter of 1921 few Canadians and still fewer residents of other sections of the North American continent were aware that Canada had any peat resources, and if they did know in a vague way of the existence of peat bogs they did not realize that these had any commercial value or that any steps were being taken to exploit them. It was only when the coal shortage hit the country and dealers and consumers were sent scouring in all directions for fuel or a substitute for fuel that it was discovered that due to government foresight, experimentation and development, a supply of peat fuel, limited it is true, but valuable nevertheless, was available.

Though not enough to have any appreciable effect upon the general fuel situation it partly solved the problem for some few consumers. It disclosed the information that, if properly and adequately developed, Canada's peat resources were sufficient to cut out one-fifth of the anthracite imports on which Canada is dependent each year.

The Government of Canada has, however, always foreseen the possibility of such a stoppage in the fuel received from the regular sources in Canada and the United States. Canadian legislators have been always painfully aware that eastern Canada is dependent upon the United States for its fuel supply and that one of the most pressing of national problems was the discovery of a solution of this situation. One of the means taken toward the ultimate removal of the difficulty has been to conduct experiments of a commercial size upon the peat bogs of the Dominion in order to discover whether these peat resources could be turned to economic account and become a rival of anthracite.

The great interior of Canada has been created without supplies of suitable coal but Nature apparently made some provisions nevertheless, for this expansive area abounds in peat bogs that will be permanently available as sources of fuel as soon as the necessary developments are made. These bogs are well distributed throughout the middle provinces and cover in all some 37,000 square miles In many of these areas the peat is particularly well suited for manufacture into fuel for domestic and power purposes, the bogs being conveniently situated as regards transportation facilities and lying not far from industrial communities.

In the Province of Ontario alone there are thirteen bogs estimated to contain 43,000,000 tons of peat and capable of producing 1,800,000 tons of ammonium sulphate and gas power sufficient to generate 40,000 hp. continuously for 100 years. A government board dis-

SPREADER AND EXCAVATOR AT WORK IN PEAT BOG

The spreader is in the foreground. The spreader lays the peat down in a thin layer and with revolving disks cuts the mass into long narrow rows so that the sun can dry it. The water in peat is in the form of a jel: it cannot be squeezed out any more than the water in a jelly.

Note—The headpiece illustrates the Alfred peat bog in Prescott County, eastern Ontario, near the Ottawa River, which forms the Quebec border. The equipment includes the excavator, the conveyor, grinder and spreader. Note the large area over which the peat is spread for drying.

REAR VIEW OF SPREADER WITH CATERPILLAR TRACTOR

The spreader receives the excavated peat from the rear, the product being brought by the conveyor shown in the headpiece and in the illustration of the roller cutter.

covered eighteen bogs in Manitoba and its report stated that the Winnipeg River district contained 1,860,000 tons of peat fuel, if dried so as to contain 25 per cent of moisture. Less than one hundred miles from Montreal there are seven bogs the resources of which run into the billions of tons.

Efforts to utilize Canada's peat bogs commenced more than half a century ago and were continued in the period up to the end of the war in a spasmodic and desultory manner. In the main they were not satisfactory, and the average pre-war output in the entire country was only about 2,600 tons. An investigation by the Dominion Mines Branch determined that this failure was due to the fact that the producers of the commodity did not know how it should be handled and had not availed themselves of the experience and practice of European producers. If the commercial exploitation of Canada's peat deposits had depended upon private companies or individuals there is little doubt that Canada would today be but little nearer alleviating her fuel needs with supplies of peat than she was when the Mines Branch first approached the problem.

Canada's fuel problem was practically the first to occupy the attention of the Bureau of Scientific and Industrial Research when it was formed, and though one method of solution attempted was the utilization of the lignite deposits of southern Saskatchewan by briquetting, thus providing for the Middle West, the other method was the development of Canadian peat bogs. In 1918 the whole question was placed in the hands of a Peat Committee, consisting of four members, who conducted investigations into the peat bogs of the entire Dominion with a view to establishing their utility as a source of fuel.

ROLLER CUTTER MAKES BRICKS FROM STRIPS OF PEAT

By pulling a roller cutter with the sharp edges set at the correct centers athwart the strips laid by the spreader the peat is cut into bricks of the correct size.

To date of the 37,000 square miles of peat in the Dominion 105 bogs have been surveyed with an aggregate area of approximately 224,131 acres. These contain 190,330,170 tons of fuel and 20,588,110 tons of litter. Forty-six of these bogs are in the Province of Ontario. They have a total area of 132,231 acres and contain about 110,109,000 short tons of peat fuel and 518,000 tons of peat litter. During the past year four bogs were surveyed in the province, a total of 11,089 acres being investigated. Three are situated near the cities of Fort William and Port Arthur and the fourth near Verona. All were found to contain peat suitable for fuel.

Both on account of the greater need of the industrial area about it and the favorable nature of the deposits, and the additional fact that the Ontario Government had preliminary investigations already under way in that area, attention was devoted by the Peat Committee to the bogs about Alfred, in Prescott County, Ontario, not far from Ottawa. Experimentation and development has been practically concentrated at that point. When the committee turned its attention to the possibilities of this bog much work had been done already with machinery of a rudimentary character. Peat was about to be shipped in 1914, when the outbreak of the war disorganized markets and traffic and set back development. The Peat Committee immediately and definitely adopted the process of air drying, feeling assured that it was the most efficient and practical way in which to rid the peat of moisture. This made the problem a purely mechanical one and the committee proceeded to attempt its solution as such.

Price for Years Has Been Real Difficulty

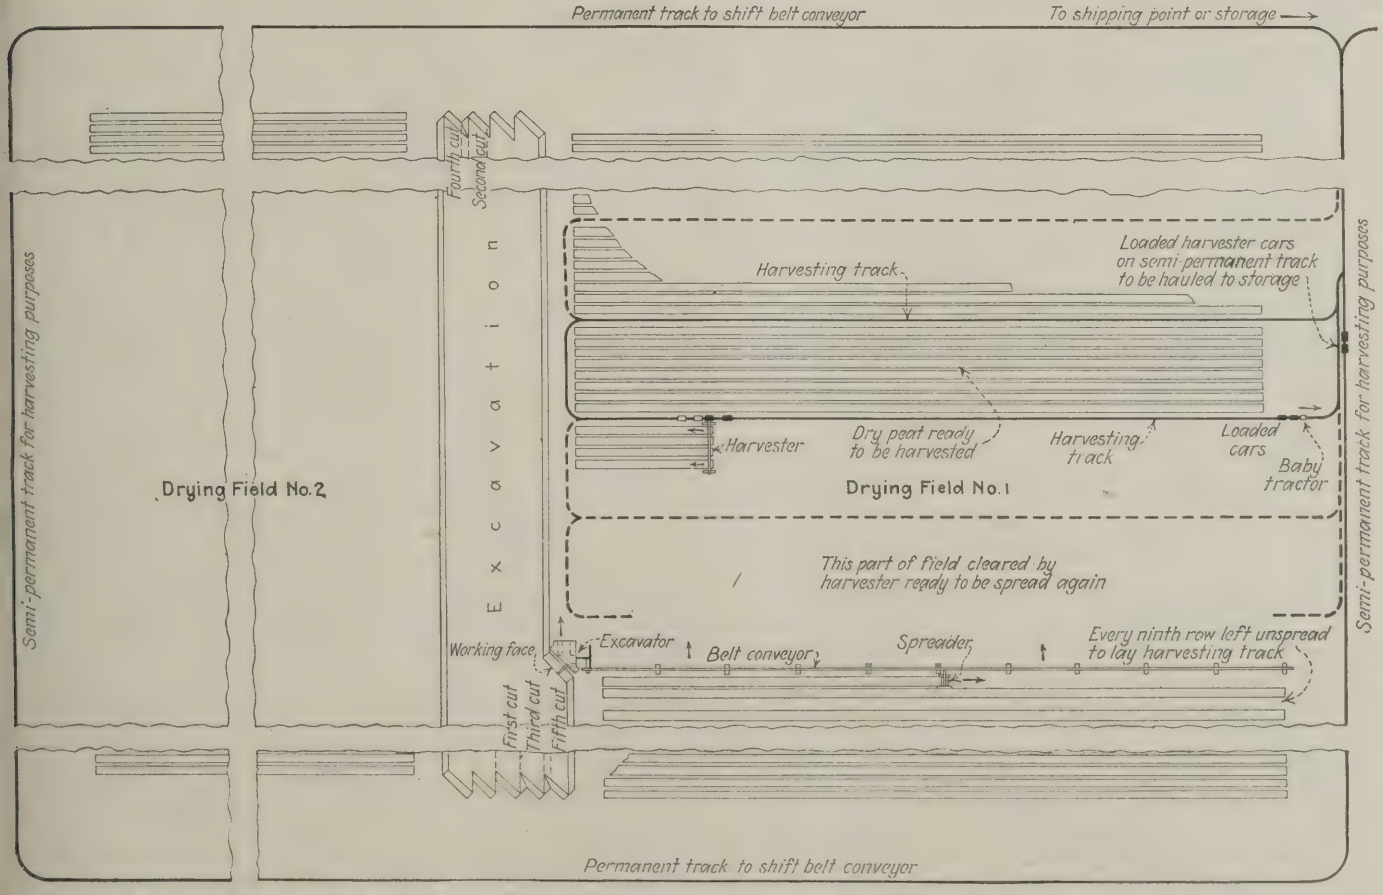
In surveying the work that has been accomplished by the committee on the Alfred peat bogs since that time it must be borne in mind that it has this problem to solve and that all efforts were of an experimental and investigatory nature. The fact that fuel could be manufactured from these bogs already had been established; the problem confronting the committee was to devise a system of manufacture that would permit the finished product to compete with imported hard coal. Working with the old plant already on the ground in 1919 3,000 tons of peat fuel was produced, and it found a ready market.

During 1919 a new machine had been designed to remedy faults found in the one preceding and the two operated in competition throughout the year 1920, producing 5,500 tons of manufactured peat. For the product a remarkable demand developed, inquiries coming from New Brunswick and Quebec points. The bulk of the product, however, was consumed in Ottawa and other points contiguous to the manufacture, though some went as far as Three Rivers, Que. A close study was kept upon the two machines throughout the year, with the result that the committee concluded that both could be improved, and accordingly a new machine was designed combining the best points of each of the other two.

The year 1921 was occupied largely in the construc-

tion and erection of the combination plant, so that the year was to a great extent one of continued experimentation and development along other lines than production. In order to keep up a certain proportion of the output one of the condemned plants was continued in operation throughout 1921 and a total of 3,889 tons of peat produced. Of this 1,500 tons was shipped to markets which had already been developed and which, in the previous year, could have absorbed ten times the production. An unfortunate fire of unknown origin consumed practically the entire remainder of the output and put an end to shipping for that year.

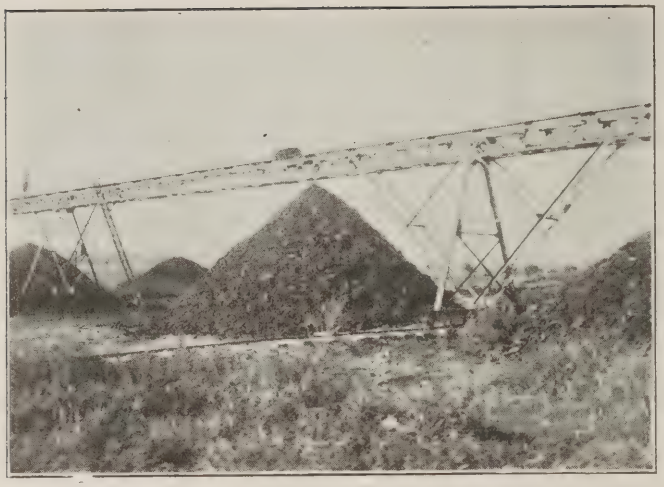
The work of the year, however, was of great value, for it demonstrated the value of the new plant, which fully met the expectations of the engineers who had designed it. The machine had a capacity of ten tons per hour and was expected to maintain an output of 100 tons per day of ten hours.



Another achievement of 1921 was the development of a small machine which can be operated by three men, the production of which will average about two tons per hour. The machine thus made and perfected was devised for use on small bogs where it may be used by farming communities to supply their local needs. It may be of value also in finishing up the irregular work on extensive deposits to which the larger machines could not readily adapt themselves. In developing this machine the engineers had Ireland in mind, which is the principal peat-producing country of the world. In that country the annual production runs into millions of tons, all of which is the result of work upon small areas.

In the early part of the year 1922 a new and improved grinder was installed in what was considered an already perfected plant. Delays incident to this curtailed the length of the actual working season. Furthermore, the power equipment of the plant was found insufficient to operate the new grinder at its full capacity, so that the year's production, in even the abbreviated period, does not represent the seasonal capacity of the plant or its possible output. Instead of the capacity output of 100 tons in ten hours an average of 73 tons was turned out over the entire period of operation, though, taking into account the loss of time in getting under way, the production was actually 89 tons per day of ten hours.

Peat Fuel Found Eminently Satisfactory



The total production of peat at the Alfred bog in 1922 was 5,000 tons. This was distributed over a wide area in eastern Canada, large consignments going to Montreal, Ottawa, Peterborough and Belleville and landed at these points at prices which made it easy to compete with coal. In every case the peat was sold to customers of 1920 and 1921 who had been eminently satisfied with previous consignments and had placed their demands for the 1922 crop early in the summer. Not a single complaint was received from any consumer of the peat prepared in 1922.

This peat was laid down at the track at Alfred, Ont.,

PLAN OF HARVESTING FIELDS SHOWING EXCAVATING TRENCH, EXCAVATOR, SPREADER AND HARVESTER

The excavator does not work on a face in the same direction as the excavation but on one inclined as shown, at an angle of 45 deg. The peat contains 88 per cent of water and 95½ per cent of that water is removed, for in 100 lb. of natural peat there will be 12 lb. of solid matter and 16 lb. of product where the water content is 25 per cent, or 4 lb. Thus 88 lb. of water has been reduced to 4 lb., or 84 lb. of water out of 88 lb. have been withdrawn, or about 95½ per cent. From a content of 733 per cent as compared with the solid matter in the peat it drops to 33 per cent. This result is obtained by spreading the peat over a large field in long rows of nine. Between each ninth row is laid a temporary harvesting track and on the edge of the field on either side a track that is permanent. The season for drying and therefore cutting peat is only 100 to 120 days long. On the other two sides of the field tracks are maintained for shifting the conveyor from one drying field to the other.

TRESTLE FOR PILING MANUFACTURED BRICKS OF PEAT

It is remarkable how strong these bricks are after drying for from two to four weeks on the ground. There is a cementing material in them which acts when the peat dries. It is not wholly dried, of course. About 25 per cent of water still remains.

at $5 per ton, the difference between this and the prices paid by consumers representing freight rates and dealers' profits. This price covers the entire cost of operation and all overhead—the running of the perfected plant which consists of a combined excavator, grinder, belt conveyor and spreader, the turning of the peat bricks, which is performed by hand, and the trucking to storage or loading for shipment. It is the conclusion of the engineers that at this price the product can be manufactured commercially with a reasonable profit and that the price might even be shaded a trifle if the power problem were adjusted. Indications are that the operation of the Alfred peat bog may be taken over by a private corporation in the present year.

Anthracite has only 1.5 times as much heating value as manufactured peat, the latter being largely free of ash, which in coal may amount to between 10 and 25 per cent. Peat has been mixed successfully with anthracite and this is fortunate for practical usage, for if all Canadian peat bogs were producing they would reduce anthracite importations barely one-fifth.

How a Change in Valves Greatly Lessened Feed-Pump Repairs at Nacmine, Alta.

By J. B. de Hart
Nacmine, Alta.

AT OUR mines at Nacmine, Alta., we have had much trouble with the brass valves in our feed pump, and the method by which we have overcome the difficulty may be of use to others who are experiencing the same trouble.

Fig. 1 shows the seat and valve for a duplex feed pump 7½x4x6½ in. The pump has eight such seats and valves, and they were continually giving trouble. They had to be taken out and faced up in the lathe on an average of once every three weeks, so that we had to keep a spare set always ready.

We redesigned the seats and valves and had them made as shown in Fig. 2. The valve disk and washer are held on by a ¾-in. nut with a ⅛-in. cotter pin through it to prevent its working loose. The nut is not shown in the drawing. The valve is then rubber to brass instead of brass to brass. We had two sets of valves made of the new design so that there would be no delay when they needed repairs.

The first set was put in more than one year ago and has never had to be taken out except for inspection. The disks have never been changed and appear good for another year and the second set has proved itself unnecessary. The quality or the quantity of water the pump has had to handle has not been changed and the valves are working under exactly the same conditions as before.

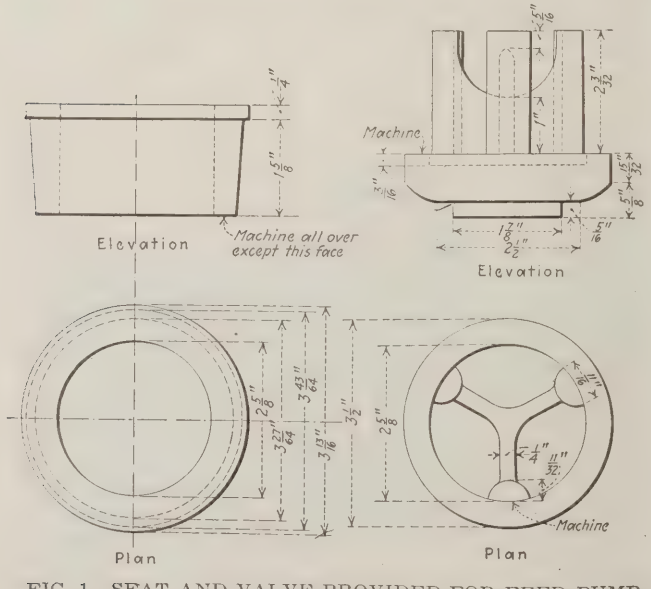


FIG. 1—SEAT AND VALVE PROVIDED FOR FEED PUMP

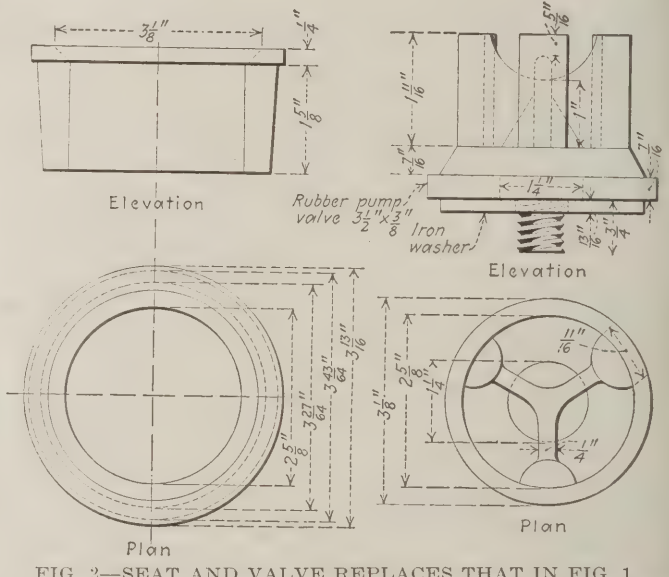
Valves and seats such as these had to be taken out and faced in a lathe once every three weeks. It will be noted that brass was in contact with brass and the result was not good.



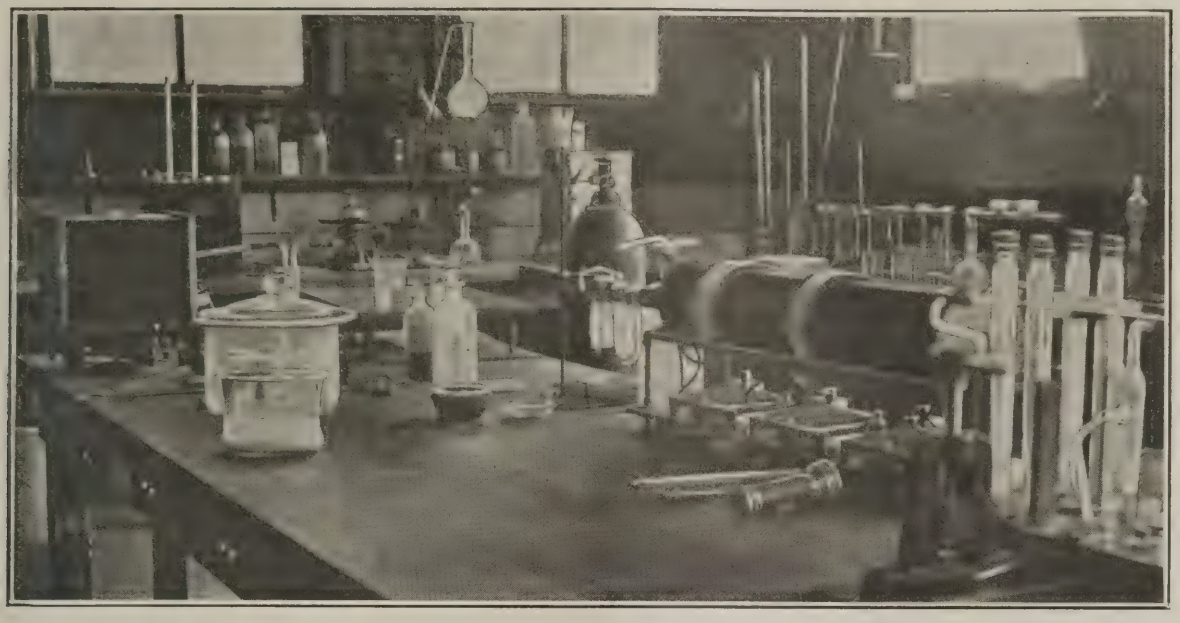


FIG. 2—SEAT AND VALVE REPLACES THAT IN FIG. 1

In this the valve is provided with a rubber disk that is held in place by a washer. The contact is between rubber and brass, and a tight connection is thus attained. After a whole year the seat and the valve are still giving good service and, what is more, have needed no repairs.

No doubt many other pumps have the design of valve shown in Fig. 1 and they probably are giving their owners the same trouble and expense that our's gave. I can assure anyone in this unfortunate predicament that new valves and seats made up as shown in Fig. 2 will entirely overcome the difficulty. This is one of the instances, not infrequent about the mines, where a little common sense and ingenuity applied to design will sometimes work wonders in the way of improved operation.

How Pennsylvania Coal & Coke Corporation Keeps Its Product in Compliance With Severe Specifications

Company Inspectors Visit Mines Unannounced—Mine-Car and Coal-Face Samples Taken and Analyzed Periodically—Records Make It Possible to Trace Back the Contents of Any Car to the Place Where Loaded

DURING the constricted market for coal in 1921 and in the pre-strike period of 1920 important advances were made in the preparation of coal. In the past one occasionally heard the trite remark that "Coal is coal," and some men were indifferent as to the quality of this fuel so long as the price was right. Consumers now are being educated to demand clean coal and no other kind will do. The shrewd buyer would no more think of buying coal without investigating its merit than he would consider buying a high priced animal without looking up its pedigree. He demands a certain grade, and he gets it.

With more mines opened up than are really needed in normal times, manned by too many miners, it is unlikely that the coal demand for any length of time in the present or next generation will ever again exceed the possible output. Keen competition must result—not in price alone but in quality also. For this reason a new era in coal mining and preparation is upon us. The change, though still in its infancy, is marked enough to be readily noticeable.

From now on the operator will have to study extraction from the viewpoint of quality as well as quantity. Hereafter coal will have to be sampled and analyzed and closer watch will have to be kept over preparation above and below ground. And not only that; there will be, hereafter, a closer relation between the operating and the selling departments. The distributing department will act as an adviser to the mining officials, for the men who sell the coal are better informed regarding the demands and needs of their customers than the man in the production department.

Inspections Made by Traveling Experts

The Pennsylvania Coal & Coke Corporation, with operating offices at Cresson, Pa., is obtaining from its mines a more highly merchantable coal by laying greater stress on rigid inspection, on correct mining methods and on the preparation of its coal. The corporation has thirty mines within a radius of 25 miles of Cresson. Four seams are being mined, with an average thickness of 42 in. They are known locally as the B, the C′, the D, and the E seams. The names of the beds are the Lower Kittanning, the Upper Kittanning, the Lower Freeport and the Upper Freeport respectively.

Three coal inspectors are employed to supervise the mining and the preparation of coal. Each man travels from mine to mine, and makes his visits entirely unannounced. In this way the miners and officials at each mine are kept "on their toes" at all times. The length of time between these visits varies from mine to mine.

Note.—Headpiece shows testing laboratory of the Warner Laboratories, where tests of the coal of the Pennsylvania Coal & Coke Corporation are made.

FIG. 1—REPORT FORM FILLED IN DAILY BY EACH INSPECTOR

Mines with a reputation for producing clean coal, as disclosed by analyses, are visited less frequently than those which do not maintain their standard so unerringly.

These men are not coal inspectors as we understand the term—they do not merely examine superficially the coal in the mine wagons or the railroad cars. Rather, they combine the functions of company mine inspectors with that of coal-preparation advisers. An inspector spends at least one whole day at the mine at each visit. Arriving in the morning, the forenoon usually is spent on the surface about the tipple.

As all the seams mined in this region outcrop, all the mines are entered through drift openings. The inspector stands on the load side of the tipple and removes a shovelful of coal from each mine car as it passes him. Thus he accumulates a sample that is truly representative of the output of practically the entire mine. This weighs from 1,200 to 2,000 lb. This is crushed and then quartered until a 5-lb. sample is obtained, which is sent to the chemical laboratory for analysis. He also examines the coal in each car as it passes, and, should the coal in any car show enough refuse to indicate that the coal is mined or loaded carelessly, he makes a record of its appearance and of the check number that the car bears.

In the afternoon the inspector goes underground and inspects the working places, in particular those from which he has noted that dirty coal is coming. Arriving at such a place he first makes a careful examination of conditions, studying the roof, the seam and the bottom, and seeking to determine the reason why the coal from this point is below the standard, so as to ascertain whether the carelessness of the miner or the physical condition of the seam is the cause of the impurity. If he believes that the miner is not to blame, he advises him as to the manner in which cleaner coal may be obtained.

Should he suspect the miner of carelessness, he questions the latter with reference to the mining methods employed. The miner is cautioned to be more careful in the future, and the mistakes in his mining or loading methods are explained to him. The offender, moreover, is disciplined in accordance with the clause in the union agreement regarding the loading of dirty coal. If underground regulation does not improve the quality of the coal, then surface preparation is bettered either by placing more men on the picking table or by other means.

The inspectors not only take samples of the run of the mine but sample the coal at the face. This is done in accordance with the standards of the U. S. Bureau of Mines, the coal being removed in three vertical channel cuts, one being taken at each of the ribs and one in the middle of the face. The coal is crushed and quartered until a 5-lb. sample is obtained for analysis.

When the system was first put into effect, representative faces in the several working sections of each mine were sampled and analyzed. As occasion has demanded, further samples have been taken. This becomes necessary whenever the run-of-mine analysis shows too high a percentage of ash and sulphur and a given section is suspected, or whenever a given section has advanced considerably since the last sample was taken.

This system opens up a wide field for a "better coal" movement. As time goes on new ideas will crop up to better it, and a better working basis will be established. At one of the mines the analyses of the coal at the face are recorded on a special map. At another mine the check numbers of the miners are noted on the map opposite their respective working places. It is likely that in the future such graphical records will be prepared and maintained for all the company's mines.

Can Trace Bad Coal to Rooms Producing It

The chemical composition and the character of the beds in the Lower Productive Measures, especially the Freeport seams, are known to vary (sometimes considerably) within the bounds of a single acre. This phenomenon is not conducive to a uniform shipment. One of the purposes of the system is to supply the customer with a coal the heating value, ash-fusing temperature and proximate analysis of which will vary but little. The corporation is familiar with the physical and the chemical character of the coal at the several working places in their mines. Only with this knowledge can the official determine a possible constant in composition and work to attain it. Orders usually are filled to satisfy certain specifications.

Record is kept of the check numbers on the mine cars, the contents of which are loaded into any one railroad car. The record is filed away so that should a complaint be made the loading schedule may be adjusted to remedy any shortcoming. Each check number gives information at once as to the miner, place and coal composition.

Each coal inspector is provided with a form for a daily report which he fills out at the close of the day's run. This form is shown in Fig. 1, and it affords an excellent digest of facts. By comparing the periodic reports of the same mine a definite conclusion may be reached as to whether the output of the mine is uniform, improving or declining in quality. It also affords a means of comparing different mines. The report blank is practically self-explanatory. As may be noted, an opinion as to the efficiency of the coal preparation may be formed by studying the reports. The effect of placing a large or smaller force of men on the picking tables and on the railroad cars is shown by the ash and sulphur percentages which the chemist supplies.

The analyses are made by the Warner Laboratories, located near the operating offices at Cresson, where an experienced graduate chemist runs all the chemical analyses, which are more detailed than those usually made by coal companies. All the determinations are made in accord with the U. S. Bureau of Mines' Standards. Referring to Fig. 2 it will be noticed that a com-

plete record is made of both the method of sampling and the results of analysis. Not only is a proximate analysis made but the sulphur content, the thermal value and the fusing temperature of the ash are ascertained.

A representative analysis of the Lower Kittaning seam, marketed as Webster coal, copied from an analysis and coal sample report chosen at random shows that the ash varies between 6.13 and 6.58 per cent and the sulphur between 1.19 and 1.43 per cent. The heating value ranges between 14,600 and 14,700 B.t.u. The fusing temperature of the ash is 2,600 deg. F. The coal from the other three seams, tradenamed the Pardee coal, has an ash value of 6.32 to 6.61 per cent and a sulphur content of 1.09 to 1.33 per cent. The heat value of this coal is about 14,500 B.t.u.

The coal inspectors' daily reports are filed away, those from each mine being kept in a separate folder. If a complaint is received from a customer, it is filed away in the folder of the mine from which the shipment was made, adjacent to the nearest report either before or after the shipping date. The mine superintendents meet in conference periodically. The records of each mine in individual folder form are conveniently accessible for reference at these times.

The coal inspectors soon develop marked proficiency in their work. Because they specialize on this one phase alone and because of their experiences at a number of mines they become experts in their line and readily determine the cause of dirty coal and are able to suggest a remedy. Neither the mine foreman nor the superintendent has time to accomplish the results attained by the inspectors. An impartial outsider will grasp the situation more readily and bring about the necessary change in methods with more expertness than a man who has given the subject less attention and has had a narrower experience. A system such as this results in better and better coal as the wrinkles in its operation are ironed out.

FIG. 2—CHEMIST'S REPORT BLANK

Spillertown Sam Dead; Aged 32 Years

Spillertown Sam was in the coal business over twenty-six years. He died on Dec. 24, 1922, at the Peabody company's No. 3 mine, Marion, Ill., at the ripe old age of 32 years. Spillertown Sam enjoyed a life of ease for the past six years on a Peabody Coal Co. pension. The company provided him with a ten-acre field, well wooded to shelter him in the summer time, and a comfortable barn with an attendant to take care of him. While in active service this mule averaged twenty miles per day, year in and year out, underground, hauling coal and never met with an accident serious enough to incapacitate him for work.

Institute to Canvass Subsidence of Mines

WHEN the American Institute of Mining and Metallurgical Engineers meets on Feb. 19 it will take up on the first day the subject of "Ground Movement and Subsidence." In fact this is one of the more important subjects relative to coal mining that will be presented at the 127th meeting. H. N. Eavenson will offer the main subject at 9:30 a.m. on the opening day. Someone will then offer some remarks on subsidence in Southwest coal mines and George S. Rice will speak on the subject of "Problems of Ground Movement and Subsidence," illustrating his article on the screen. J. Parke Channing will present a paper entitled "A Study of Subsidence at Miami, Ariz.," and an address will be delivered on "Ground Movement and Subsidence at the Inspiration Mine."

In the afternoon two papers will be delivered on the breakage of tool steel, its hardness and the relation of heat treatment to both, and the industrial relations section will discuss Americanization, cripples in industry, education, employment, housing and recreation, mental factors in industry, sickness prevention and safety.

To Discuss Standardization of Mine Maps

A meeting of the mining section will be held the next day on "Mining Methods at the Marquette Mine" and on the "Standardization of Mine Maps." At this meeting a report will be made on the classification of mine methods. A coal-mining section will at the same time be addressed by Thomas Fraser and H. F. Yancey, their subject being "Interpretation of Results of Coal-Washing Tests." A. B. Crichton will address the institute on "Mine-Drainage Stream Pollution." Edward O'Toole will give a paper on "Unit Costs in Coal Mining in the Pocahontas Field," using units of labor and material per unit of accomplishment as the means of deriving these unit costs, that being the method of presentation requested by the mining methods committee.

In the afternoon M. W. Ditto will describe the "Design and Operation of the Roberts Coke Oven"; A. R. Powell, "Forms of Sulphur in Coal and their Relation to Blast-Furnace Reactions"; R. A. Sherman and John Blizard, "Combustion in Fuel Beds of Blast-Furnace Cokes"; G. H. J. Perrott and S. F. Kinney, "Combustion of Coke in Blast-Furnace Hearth."

In the afternoon a mining session will be held in which C. E. Barneveld will discuss "Mechanical Loaders at an Underground Mine." In the mining session of the following morning Galen H. Clevenger will speak on Liquid-Oxygen Explosives." A joint session of the committee on industrial relations and the mining section of the National Safety Council will discuss under the chairmanship of B. F. Tillson "Hoisting Ropes and Safety Devices for Mine Shafts."

Session on Mechanical Loaders Underground

In the afternoon another meeting of the same kind will be held under H. F. Lunt's chairmanship. At this will be discussed "Mine-Fire Prevention," "Preparations for Fighting Mine Fires," "Industrial Psychiatry" (Jau Don Ball), "Industrial Relations of Tennessee Copper Co." (J. N. Houser, general manager of company) and "Industrial Community Problems at Brewster" (H. L. Mead, of the American Cyanamid Co.). Concurrently addresses will be made on the "Practical Results Obtained from Psychological Tests at Columbia." (Adam Leroy Jones), "Relations Between the Mining Industry and the Technical College" (F. W. McNair) and "Training of Engineering Students" (E. P. Mathewson).

The social luncheons so much appreciated in former years will be held on all three days with special dinners on the first night for three of the divisions, one of these being the industrial relations committee. These dinners will be followed by a smoker at headquarters. On the second day a dance will be held and on the third the reception to the Italian Ambassador at Washington, Prince Gelasio Caetani, which will be followed by the annual dinner. The business meeting will be held on Tuesday morning, Feb. 20, before the regular business of the day commences.

Proposed Legislation Prohibits Deduction Of Capital Losses Above 12½ Per Cent

DEDUCTION of capital losses in excess of 12½ per cent is precluded by legislation likely to be adopted at this session of Congress. The proposal is to amend the revenue act of 1921 so that a taxpayer may not be allowed a complete deduction of capital losses incurred. Both the revenue acts of 1918 and 1921 have left this gap through which many have escaped from income taxes.

It is pointed out that an injustice is done the taxpayer in that an increment frequently accumulated over a period of many years is taxed at a high surtax rate when the property is converted into cash in a given year. The net profit is arbitrarily attributed to the year in which the sale took place. In addition there was a severe restraint on sales at a profit. Many transfers of property were prevented when the transfer was highly desirable from the standpoint of economic development.

The act of 1921 provided that the tax on capital gains in the case of property acquired and held by the taxpayer for profit or investment for more than two years should be limited to 12½ per cent, but no such limitation was placed on capital losses. The injustice to the government is exemplified by Representative Mills of the Ways and Means Committee as follows:

"The taxpayer may refrain from taking his profits, or, if he does take them, he pays but a 12½ per cent tax, whereas he is at liberty at any time to take advantage of losses that may have been incurred and avail himself of a full deduction from his income. In the case of a man with an income of $350,000 a year, assume that he bought 5,000 shares of stock X in 1917 at par, and that he sells the shares in 1922 for $600,000, showing a profit of $100,000. By reason of this transaction, he would pay, in addition to the tax on his regular income, $12,500 to the government. But assume that instead of selling this stock at a profit he sold it in 1922 at a loss of $100,000. He then would be entitled to deduct the $100,000 from his income of $350,000 and the loss to the government by reason of that deduction would be $58,000."

In many cases, it is stated, only paper losses are involved. Securities may be sold at a price less than that paid for them, thereby setting up a loss which is deductible from income. After thirty days these same securities could be repurchased, or immediate purchase could be made of securities of a similar class and of the same value, which would allow the taxpayer a substantial loss for his income tax purposes, but his real financial position would be the same as before the sale.

Book Reviews

Modern Gas Works Chemistry

GAS-WORKS chemists seemingly are in the same unfortunate position as the mechanical and electrical engineers of coal mines. In "Modern Gasworks Chemistry," Geoffrey Weyman, chief chemist to the Newcastle on Tyne and Gateshead Gas Co., says: "Often enough the chemist is superimposed upon an existing organization and, without definite position or authority, is expected to show a substantial increase in economy. To the qualifications of training and ordered knowledge must be added, therefore, one of tact. The chemist is variously regarded as a nuisance, as a necessary evil to be tolerated as far as may be, as a sort of spy in charge of 'tell-tale' instruments or as an amusing trickster. In the long run he must trust to the result of his work to make his position one of reference by both workman and manager; until from being an excrescence, the laboratory takes its place as the nerve center of the works." If the word "chemist" were replaced by "electrical engineer" and "laboratory" by "switchboard" the statement would be scarcely less apt.

However, we cannot quite agree with Mr. Weyman in his enthusiastic dictum: "Could coal be so treated that the value of the byproducts would allow the gaseous therm to be distributed as cheaply as the therm in the form of raw coal, the increased efficiency with which the former may be used would render carbonization of extreme importance and would go far to stabilize the industrial conditions of this country" [England]. The reviewer may be pardoned surely for saying that the gaseous therm will not displace the therm in raw coal, for the electrical unit already is driving the latter out. Certainly gas is not going to oust electricity for power purposes, in general service, for nothing is so economical or so readily handled as electricity.

Still gas will continue to have its place, and this authoritative book will serve not only the chemist who makes gas but also the mine operator who must fit his product to the needs of those who desire to use it. And here it may be wondered that the author of this volume has so little to say as to clinker. He seems not at all interested in high-temperature fusibility and questions whether in the future the practice may not be to seek a low-temperature clinker that will run and not arch, obtaining this condition by the use of added fluxes. He believes that a clinker could be attained that would run through the fire bars into the ashpit.

He also questions whether it is better in the manufacture of producer gas to use a high fire temperature, completely burning the fuel and forming clinker, or to keep the fire comparatively cool and recover coke from the ashes, and concludes that this is a matter for individual consideration. This is indeed a new light on a problem which has been troubling coal men. Hitherto chemists have been urging that coal be used that, in burning, will leave at high temperatures only ash and not clinker.

The author's chapters deal with Coal, Carbonization, Coke, Maintenance of Heats, Refractory and Insulating Materials, Tar, Ammonia, Oxide Purification, Town Gas, Water Gas, Steam Raising and Water Supply and Lubricants. The treatise contains 184 pages measuring 7x9½ in. It has 42 illustrations and is one of the recent publications of Benn Bros., Ltd., 8 Bouverie St., London, E.C.4.

Unveiling the Romance of Coal Mining

IN A volume of 310 pages Charles R. Gibson has essayed, not without considerable success, to record "The Romance of Coal" and give a "popular account of the origin and nature of coal, the forces and qualities destructive or beneficial which lie latent in it and the great variety of uses to which they may be turned to science, art and industry." To those who are interested in the history of coal mining this book will greatly appeal. Mr. Gibson's qualification for his task is found mostly in his sense of the human interest in the subject he is considering.

A few of his statements are remarkable. For instance, in his chapter on "The Crust of the Earth" he declares that quartz is a silicate of alumina. As he recognizes sand as being coarse quartz he differentiates sandstone from clay and shale by saying that the particles in the latter are finer than those in the former. The reader of this review hardly will need to be told that sand is silica, or quartz, and that fireclay and shale are for the most part silicates of alumina, though fine particles of silica can be found in fireclay as in gannister clays.

Again in the chapter on "The Origin of the Varieties of Coal" he expresses the belief that anthracite has been formed by "great veins of igneous rocks being introduced among the coal beds," which is neither true in general nor happily expressed. He uses the word anthracite loosely, as is the English manner, saying that "its greatest field of labor has been in the Navy, because of its smokelessness," which is not true if the word "anthracite" is used, as he says, to cover coals which contain 93 per cent and upward of carbon. Coal so high in carbon as 93 per cent is indeed almost smokeless but is not used for naval vessels.

He also says that anthracite has little ash, which is true of the British product but is not necessarily true of all. Its freedom of ash where found is adventitious and not a quality to be expected. Anthracite must of necessity have a larger percentage of ash than the bituminous coal from which it has been formed.

The book admirably shows how the workers in the coal fields were the source of nearly all our industrialism, not only furnishing the power but devising and developing the steam engines by which industry operates. There is truly much romance in the industry that created the first railroads, the first steam locomotives and the first steam pumps and which has even today many unusual problems to surmount. Mr. Gibson faithfully and interestingly chronicles that romance. The book is issued by Seeley Service & Co., of London, but is republished by J. B. Lippincott Co., of Philadelphia. The pages measure 5x7¾ in.

TESTS MADE AT THE PITTSBURGH (PA.) experiment station of the Bureau of Mines to determine the nature of gases rising from the fuel beds of different kinds of coke show that the composition differs very little. These tests will be continued to see if the combustibility of coke varies with the size of the pieces.

Problems of Operating Men

Edited by James T. Beard

Dumping Mine Cars by Rotation —Not a New Idea

Priority Claims Refuted — First Installation of Ramsay Patents in Alabama Ore Mines—35-Car Trip Dumped at One Time

SOME time ago, I recall reading an interesting article describing the installation of a skip hoist and rotary dump on the shaft bottom of the Zeigler No. 1 Mine, in Illinois (Vol. 21, p. 871). A brief item that appeared more recently in *Coal Age* (Vol. 22, p. 8), written by Clarence R. Claghorn, reminds me of the claims of priority set forth in the previous article, which it appears was written by E. W. Davidson. In this second reference, Mr. Claghorn makes similar claims of priority for a like installation at Wehrum, Pa.

In his brief article, Mr. Claghorn makes the claim that the Zeigler installation of the rotary dump and other equipment was patented after a similar installation, made underground, at the Wehrum (Pa.) shaft mine of the Lackawanna Coal & Coke Co., in 1903, both installations having been built by the same firm.

Development of Ramsay Rotary Damp and Later Installation at Zeigler, Ill.

During my service as division engineer of the Tennessee Coal, Iron & R.R. Co., in charge of its ore mines, for the years 1898 to 1900, inclusive, I was closely associated with Erskine Ramsay, chief engineer and assistant general manager of the same company. At that time Mr. Ramsay gave much thought to the study and development of the rotary dump.

Probably the first installation of this type of equipment was made at the Smythe Slope, Ore Mine, on Red Mountain, near Birmingham, Ala. That was a multiple five-car rotary dump of Mr. Ramsay's own design. About the same time and for the sake of comparison, he also installed, at the near-by Spring Gap Mine, the first slope, skip hoist in the state. The same was later adopted at many other Red Mountain mines.

Although the pneumatically operated Ramsay dump, at Zeigler, Ill., was not installed until 1917, the patent covering that installation (No. 701,764) was granted to Mr. Ramsay June 3, 1902. Mr. Ramsay had arranged with the Wood Equipment Co., who manufactured for him the earlier installations of this type of equipment, to allow the Car Dumper and Equipment Co., of Chicago, to manufacture and install the plant at Zeigler, Ill. Just here, it should also be observed that the patent covering the Zeigler installation was granted to Mr. Ramsay about a year prior to the application for the Wehrum (Pa.) patent mentioned by Mr. Claghorn.

From the foregoing statements it will be seen that the Zeigler installation is by no means the first rotary dump set up under the Ramsay patents. The idea of dumping material by rotary motion has been under development, now, for nearly a quarter of a century and Mr. Ramsay is one of the well-known pioneers in that development.

The Ramsay, rotary method of dumping an entire trip of cars in a single operation had its earliest practical demonstration, in coal mining, when a multiple, rotary dump about 175 ft. long and handling trips of 18 cars was installed, in 1914, by the H. C. Frick Coke Co., at its Lemont No. 2 mine, near Uniontown, Pa.

Other Installations of Ramsay Multiple Rotary Dumps in Pennsylvania

A little later Edward H. Coxe, then manager of the Tennessee C., I. & R.R. Co. and, now, general manager of Snowden C. & C. Co., installed a 28-car slope dump 275 ft. in length, the largest then in existence. This installation was made by Mr. Coxe, at this company's mines near Brownsville, Pa.

It will not betray any secret, I hope, to state that the H. C. Frick Coke Co. is about to install two Ramsay, rotary dumps, each having a capacity that will enable it to handle a 35-car trip at a single time. Each of these dumps will be nearly 400 ft. in length and located underground. The operation of dumping a full motor trip on its arrival at the station will require but ten seconds.

In this connection, it will be of interest to state that the first single-car, rotary dump, designed to dump one or more cars at a time without uncoupling the cars from each other or from the motor, was installed several years ago and operated, under a Ramsay license, by C. P. Perin, at his new Keokee Mine, Va.

In this type of dump, use was made of a swivel coupling that permitted the cars on the dump to turn over without being uncoupled from the trip. Numerous other dumps of this type have since been installed and are in operation in various parts of the country.

Many Installations of Same Dump in India

The C. P. Perin engineering firm of New York, which for many years has represented the great Tata coal, iron and steel interests of India are now installing a single, rotary, five-car dump made for them by the Ramsay agents, the Car Dumper and Equipment Co. of Chicago.

This dump is designed for a double-track slope, having the hoisting rope attached to the loaded and empty trips, respectively and passing backward and forward through the dump, the two branches of the rope running always in opposite directions. As in gravity-plane haulage, the two trips act in balance and the five cars in each alternate trip will be dumped at one time without the cars being uncoupled from each other or from the hoisting rope.

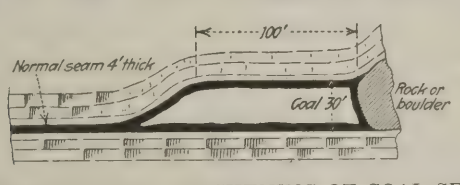
This installation will duplicate the one installed by the same company, in 1918, at the A. J. Morgan Coal Co.'s Bellaire Mine, in Ohio. I understand that this

novel arrangement is the only one of its kind in the world. The idea marks a great advance from the original swivel coupling of the Koekee Dump of which mention has been made. Previous to that time, the same firm had installed, in India, three other Ramsay dumps.

Pioneer in Mine Equipment

Through my long association with Mr. Ramsay, in the development of his rotary dump adapted to the varying conditions of shaft, slope and drift mines, I do not hesitate to say that he has made notable advances in providing various equipment that reduces the cost of production, by the increased efficiency effected in operation.

The numerous devices designed by Mr. Ramsay include mine cars, brakes, wheels and couplers, besides caging arrangements, individual mine-car samplers and various types of feeders for screens and crushers. His shaking screens date back to the first installation of that kind of equipment ever made at American bituminous mines. Such an installation was made by Mr. Ramsay himself, in 1890, at the Pratt slope, Mine No. 4 of the Tennessee C., I. & R.R. Co. H. A. Turner.



Birmingham, Ala.

Extraordinary Conditions Met in Working Coal Seam

Normal thickness of 4-ft. coal seam increases suddenly to 30 ft.—Conditions much disturbed in coal and roof —Coal entirely cut out by rock—No trace of seam beyond.

EXPERIENCES through which we have recently passed caused me to read the article of I. C. Parfitt entitled "Locating the Coal Beyond a Fault," *Coal Age*, Nov. 16, p. 799, and that of W. H. Luxton, Dec. 28, p. 1042, with the deepest interest.

My hope of finding in these articles the solution of a condition we have met in the working of a normally 4-ft. seam of coal in one of our mines in the southern part of Pike County (Ky.), was doomed to disappointment, however, as the conditions referred to in those articles were of an entirely different nature from those against which we have been striving for some time past.

EXTRAORDINARY THICKENING OF COAL SEAM

Conditions Before Boulder Cuts Out Seam

In a rough way, I have attempted to illustrate, in the accompanying figure, the conditions as we have found them. Previously, the coal, in our seam, had maintained a uniform thickness of 4 ft. and was overlaid with a hard slate top, the bottom being of a like nature. As indicated in the figure, we suddenly observed a rapid increase in the thickness of the coal, which continued till a height of 30 ft. was reached.

This thickening of the seam occurred within a distance of forty or fifty yards. Then, we ran into what appeared to be a huge rock boulder or horseback, which cut out the coal completely. To make the situation more clear I will explain that we have since driven all the places on the left of the main haulage roads and the main headings themselves up to and into this faulted condition.

In our efforts to ascertain the condition existing in the strata beyond, we not only drilled holes up in the roof and down in the floor of the seam; but have been prospecting on the other side of the mountain, about a mile ahead of the present development in the mine. The prospecting showed that what is probably the same seam of coal as that worked in the mine, outcrops about 20 ft. higher, in elevation, on the mountain, where it has a normal thickness of 4 ft.

I shall watch with interest for accounts of similar experiences of others, which I am sure will appear in these columns, together with some practical explanation of such an extraordinary thickening of the coal, before the seam was finally cut out by the rock.

Pikeville, Ky. Superintendent.

Stunt in Timbering Haulage Roads

Opinions vary in regard to the setting of temporary posts—Discussion brings out practical stunt to prevent a wreck on haulage road from dislodging timbers.

THAT post timbers have been set without taking proper care to insure the timber fulfilling its purpose and that this has proved the source of many accidents, will not be questioned by any practical mining man. While this introduces no new doctrine in mine timbering, it is strange to observe that many people hold varying opinions in regard to some of the simplest points in timbering.

I am led to make these remarks after listening to a discussion, by the members of a mining class, on the question of setting post timbers. The discussion developed the fact that some of the men present did not believe that special care was required in the setting of a temporary post. They argued that the arrangement was only temporary and would shortly be replaced by something better.

Temporary Posts Require Care in Setting

In order to bring about a thorough understanding of their viewpoint, every effort was made to explain clearly their meaning. Approaching the question from every angle, however, only brought the reply that "A temporary post is only a makeshift, and the taking of special care in its setting is a waste of time."

It is gratifying to know, however, that the greater number of the men present at that meeting were strongly in favor of setting even temporary posts with the same care that would be taken in the standing of permanent timber.

In support of this opinion, it was stated that "the same protection was expected of a temporary post as of a permanent timber, as long as the former was thought to be required." If that was not the case, it was asked, "Why set the temporary posts at all?"

Discussion Always Develops Good Points

A discussion always brings out some good points and this one, incidentally, led to the mention of a specially good piece of entry timbering, by a motorman whose experience caused him to view the subject of timbering from an angle that mostly interested those who, like

himself, had to haul the coal on the main roads and entries in the mine.

This motorman stated that, on two separate occasions, he had learned that it was possible for a wreck to occur where a branch entry joined the main road and cars were broken to pieces, while not a timber was dislodged by the cars thrown against it.

At that point, the two roads were joined by a long curve that made it necessary to set substantial ten-inch posts on each side of the road. Each heavy post was set in a foothold notched into the bottom. With some extra effort, a rounded bowl-like excavation was cut in the roof.

In the setting of each post four soft cap-boards were driven, above the post from the four points of the compass, north, south, east and west, whereby the post was wedged so firmly that the bump of a car from any direction could not dislodge the timber. All present agreed that the plan was a good one, whenever it was possible to cut the roof to the required bowl shape.

Pikeville, Ky. GEORGE EDWARDS.

Inquiries Of General Interest

Effect of Drawing Pillars on Production of Squeeze

Working the Miller or "B" Seam, in Pennsylvania—General Plan of Mine Outlined—Question of Drawing Pillars Discussed with Respect to Causing Squeeze.

IN THIS district, we are working what is known as the "Miller or B seam" of coal. The coal has an average thickness of about 3½ ft. and is overlaid with a fairly strong roof, and has a cover of about 250 ft. The bottom or floor of the seam is soft and wet, but there is no water in the roof. Throughout the district this coal lies fairly level with some local dips and rises.

The general plan of working adopted in our mine is to drive the main headings three abreast. The cross-entries or what we term the "panel entries" are also driven three abreast and are turned at right angles to the main headings. The room headings, however, are driven on the double-entry system and turned at right angles to the panel entries.

The room headings follow the general rise of the seam, as far as this is practicable. The rooms are turned as the headings advance, there being thirty rooms on each pair of headings. These thirty rooms form a panel and the question on which we desire the opinions of *Coal Age* and its practical readers has reference to the best method of working out a panel, in order to avoid as far as possible the occurrence of a squeeze.

In other words, I want to ask for an expression of practical judgment as to whether there will be less liability to develop a squeeze, by delaying the drawing back of the pillars in each panel of thirty rooms, until the panel is complete and the pillars can all be drawn back at the same time.

The system that has been employed quite generally is to draw back the pillars as quickly as the rooms reach the limit. The argument in favor of this plan is that the timbers and tracking in the rooms are then in good condition; but, owing to the soft, wet bottom, they are not liable to maintain this condition for any length of time. The experience of others in this regard will be greatly appreciated. ROBERT HOLT.

Indian Head, Pa.

In order to give the most intelligent answer to this question one should be thoroughly familiar with the conditions in the district, and know the effect of the soft, wet bottom on the life of the timber and tracking. Also, it is of equal importance to know the effect of drawing the pillars, in the locality in question. These effects can only be determined accurately by practical trial. Some mine water is more destructive of timber than others.

Again, the character of the roof formation in a mine will determine its action in hastening a squeeze. The depth of cover, stated in this case as about 250 ft., does not give sufficient information on which to base an opinion regarding the effect of drawing the pillars in the rooms.

The outstanding features of the information before us are the wet, soft bottom underlying the seam and the fairly strong nature of the roof above. Working under a cover of 250 ft. the roof pressure will be sufficient to force the pillars into this soft bottom. The effect will be all the greater with a fireclay floor owing to the water in the bottom swelling the clay. There is sure to be a tendency of the bottom to heave, in that case, and it can only be in part counteracted by increasing the ratio of pillar to opening, particularly when driving rooms.

For example, assuming the rooms are driven on 40-ft. centers, with a width of 24 ft. and 16-ft. pillars between them, there will invariably result a heaving of the bottom, which may be largely or wholly prevented by driving say 16-ft. rooms with 24-ft. pillars between them.

As stated previously this is a chief feature of the proposition here presented and outweighs, in importance, even the question of drawing back the pillars as the several rooms reach the limit, or delaying the work of robbing the pillars, till the panel is complete. Regarding that question alone and assuming the timber and tracking are not injured by the delay, to an extent that will require their being replaced, there will often be an advantage in drawing back the pillars in a panel at one time. Judging from the data afforded, however, we cannot advise this in the present instance.

Finally, taking everything into consideration, we would suggest turning and driving the rooms forward, in regular order, as the room headings are advanced; and drawing back the pillars as quickly as each room reaches the limit. Care should be taken, however, to keep the line of pillar work fairly straight, to prevent an undue pressure on the end of any pillar.

In the effort to avoid any tendency to squeeze or creep, in the working of this seam, the main points to be borne in mind are keeping the roads well drained and maintaining a sufficient ratio of pillar to opening that will reduce the roof pressure to a safe limit. This can only be determined by trial in the district. The aim should be to work out the coal and allow the roof to settle in the waste as quickly as possible. Large standing areas should be particularly avoided and regularity of work is likewise important.

Examination Questions Answered

West Virginia Mine Foremen's and Firebosses' Examination, Charleston, 1922

(Second-Class, Selected Questions)

QUESTION—*Name and describe the different systems of haulage with which you are familiar and state to what conditions each is best adapted?*

ANSWER—The several systems of mine haulage in use are the following: Mule haulage; different types of rope haulage and locomotive haulage. Mule haulage is used on the main roads, only in small mines, and for gathering the cars at the working faces in larger mines, the mule being better adapted for hauling cars under these conditions.

Rope haulage includes the following: (1) Gravity-plane haulage is where the descending loaded cars partly balance the ascending empties and no power is required to operate the system. (2) Engine-plane haulage is employed where it is necessary to haul the loads up an incline or slope, the engine being located either at the top or bottom of the incline. (3) Endless-rope haulage, is used where the cars are hauled in and out of the mine by means of an endless rope, which passes from the winding drum of the engine back to the tail sheave located at the inby parting, in the mine, and thence returning to the engine at the tipple. Both the loaded and the empty cars are attached by suitable grips, at regular intervals, to the rope that runs continuously. (4) Main-and-tail rope haulage is where two ropes are used to haul trips of cars in and out of the mine. The main rope extends from the winding drum of the engine at the tipple back to the inby parting in the mine where it is attached to the head end of the loaded trip. The tail rope, on the other hand, extends from the winding drum of the engine and, after passing over the tail sheave, at the inby parting, is attached to the rear end of the trip. By means of these ropes, alternate loaded and empty trips are hauled out of and into the mine.

Gravity-plane haulage is adapted to moderate inclines over which the loaded cars are lowered. Engine-plane haulage is adapted to steeper inclines and where the loads must be hoisted. Endless-rope haulage is adapted to large outputs of coal in generally flat seams. Tail-rope haulage is better adapted to undulating seams that are generally flat.

Locomotive haulage is adapted to large outputs in generally flat seams and on moderate grades. The locomotives are operated either by compressed air or electricity. An electrical locomotive may be either one of the trolley type that receives its power from the trolley line or storage batteries carried in the locomotive may supply the power, being recharged as required.

QUESTION—*(a) What is the area and perimeter of an airway 9x12 ft., in section? (b) If the volume of air in this airway is 72,960 cu.ft. per min. what is the velocity of the current?*

ANSWER—(a) The sectional area of the airway is $9 \times 12 = 108$ sq.ft.; the perimeter of the airway is $2(9 + 12) = 42$ ft.

(b) The velocity of the air current, in this airway, is $72{,}960 \div 108 = 675.55$ ft. per min.

QUESTION—*(a) Give the area and perimeter of an airway 6x13 ft., in section. (b) If the airway is 7,000 ft. long what is its rubbing surface?*

ANSWER—(a) The sectional area of this airway is $6 \times 13 = 78$ sq.ft.; and perimeter $2(6 + 13) = 38$ ft.

(b) The airway being 7,000 ft. long, its rubbing surface is $7{,}000 \times 38 = 266{,}000$ sq.ft.

QUESTION—*What condition could arise, in a coal mine that is ventilated according to law and employing 102 men, that would necessitate increasing the amount of air in circulation, without increasing the number of men employed?*

ANSWER—The gaseous condition of the mine air may increase to an extent that would require a larger circulation of air, in order to dilute, render harmless and sweep away the gases generated. It is not sufficient to gage the volume of air in circulation by the number of men employed, alone. The quality of the air, as determined by the percentage of oxygen present, must also be considered. The presence of mine fires existing in the gob or waste areas, in a mine, consume the oxygen of the air and increase the quantity required for the ventilation of the workings.

QUESTION—*(a) What are the effects of windy or blownout shots? (b) What precautions would you take to prevent them?*

ANSWER—(a) A windy shot is one where a portion of the powder forming the charge is blown from the hole and exploded in the air, causing a sharp concussion of the air in the mine workings. In that case, an excessive charge of powder was used, the amount being more than that required to break down the coal.

A blownout shot, though producing more or less the same effect in the mine air, differs from a windy shot by blowing its tamping and not breaking down the coal. In this case also, a portion of the powder is exploded on the air producing the same concussion of the air in the workings.

(b) To prevent the occurrence of a windy shot, the excessive use of powder must be avoided. Experience will generally determine the weight of charge required to perform the work desired. Again to prevent the occurrence of a blownout shot it is necessary to locate the charge in such a position in the coal that the line of least resistance, as measured from the charge to the free surface of the coal, is less than the depth of the hole. The charge must be well tamped, and only permissible powder should be used.

QUESTION—*Specify the conditions which must be fulfilled in order to secure good ventilation in a mine.*

ANSWER—In the first place, the quantity of air in circulation must be at least equal to the requirements of the mining law. Secondly, the volume of air entering the mine must be divided into two or more separate splits, as conditions may require. Each air split is made to ventilate a separate section of the mine and returned to the main air-course, without passing into other sections. The velocity of the air at the working face, in each split, must be sufficient to sweep away the gases that would otherwise accumulate therein. The velocity of the air current at the face should not exceed 6 ft. per second and will often be less to insure the comfort of the workers.

How the Coal-Mining Industry in the Saar Basin is Governed

By C. H. S. Tupholme

NO DESCRIPTION or statement on the conditions or control of the coal mines in the Saar area can be appreciated or is complete without reference to the somewhat hectic history of the neighborhood. This is important because the Saar basin has a political and industrial position which is immensely significant both in France and Germany. The basin had always been French until 1815, when, after Napoleon's defeat at Waterloo, it was given to Germany, the French eastern boundary being pushed west to the Alsace-Lorraine line. Much argument centered round this point after the last war and eventually the rich coal area of the Saar was taken over by France.

A somewhat complex administrative situation exists in the Saar basin owing to the existence of the Saar Governing Commission. This commission owes its existence to a ruling of the League of Nations and operates entirely independently of either the French or the German government. It is indeed invested with the entire governmental authority which would otherwise be exerted by the French or German government, until 1935, when the inhabitants will have the opportunity to decide whether they will assume French or German nationality or will continue to be hybrids under the League of Nations.

Contrary to a somewhat popular idea the Saar Governing Commission has very little indeed to do with the actual administration of the coal-mining industry of the Saar Basin. Its influence is evident, however, in matters directly affecting the industry. For instance, the Saar Governing Commission has made itself actively responsible for the erection of working-class dwellings, many of which will be occupied by the coal miners.

Responsibility for the actual operation of the coal mines in the Saar area rests with the French Mining Administration, which, by the Treaty of Versailles, is invested with certain peculiar rights. Thus, though the 75,000 workers are almost entirely of German extraction the French Mining Administration has the right to circulate French currency to any extent it wishes. Consequently all projects undertaken in the Saar area are financed in francs and materials and labor are paid for in French coinage. But, in spite of this, German marks also are in circulation. The result is obvious: All kinds of peculiar economic and political situations have arisen.

Germans Glad to Receive Pay in Francs

Naturally, the German coal miner in the Saar has no objection to being paid in francs. Compared to his brother in the building trade he is very well off, and the deeper the mark goes into the mire, the greater is the satisfaction of the German coal miner who is paid in francs.

This policy of the introduction of the franc as the official basis of currency in the Saar cuts both ways. With the gradual decline in the value of the mark this policy means that the German industrial operator cannot afford to buy Saar coal. Consequently there has been a marked fall in production under the French system of control. Instead of an output of around 15,000,000 tons per annum, which was the output under German administration in 1913, the present production is under 10,000,000 tons, and it is likely to fall still further if no factor enters to counteract the effect of the fall in the value of the mark.

The government of the Saar Basin coal-mining industry by the French Mining Administration may have its drawbacks from the German point of view, but to an unprejudiced observer there is no cause for complaint. The present administration has raised individual output from 500 to 600 kilos per day and the workers in the mines are contented. The industry, in fact, is in a healthy condition and unemployment is practically nil. Moreover, the Saar is immune from the penalties imposed by the Allies on Germany proper. Consequently the Saar miners are in no way contributing toward German reparations and the finances of the district are in an extremely healthy condition. Likewise the Saar coal industry has, so far, escaped the trade and industrial depression of Britain, America and the rest of the world; it is quite content to be left as it is and conduct its financial transactions under French authority through the medium of the franc.

The transference of the Saar coal-mining industry from Germany to the control of the League of Nations was brought about chiefly through the representations of France, who urged that the wanton destruction by Germany of the great coal fields around Lens and the other northern districts entitled her to reparation in kind. Before the war France was compelled to import coal to satisfy her home requirements, and the destruction of her important coal areas involved, judging by pre-war needs, a loss of around 40 per cent of her total output. In fact so convincing was the French argument at the Versailles Conference that had she substantiated a claim for sovereignty over the Saar Basin this important area would undoubtedly have been turned completely over to France.

The normal industrial conditions in France do not warrant the employment of the total possible output of the Saar Basin. This area covers about forty large mines, and it is estimated that the seams hold now about three billion tons of coal. The Saar industries consumed only 30 per cent of the pre-war output so that a very large quantity was available for export. Of the total exportable surplus of 10,000,000 tons, 2,000,000 tons went to France, 1,000,000 to various destinations in Europe, and the balance to Germany.

The French Administration has endeavored to counteract the effect of the depreciation of the mark by procuring for Saar coal favorable railway rates. To some extent this has been successful. The establishment of publicity bureaus in various industrial centers also has aided.

Fewer Mining Accidents in Great Britain, But U. S. Ratio to Output Is Lower

Coal mines of Great Britain employ about a million men each year, or approximately one-third more than the number employed in the United States, according to W. W. Adams, statistician of the U. S. Bureau of Mines. The yearly output of coal is around 300,000,000 tons, less than half the production in the United States. Fatal accidents vary in number from 1,100 to 1,200 per year; in 1920, the latest year available, the number was 1,103. In the United States the fatalities vary from 2,000 to 2,500 per year. In a day's work the British miner produces less than one-third as much coal as the quantity produced by the American miner in the same length of time.

Differences of conditions in the two countries make it difficult to compare the frequency of mine accidents, but accepting the record as it stands, the British accident rate for every 1,000 men employed varies from 1 to 1.30, while in the United States it is from 3.90 to 4.60 each year. The relative number of accidents due to any given cause in the mines of Great Britain is not materially different from that in the United States; that is to say, about half of all fatal accidents in the British mines result from falls of roof, just as in this country. The accident rate, however, in relation to the number of men employed is consistently below the rate in the United States. In Great Britain three miners produce no more coal in a day than one in this country.

It would be difficult to account completely for the lower rate in the British mines, but among the factors to which the lower rate may doubtless be partly attributed are the experience possessed by the miners in Great Britain, many of the men having been bred to the occupation through several generations; the slower speed with which the men work as indicated by the smaller daily output per man; the use of a common language so that safety instructions may be understood; the less extensive use of machinery, only about 13 per cent of the British coal being undercut by machines as compared with over 50 per cent of the bituminous coal produced in this country; greater caution in timbering at the face, and shale dusting of the mines to reduce the probability of explosions. In Great Britain the use of shale dust is required by law.

Shortage of Shipping Facilities Now Chief Factor in Russian Coal Situation

RUSSIA'S chief source of coal always has been the Donetz Basin, which lies just north of the northeastern projection of the Azov Sea. It is situated in the immediate vicinity of the rich iron ore mines of Krivoi-Rog and also happens to be the only source of production, in all Russia, of metallurgical coke. It has large deposits of anthracite, the output of which in 1913 formed 18.9 per cent of its total production and, according to *Commerce Reports* (issued by the U. S. Department of Commerce), was rapidly mounting from year to year.

Next in importance are the mines of the Ural, which likewise produce a small quantity of anthracite, and the Moscow Basin, which, although centrally located, produces only lignite. Mining of the extensive and easily accessible deposits of black coal of the Kuznetsky Basin and Tsheremkovo, in western Siberia, was only begun, more or less intensively, after the outbreak of the war. Of minor importance are the Turkestan fields and those of Borovichi, in the Novgorod Province, where low-grade soft coal is produced.

In 1919 the total production of coal in Russia was 23 per cent of that of 1916, and in 1920 the proportion was 20.5 per cent. The comparison of the 1920 output of the principal mining districts with the output for 1916 shows the lowest ratio, 16 per cent, for the Donetz Basin. The Ural mines came to 62 per cent of their 1916 yield, Siberia gave 63 per cent, Turkestan 82 per cent, and the Moscow district 87 per cent.

According to Bolshevik official periodicals the comparatively high level of output maintained by the Ural district under the present régime is accounted for by the fact that the Tshelyabinsk lignite mines, at present furnishing over one-half of all the Ural coal, consist principally of surface layers, averaging 28 ft. in thickness, and these are being stripped without any attempt at conservation.

In the Moscow region the coal is found in pockets, and the mining industry is scattered among a large number of small concerns, with more or less primitive equipment. The work of these small plants was not affected by the industrial revolution to as great an extent as mines worked on modern intensive lines.

From 86 per cent of Russia's total output in 1914, the Donetz output dropped to 75 per cent in 1918, 64 per cent in 1919, and 55 per cent in 1920. In the first nine months of 1921 its output averaged 60 per cent of the total. The variations of the Donetz output are traced in the appended chart. The figures in the chart represent gross production, from which the consumption of the mines themselves must be deducted. Production figures are shown in millions of poods (62 poods = 1 gross ton).

Soviet Restores Unified Administration

In July, 1921, a marked change in methods was resorted to by the Soviet Government. Although but few mines were restored to private exploitation, a system of centralized and unified administration was restored in the nationalized mines, with unlimited authority placed in the hands of the chief administrator. The managerial staff and the experts were afforded a liberal remuneration for their services and a proportionate bonus on the tonnage output. Above all, the system of equalized wage payment, in the form chiefly of uniform rations, was discarded and a graduated system of direct output pay, on a sliding scale, introduced in its stead for all hands. The effect of the new

COAL PRODUCTION IN THE DONETZ BASIN

economic system was important and is worthy of some detail, as shown in the following table:

PRODUCTION OF COAL IN DONETZ BASIN AND NUMBER OF LABORERS EMPLOYED IN MINES, JULY-DECEMBER, 1921.

Months	Production in thousands of poods.(a) Black coal	Anthracite	Total	Net	Men employed Hewers	Total
July	9,600	(a)	9,600	500	(b)	107,500
August	9,300	2,000	11,300	3,290	9,000	107,140
September	15,280	3,100	18,380	9,910	9,340	93,640
October	25,600	9,400	35,000	24,700	11,700	97,200
November	29,500	13,500	43,000	24,600	12,900	106,000
December	35,920	17,130	53,050	34,050	14,660	116,300

(a) Sixty-two poods = 1 gross ton. (b) Not reported.

A decline in output, however, occurred in January, the gross production, which had been 53,000,000 poods in December, falling to 38,000,000 poods.

The increase in the production of anthracite during the latter part of 1921 is noteworthy. It formed about 32 per cent of the December production. The percentage of anthracite output to the total coal production of the Donetz Basin during the latter part of the year was: August, 18 per cent; September, 18 per cent; October, 28 per cent; November, 31 per cent; December, 32 per cent.

Additional light is thrown on the above figures of the net output by the fact that 700 coal pits were worked in July, while in November the production was concentrated in 281 pits, with 49 more pits slated for shutdown as soon as available supplies were exhausted. This concentration of work in the best equipped pits was dictated not alone by the scarcity of skilled labor but by the acute shortage of mine props and beams, coal-cutting machines, electric armatures and steel.

Output Per Man Still Below Pre-war Level

The per capita productivity of labor in general, both surface and underground, while greatly increased under the stimulus of the output pay (from 81 poods per month in July to 450 poods in November), still runs far below the pre-war level of 750 poods per month. The proportion of coal hewers to the total personnel was 25 per cent before the war. It was only 8 per cent in August, 1921, but rose to 12 per cent in November.

An important factor in the coal situation at present is the shortage of shipping facilities. Coal is piling up in the Donetz Basin—only 13,700,000 poods were shipped out in October, the November shipments were 16,000,000 poods, and the December shipments about the same. The stocks on hand on Dec. 1, 1921, amounted to 78,600,000 poods—23,400,000 poods of bituminous coal and 55,200,000 poods of anthracite. On Jan. 1, 1922, stocks on hand were 98,200,000 poods—33,100,000 poods of soft coal and 65,100,000 poods of anthracite.

The total output of coal from the Russian fields increased from 1,947,000,000 poods in 1914 to 2,101,000,000 in 1916, since which time, however, there has been a steady decline.

TOTAL PRODUCTION OF RUSSIAN COAL FIELDS

(Millions of Poods)

Districts	1914	1916	1917	1918	1919	1920	First Nine Months of 1921
Donetz Basin	1,684	1,752	1,516	537	325	278	196.8
Ural district	84	92	98	37	44	57	45.12
Moscow district	18	42	45	23	22	37	31.18
Turkestan and Caucasus	13	15	13	6	11	10	(a)4.67
Borovichi	....	....	....	....	....	2	0.67
Eastern Siberia	88	118	113	53	33	30	....
Western Siberia	60	82	94	56	51	52	49.8
Totals	(b)1,947	2,101	1,879	712	486	(c)466	328.24

(a) January to October, inclusive.
(b) Exclusive of Dombrova (Poland) mines, lost by Russia in 1914.
(c) The total for 1920 was reported to mining conference at under 431,700,000 poods (Economic Life No. 287, 1920.

Total production during the first quarter of 1921 was 114,900,000 poods and rose to 141,300,000 poods during the second quarter; in the third quarter, however, the production fell to 72,000,000 poods. The output of the Donetz Basin was principally responsible for this heavy fluctuation, rising from 72,000,000 poods in the first quarter to 85,000,000 poods in the second quarter and declining to 39,000,000 poods in the third quarter.

Owing principally to lack of transport, the stocks of coal in the Donetz Basin were accumulating rapidly—from 790,000 long tons in October, 1921, to 2,000,000 tons on April 1, 1922, representing between 200 and 300 per cent of monthly output as against 10 to 15 per cent in pre-war times. The average monthly output from the Basin for the first quarter was 642,000 tons, as against 855,000 tons in December, and a monthly average in 1916 of 2,355,000 tons. Because of the scarcity of bread, miners were leaving the district. The number of men employed in state-worked mines declined from 118,690 in January (including 14,980 coal hewers) to 94,460 in March (including 10,442 hewers).

Production has been fluctuating from month to month, but on the whole the output of state-worked mines has been receding from the high-water mark set in December, 1921—855,000 gross tons. In May the smaller leased outfits passed under control of the Central Coal Administration of the Donetz Basin.

The total gross production at the state mines of the Donetz for the first seven months of 1922 was as follows: January, 645,160 tons; February, 653,230 tons; March, 637,100 tons; April, 424,190 tons; May, 443,550 tons; June, 512,900 tons; and July, 361,400 tons.

The steady decline in the output of coal is attributed chiefly to the exhaustion of funds and supplies in kind for payment of wages, and consequent migration of skilled labor. The proportion of skilled coal breakers to the rest of the man power in the Donetz Basin declined from 13 per cent of the total number of mine workers in January, 1922, to 9.7 per cent in June, last.

How Many Working Days in a Year?

OF THE 365 days in the year, 52 are Sundays and 7 usually are celebrated as holidays. This leaves a working year of approximately 306 days. The average number of days per year worked in the anthracite collieries during the past ten years amounted, however, to only 260. Thus, out of the possible working time, an average of 46 days annually were lost. A report on idle time prepared by one of the coal companies as the result of study of this problem in its own collieries in the Southern field is pertinent.

During the year 1921 a total of 31½ days were lost, exclusive of Sundays. This lost time is accounted for as follows: The colliery was closed on 7 national holidays; there were 10 days of religious celebrations at various times throughout the year; April 1 is a holiday among the United Mine Workers generally, in commemoration of the granting of the eight-hour day in the soft-coal region. Mitchell Day, Oct. 29, also is celebrated by the mine workers as a holiday. Strikes closed the collieries on two days, due in one case to the appearance of non-union workers in the mines and in the other case to a complaint against retail prices charged employees for their coal. A further loss of 3½ days was occasioned by miscellaneous causes, namely, a snowstorm, a Russian and Polish picnic, Old Home Week celebration, and Election Day. Out of the 31½ days lost, the remaining 7 days of suspension were due to market conditions.

Saints' days and holidays generally mean two days' absence instead of one for foreign workers, according to those familiar with the habits of the people, as such times are occasions for long celebration and feasting. Often, also, the work of the collieries has been crippled to the extent of a day's shutdown when the entire mining force has quit work to attend the funeral of a fellow worker. So many times did this happen at one colliery that an agreement with the grievance committee of the mine workers was reached whereby a delegation was to be sent from the colliery at the expense of the company while the other employees remained at work. In another instance the company paid $150 additional compensation to deceased miners' families in lieu of attendance of former co-workers at the funeral.

COAL AGE INDEX

The indexes to COAL AGE are furnished free to all who ask for them. The index for the last half of 1922 will soon be ready for distribution. A copy can be had by addressing a postcard to the subscription department of COAL AGE.

Coal Commission Plans Study of Coal Storage; Believes Mine Storage Advantageous

By Paul Wooton
Washington Correspondent of *Coal Age*

The President's Coal Commission may take credit for a great diplomatic victory. At the New York meeting the operators and the mine workers, in agreeing to maintain the status quo for one year, did exactly what the commission requested them to do, although it has been revealed since that the commission was prepared to advocate an extension of the existing agreement for two years. Chairman Hammond explained that the commission, on considering all phases of the situation, had reached the conclusion that a two-year agreement would be better than one, since it would allow time for Congress to translate into legislation any recommendations that the commission might make before it would be necessary to reopen wage negotiations. Since only a one-year agreement has been reached, the commission will try to speed up its work so as to have its conclusions in final form at an earlier date than had been expected, thereby making available its recommendation in time for public opinion to crystallize and still give Congress an opportunity to act before April 1, 1924.

Some may contend that the commission in interposing itself into the wage negotiations was playing with fire, but that it had the good fortune to escape burning. Whether or not it simply is a matter of good fortune, it is evident that the public gives the commission credit for having prevented a strike on April 1 and the joint conference of mine workers and operators in its communication sent to the President, the Attorney General and to the commission declared that the action was taken upon the "urge" of the commission.

Had the operators or the mine workers been disposed to do so, they could not have been blamed had they called on the commission for advice as to the legality of an agreement. Other questions might have occurred to them which well might have resulted in an embarrassing situation for the commission. By sheer good fortune this did not happen, and as a result the Coal Commission suddenly has attained an enviable standing in the public esteem. This prestige is expected to increase greatly its power for usefulness.

While some embarrassment might have been entailed in ruling concretely on the legality of such an agreement, it is apparent that the commission regards such an agreement as was reached in New York as violative of the Sherman law in no particular. Had the commission entertained any such doubt, it would not have urged the conferees to reach an agreement. At any rate, Chairman Hammond believes that any danger of indictment is precluded by the fact that the action was taken at the direct request of the commission. In that connection, however, he called attention to the fact that the commission has no power to set aside a law or to give anyone an immunity bath.

The commission seems to have been able to discard the Jonah which has so persistently followed others who have attempted coal mediation. The late F. S. Peabody and the late Franklin K. Lane, flushed with what they thought was a wonderful achievement, were spectacularly humiliated by the war administration in their efforts to compose a bad situation in coal. Fuel Administrator Garfield became the goat of the combination of adverse circumstances.

The Federal Trade Commission tried taking a hand in coal affairs and became involved in a famous quarrel, resulting in its powers being denied by the courts. The Robinson commission gave a big increase in wages to the miners and was grilled by the operators and even by the mine workers. Vacation strikes followed the anthracite ruling in 1920.

Secretary Hoover negotiated a voluntary agreement, without powers or money, which saved the consumers of coal many millions. As a result, he was assailed as abetting profiteers and did not even have the satisfaction of receiving a single expression of thanks from the consumers, whom he benefited so greatly. Fuel Distributor Spencer was criticized bitterly because he could not repeat the miracle of the loaves and the fishes and make twenty cars of coal out of one. The Interstate Commerce Commission has had troubles galore as a result of its priority orders.

In spite of the bad luck which has pursued everyone who has touched coal, it has remained for John Hays Hammond and his associates, all but two of whom are admittedly amateurs so far as any highly specialized knowledge of the coal industry goes, to draw commendations where equally earnest efforts before have drawn only criticism. In discussing the situation after the New York agreement, Chairman Hammond said that one of the immediate results in the public interest would be a decline in coal prices. Had uncertainty as to the outcome of the negotiations continued until in March, much higher prices would have prevailed, he believes.

Mr. Hammond made it clear that the commission is of the opinion that the railroads could contribute greatly to the public good by storing the maximum possible proportion of their requirements during the period of open-top car surplus. From the trend of his remarks, it is apparent that the commission has little patience with the practice of the railroads in commandeering coal. Apparently the commission has in mind a recommendation that no coal be commandeered without permission of the Interstate Commerce Commission, and even then settlement must be made upon the basis of damage done the consignee, when such damage follows confiscation.

Would Encourage Tidewater Movement

Mr. Hammond's remarks also indicate that the commission is attaching great importance to the whole matter of storage, including certain limited storage at the mine, which will give greater flexibility to operation. Another remedial proposition to which the commission attaches importance was revealed to be special inducements to encourage tidewater movement during the period of car plenitude.

The commission had planned to begin public hearings during the latter part of January. It has been found in the informal conference, however, that much more progress is made when the commission has facts at hand with which to check expression made to it by those appearing. For that reason public hearings will be delayed until the fact-finding activities have progressed further. This will tend to prevent speculation on the part of witnesses and will furnish a concrete basis for expressions of opinion.

Among the things which the commission has in mind for early study is the matter of absenteeism, the check-off and the relative advantages and disadvantages of unionized and open-shop operation of mines. More attention now is to be turned to the anthracite situation. Before the time comes for signing the new agreement in the anthracite field, Mr. Hammond promises complete data for the guidance of the conferees. Among the things which the commission expects to study exhaustively is the matter of royalty charges on anthracite lands.

The commission has no intention of considering the advisability of prohibiting anthracite exports. It regards this as falling squarely within the jurisdiction of the Federal Fuel Distributor. In that connection it may be mentioned that the agitation in Congress on the part of certain New England legislators for the cutting off of anthracite shipments to Canada is getting nowhere. An effort to obtain even a committee hearing on the subject has been denied. If the anthracite exported, Secretary Hoover points out, were translated into the power it represents, it would be found that Canada is giving us as much electric power as is represented by anthracite exports. In addition, the Northwest uses some British Columbia coal.

Form Coal Mining Institute at Johnstown To Prevent Mine Accidents

With the primary object of accident prevention in coal mines, nineteen leading coal operators and others interested in accident prevention met in Johnstown, Pa., last week and formed an organization to be known as the Pennsylvania Coal Mining Institute of Johnstown. The institute promises to develop into an important factor in the industrial activities of central Pennsylvania.

D. L. Boyle, general superintendent of the Penelec mines, was elected president; W. A. Swift, of the coal-mine section of the Pennsylvania compensation rating and inspection bureau, vice-president; William Fleming, mine foreman for the Tunnelton Coal Co., of Ferndale, secretary, and Vincent Stanton, of the Mine Safety Appliance Co., of Pittsburgh, treasurer.

Following the election, President Boyle appointed the following committee as a board of directors: Charles Frederick, Pat Fraer, Vincent Stanton, W. E. Martin, J. G. Jones, John Reed, James T. Gatehouse and Ray Joseph. A constitution and by-laws will be formulated by the following committee appointed by President Boyle: J. G. Jones, John Reed, Pat Fraer, Charles Frederick, Vincent Stanton, William Fleming, T. J. Davies, W. A. Swift and D. L. Boyle. It was decided that the nineteen men present be recorded as the charter members of the institute, as well as those who attend the second meeting, which will be held in Johnstown on Feb. 16. With no like institution nearer the central Pennsylvania field than Pittsburgh, the organizers look for big things through the new organization.

Pennsylvania Coal & Coke Corporation to Distribute 40-Per Cent Stock Dividend

A 40-per cent stock dividend was declared Jan. 26 by directors of the Pennsylvania Coal & Coke Corporation, payable to holders of record Feb. 3, 1923. The par value of the stock remains as at present, $50 a share. In addition, the board declared a cash dividend of $1 a share, payable Feb. 10, 1923, to stock of record Feb. 3. The cash dividend will be paid upon both the present and outstanding capital stock and on the additional stock to be issued as a stock dividend.

Several changes in the personnel of the company also were announced. John H. Lang and C. H. Memory resigned from the board, and Fairfax S. Landstreet, Joseph P. Ripley, George H. Walker and C. Law Watkins were added to the board. Fairfax S. Landstreet was elected chairman of directors. Messrs. Landstreet, Walker, Watkins and J. W. Searles were chosen for the executive committee.

Explosives Sales, January-November, 1922 Exceed Those of Preceding Year

Sales of explosives in the United States during November, reported to the U. S. Bureau of Mines by manufacturers representing about 90 per cent of the industry, amounted to 715,144 kegs of black blasting powder, 4,615,944 lb. of permissible explosives, and 17,574,902 lb. of other high explosives.

Sales of black powder represent a gain of 36 per cent over the record for November last year. During the eleven months from January to November, inclusive, 5,440,487 kegs of black powder were sold for use in the United States. This was practically the same as the quantity sold during the first eleven months of 1921, but it represents a loss of 45 per cent from the corresponding months of 1920. The coal-mining industry used 84.6 per cent of the black powder sold during the eleven-month period of 1922.

Sales of "permissibles" represented an increase of 42 per cent over November, 1921. The total quantity sold during the first eleven months was 34,404 321 lb., an increase of about 2 per cent over the corresponding months of 1921 and a reduction of 30 per cent from the eleven-month period of 1920.

The November sales of high explosives other than "permissibles" were 49 per cent more than the sales reported for November last year. During the first eleven months of 1922 sales of high explosives totaled 166,090,464 lb., an increase of 18 per cent from the eleven-month record for 1921, but a reduction of 16 per cent from the corresponding months of 1920. Coal-mining operations used 11.5 per cent of the high explosives sold from January to November, 1922.

Lists State Laws on Coal-Cutting Machines

Coal-cutting machines, according to a recent tabulation of the U. S. Bureau of Mines, are in use in 3,895 mines in the United States. These mines have in use 20,034 machines, 17,875 being operated by electric motors and the remainder by compressed-air motors. On account of the wide use of coal-cutting machines, many states have issued regulations as to their operation and as to safety precautions that should be observed, especially in gaseous mines. A compilation of rules and regulations issued by different states covering coal-cutting machines or trailing cables used with them is given in Serial 2419, "Regulations Safeguarding Coal-Cutting Machines," which may be obtained from the U. S. Bureau of Mines, Washington, D. C.

Retail Food Prices Up 1 Per Cent

There was an increase of 1 per cent in the retail cost of food to the average family in December as compared with November, according to the retail food index issued by the U. S. Department of Labor, through the Bureau of Labor Statistics. The index numbers based on 1913 as 100, were 145 in November, and 147 in December, 1922.

During the month from Nov. 15, 1922, to Dec. 15, 1922, 19 articles on which monthly prices are obtained decreased in price, while eighteen articles increased in price.

For the year period Dec. 15, 1921, to Dec. 15, 1922, the decrease in all articles of food combined was 2 per cent. For the 9-year period Dec. 15, 1913, to Dec. 15, 1922, the increase in all articles of food combined was 41 per cent.

Between Nov. 15, 1922, and Dec. 15, 1922, the average family expenditure for food increased in 41 cities. In eight cities there were decreases, while two cities showed no change over the preceding month.

For the year period Dec. 15, 1921, to Dec. 15, 1922, 44 of the 51 cities showed decreases. There was an increase shown in 7 cities.

Class 1 Railroads Consume 9,260,000 Tons Of Coal in October, at $4.27 per Ton

Class 1 railroads consumed 9,260,000 net tons of coal during October, 1922, as charged to account 394, compared with 8,654,000 tons in October last year, according to a report of the Bureau of Statistics of the Interstate Commerce Commission covering 177 steam roads. For the first ten months of 1922 these roads consumed 76,036,000 tons as compared with 75,873,000 tons during the corresponding period in 1921.

The delivered cost per ton in October was $4.27 or 56c. above that for October, 1921. The per-ton cost for the year to Oct. 31, however, was only $3.98, as compared with $4.19 during the corresponding period of 1921.

Fuel-oil consumption continues to gain. During October 154,638,000 gallons were used, as compared with 133,310,000 gallons in October, 1921. The figures for the first ten months of 1922 and of 1921 were 1,251,925,000 and 1,176,-251,000 gallons respectively.

GREAT THINGS ARE EXPECTED when farmers and labor unions get together. (The accent goes on "when.")—*Philadelphia Evening Public Ledger.*

THE NEXT THING these union leaders will be doing is pointing to the dictionary to prove that wages must be hire. —*Manila Bulletin.*

Ellis Searlés Attacks Mine-Nationalization Plan as Work of "Greenwich Village Coal Miners"

Charging that "Greenwich Village coal miners" were largely responsible for the so-called nationalization plan recently published in pamphlet form by a committee of the United Mine Workers headed by John Brophy, Ellis Searles, editor of the *United Mine Workers' Journal,* issued a statement on Monday, Jan. 29, asserting that the plan was not the plan of the organization but merely the views of the members of the committee. The committee, according to Mr. Searles, was appointed to submit a report to the convention of the United Mine Workers next January. Instead of doing so, the plan was made public prematurely, he declared, at a meeting of radicals in New York City, and published as a booklet entitled "How to Run Coal."

Following the issuance of Mr. Searles' statement, C. J. Golden, of Shamokin, Pa., president of District No. 9 of the United Mine Workers of America, a member of the committee, made public a statement defending the report and at the same time gave out for publication a letter dated Jan. 27, addressed to John L. Lewis, International president of the miners' union, in which he says he was surprised when informed that it was not within the duties of the Nationalization Research Committee to give publicity to the findings of that body and also resigns as a member of that committee.

Mr. Searles' statement which resulted in the controversy follows:

"There appears to be a misunderstanding on the part of newspapers and the public in regard to the plan for the nationalization of coal mines, which was announced at a recent meeting held in New York. Apparently there is a general understanding that the plan is, in fact, the plan of the United Mine Workers of America. This is not correct. The plan as set forth at that meeting by a committee of the miners' union is the plan only of the members of that committee. The report of the committee has not yet been presented to the national convention of the United Mine Workers of America for consideration. What action the convention next January may take on the subject is, of course, unknown. The national convention held in 1921 adopted a resolution indorsing the principle of nationalization of mines and created a committee to study the question with a view to the preparation of a practical and workable plan. But the convention did not commit the union to any particular form or plan of nationalization.

Says Plan Was Proposed at Meeting of Radicals

"Unfortunately, the plan proposed by the committee was prematurely made public at a radical meeting in New York, and this fact has caused the public to believe that the United Mine Workers of America is committed to the particular plan set out in the report. The fact is the outline submitted by the committee was merely a tentative proposition and the committee has not claimed that it is a definite declaration by the union. We are informed that it was, in part, prepared for the committee by some well-known New York radicals who have no connection whatever with the coal-mining industry. While the report may, perhaps, represent the views of these Greenwich Village coal miners, the public should not accept it as a proposal of the United Mine Workers of America unless and until it has been officially affirmed and adopted by the national convention which will be held next January."

Defending the action of the committee in making public the report of the committee, Mr. Golden reported that the "Greenwich Village reds are the same people" who are the "most progressive friends the United Mine Workers have." Mr. Golden, in his statement, says in part:

"I have read the attack by Mr. Searles in which he openly condemns the League for Industrial Democracy, the Nationalization Research Committee and the proposed plan for nationalization of the coal mines made public by the committee as a basis of intelligent discussion.

"Mr. Searles is not a member of the United Mine Workers, knows practically nothing about the mining industry, has not the least conception of what the miners of the country want. He does not remember that four years ago by unanimous vote in the Mine Workers' convention the officers of the Mine Workers were instructed to draft a bill and present it to the United States Congress demanding public ownership of the mines.

"The people of whom he speaks as Greenwich Village reds are the same people who are doing and have done so much for the striking miners throughout our jurisdiction and the most progressive friends the United Mine Workers have.

"It is my opinion by the next convention the United Mine Workers will have smoked out all of the weaklings who have been voting year after year for the idea of nationalization and have no intention of carrying it out to its logical conclusion.

"There is no doubt in my mind that Mr. Searles will get the unanimous applause of the coal operators of the United States and the coal operators should feel proud that they have a champion at the head of the *United Mine Workers' Journal.*"

Mr. Golden's letter to Mr. Lewis says that he was glad to receive his appointment to the Nationalization Research Committee "because your instructions, as I understood them, were entirely in accord with my views as to what this committee ought to do."

After quoting from Mr. Lewis' letter dated Oct. 7, 1921, that "the duties of your committee will be to carry out the instructions of the International convention with reference to this subject matter and to familiarize yourself with the various phases of the problem as they may be encountered, with a view of formulating a detailed practical policy to bring about the nationalization of the coal mines and to aid in the dissemination of information among *our members* and the *public* and the crystallization of sentiment for the attainment of such end," Mr. Golden continues:

Actions Based on Instructions, Says Golden

"Since the receipt of your letter in October, 1921, I have, in co-operation with the other members of the committee, proceeded, upon the basis of these instructions, to carry out the instructions on the subject matter and familiarize myself with various phases of the problem as they may be encountered, with a view to formulating a detailed practical policy to bring about nationalization of the coal mines and to aid in the dissemination of information among our members and the public and the crystallization of sentiment for the attainment of such end.

"Consequently I was very much surprised when, during a recent conference between the International officers and the Nationalization Research Committee, you informed us that in your opinion it was not within the duties of the Nationalization Research Committee to give publicity to the findings of that committee, either within or without the organization, until such findings had been presented to the International convention, even denying the use of the *United Mine Workers' Journal* that we might at least keep the rank and file of our organization in touch with the work of committee.

"I regret very much that this interpretation of your instructions to the committee should come so late—after the committee off and on for the past fifteen months of research work had given the widest publicity upon the understanding stated. Had I understood your letter to mean that membership on the Nationalization Research Committee precluded all discussion or public statements concerning the subject of its research until such time as it could report to a convention, I could not possibly have accepted your appointment. My interest in the subject of nationalization of the coal mines is so keen, my feeling in the matter so deep that

I want every member of the organization to think about it and I want to keep it constantly in the public mind.

"Not only would it be impossible for me to serve in this limited capacity but I find it undesirable to go on under these hamstrung and censored conditions until the convening of the International convention in January, 1924. The only course open to me, therefore, is to tender my resignation from membership upon the Nationalization Research Committee, effective immediately. I am very sorry that this difference of opinion has compelled me to take such action and trust that conduct of the work of the committee to date in no way embarrassed the organization."

Heber Blankenhorn, of the Bureau of Industrial Research, defended the part taken by that organization in the work of the committee by saying that the members of the Bureau of Industrial Research, when requested, were quite willing to furnish to the Nationalization Research Committee of the United Mine Workers such data and analyses as were necessstry for any scientific approach to the problems of a nationalization policy. The committee availed itself of data from other research organizations and from government officials and altogether went at their task in a manner which any open-minded man should applaud.

The committee's requests were informal, Mr. Blankenhorn said, and the data were given, of course, without payment. Likewise informal, he said, were the requests made by officials of the Mine Workers to members of the Bureau last summer asking that they help raise relief for needy strikers. Members of the Bureau, who believed the workers in the old non-union fields were justified in striking, co-operated, as requested, with friends and acquaintances in raising $55,000 in cash donations or loans sent to officials of the United Mine Workers for the strikers in Somerset.

Brookhart Bill Provides for Government Operation of Mines in Emergency

A bill providing for government operation of coal mines during any period of emergency has been introduced in the Senate by Senator Brookhart, of Iowa. The bill authorizes the President to declare when an emergency exists and "to take over the possession, use, control and operation of any mine for such emergency period." The bill goes into some detail as to how "just compensation" is to be awarded the owner and provides penalties for any operator who obstructs inspection of the property or the record or mishandles funds during the period of federal control. Opinion at the Capitol is that the measure will not be taken up for serious consideration and that it has no chance of passage.

The measure provides "that whenever the President finds that an emergency exists because the supply of coal available for national needs is so inadequate as to obstruct or threaten to obstruct the operation of the Government of the United States and of its several departments, the transportation of the mails, the operation and efficiency of the army and navy, the operation of carriers engaged in commerce among the several states and with foreign countries and the orderly flow of such commerce, he is authorized . . . to take over the possession, use, control and operation of any mine for such emergency period or part thereof as he deems advisable.

"Any operator whose mine is under federal control shall be paid from time to time a just compensation for the possession, use, control, and operation of such mine during the period such mine is under federal control, but such just compensation shall not exceed the amount of the net earnings for such period. The President shall fix or cause the commission to fix the amount of such just compensation. . . .

"The President is authorized to carry out agreements entered into prior to federal control between operators and third persons for the purchase or delivery of coal, in so far as such agreements do not unreasonably interfere with the purposes of federal control.

"In order effectually to administer the provisions of this Act, the President may (a) exercise any of the functions vested in him by this Act through such agencies as he may determine, (b) prescribe regulations and issue orders, (c) provide for the maintenance, repair, and alteration of all mines under federal control, (d) employ and fix the compensation of officers and employees necessary to operate any mine under federal control, and (e) authorize such expenditures as he deems necessary properly to exercise all such functions vested in him by this Act.

"Upon recommendation by the President, the Interstate Commerce Commission is authorized to issue such orders for embargoes and priorities in car service, and to take such other suitable measures as will facilitate the transportation and the equitable distribution of coal, and as will best meet the emergency. . . ."

Indianapolis Case Still Lies Under Dust

"There is nothing I can say in regard to the case," L. Ert Slack, Indianapolis, assistant to the Attorney General, said recently with reference to the indictments pending in the federal court against bituminous-coal operators and miners charged with conspiracy to violate the Sherman anti-trust law. Mr. Slack, who has charge of the prosecution of the case under the direction of Attorney General Harry M. Daugherty, was asked about the disposition of the cases, in view of reports from New York that operators in conference with miners have indicated that the Indiana conspiracy case stands in the way of a wage agreement affecting the Central Competitive Field. The indictments were returned by the federal grand jury in March, 1921. The case was vigorously pressed before the grand jury and later before courts in other states where removal proceedings were instituted. About a year ago when final arguments were to be made by Mr. Slack in one or two removal proceedings, he received instructions from the Attorney General to cease activity pending further directions.

Evidence collected by the government largely was in documentary form taken from proceedings of joint conferences and union conventions. At a hearing before Judge A. B. Anderson of the district court, involving the manner in which Attorney General A. Mitchell Palmer had directed the prosecution of the case, evidence was introduced to show that he had sought to delay the trial. This attitude of the Attorney General was responsible for the resignation of Dan W. Simms, of Lafayette, as an assistant district attorney having a part in the prosecution of the cases. Meanwhile the records in the case have accumulated dust in Mr. Slack's office at the Federal Building. Those who were instrumental in developing the evidence say that weeks now would be required to become acquainted again with the evidence so that it could be presented properly at a trial.

Borah Wants Judge Alschuler to Qualify

Elimination from the bill to amend the act creating the United States Coal Commission of a provision designed to permit Judge Samuel Alschuler to qualify as a member of that body is not satisfactory to Senator Borah, chairman of the Senate Committee on Education and Labor, which is handling this legislation in the upper branch of Congress.

When his attention was called to the fact that the House Committee on Interstate and Foreign Commerce had reported the bill with this provision stricken out, Senator Borah declared that he would use his "full influence" with the members of the Senate committee to have it restored.

"All the information I have received indicates that Judge Alschuler is one of the most valuable members of the commission," Senator Borah said. "He has had several months' experience with the commission's work, and to force him to retire at this stage of the proceedings would be wasteful indeed. I do not agree with the expressed views of some members of the House committee that a federal judge should not be a member of this commission."

The bill is on the unanimous consent calender of the House and probably will be reached in its order by Feb. 14. Chairman Winslow, of the House Interstate Commerce Committee, stated that if indications are that the measure cannot be reached by that date he will ask for a special rule for consideration out of order.

Joint Conference Letter to President Reaffirms Wage-Scale Contracts

Following the joint conference between operators from Illinois, Indiana and eastern Ohio and the United Mine Workers in New York, Jan. 18-23, 1923, the following letter, dated New York, Jan. 24, was sent to the U. S. Coal Commission at Washington:

"Acting upon the urge of the United States Coal Commission advanced in the interest of the common welfare as set forth in a message dated Jan. 4, 1923, and addressed by the commission 'to the Operators and Miners Committee on Reorganization,' then meeting in Chicago, Ill. . . . This Joint Conference of miners and operators of Illinois, Indiana and Ohio, as now constituted, hereby reaffirms the wage-scale contracts now existing between the United Mine Workers of America and the coal operators whose interests are represented in this conference, and hereby extends the same for a period of one year from April 1, 1923, in all of their terms, provisions and conditions, and directs the chairman of this joint conference to mail a copy of this resolution to the President of the United States, to the Attorney General and to the United States Coal Commission, that these public authorities may be duly apprised of this action.

For the Operators:	For the Miners:

W. L. Robinson, Ass't Sec'y.	Wm. Green, Sec'y-Treas.

Alex is in Again!

It has always been bone dry in Kansas. That makes it more difficult to understand Alex Howat. Kansan though he has been for years, he's a natural-born tender of bars. He's behind 'em again! Conductor Finnegan who made that pithy and classic report to railroad headquarters has nothing on Howat. Alex, in his experiences with the prison bars of Kansas has been "Off-agin-on-agin" so many times it must be going to his head at last, case-hardened bar hound though he is.

His first case was with John L. Lewis, who kicked him out of the miners' union for calling an outlaw strike. His second case was with the Industrial Court of Kansas, which kicked him into jail for the same deed—kicked him into two jails, in fact, one after another. Last spring he walked out of the first one—Cherokee County Jail—on an appeal. He walked as far as the outer jail office, to be exact—when, whuff! Crawford County snatched him across the line into its own jail for violation of an injunction against that strike he had called. He stayed there for 266 days of his 365-day term. Then came 1923, bringing Governor Davis into the Kansas Capitol. A Davis judge released Howat on parole Jan. 20.

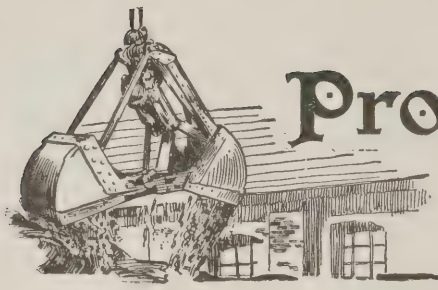
"In some ways I'm sorry to leave jail," Howat remarked as he walked out. He got clear outdoors this time. Cherokee County, with 56 days' imprisonment awaiting him, couldn't stand the thought of Alex being out in the cold that way. So it "retch out and fotch him in," as they say. On Jan. 26 a judge of the Cherokee County District Court issued a bench warrant ordering Alex into that county's jail Jan. 30 to finish his first term. So there he is.

But that isn't all. Alex still has 99 days coming to him back there in the Crawford County jail, whence he exuded on parole Jan. 20. The trouble is, the Kansas Attorney General declares the parole is not valid. Even though Governor Davis thinks the Industrial Court, which Howat offended, is nothing but a bag of gas and the law creating that court is unconstitutional, and even though the Davis-appointed judge freed Alex, the Attorney General says Alex must go back for those 99 days plus. The "plus" indicates still another term in the Crawford County jail over and above the 99 days. In the sentence which sent him to Crawford County it was provided that if Alex wasn't willing to testify before the Kansas Industrial Court when his year in jail for contempt was ended, then Alex should stay right in jail until he was willing.

And so it's "out-agin-in-agin" but not "gone agin" for Alex, the deposed president of Kansas union miners. If he goes back to Crawford County to 'tend bars there until he is willing to tell the Kansas Industrial Court about that strike—now almost forgotten—he may 'tend bars the rest of his natural life. Alex is no Barkis.

Bituminous-Coal Mines Shut Down Between Aug. 7 and Oct. 21, 1922

The extent to which bituminous-coal mines that report weekly to the Geological Survey were shut down during the last three weeks of the coal strike of 1922, and in the weeks immediately following is shown in the appended table, compiled by the U. S. Bureau of Labor Statistics from Survey records. Only commercial mines of some size are included, which in normal times represent from 55 to 60 per cent of the total mine capacity. Although the plants reporting are not completely identical each week, the figures probably present a fairly accurate picture of the trend of operating time.



WEEKLY OPERATING TIME AT CERTAIN BITUMINOUS COAL MINES, AUG. 7 TO OCT. 21, 1922.*

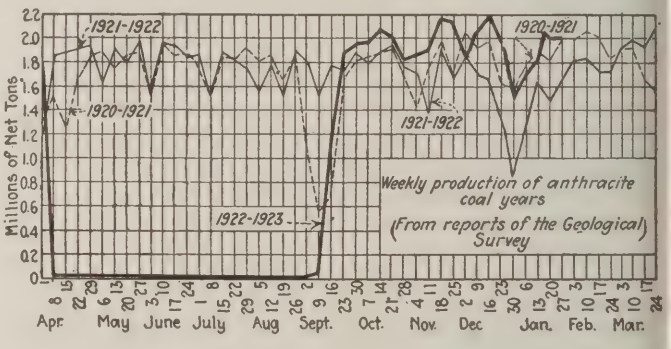
Coal Companies Oppose Control of Indian Creek & Northern by B. & O.

The Lambert Run Coal Co., the Delmar Coal Co., the Hughes Coal Co., the New Superior Coal Co. and Clarence D. Robinson have filed a petition of intervention in the matter of the application of the Baltimore & Ohio Railroad Co. for authority to acquire control of the Indian Creek & Northern Railway Co. These coal producers contend that the Baltimore & Ohio for the past several months has furnished less than 30 per cent of the total cars required by the petitioners' mines. It is pointed out that these are local mines served only by the Baltimore & Ohio R.R. If that company were allowed to acquire the Indian Creek road, on which line are mines with a potential capacity of 200 carloads of coal per day, the Baltimore & Ohio would be in a worse position to meet the requirements of the mines on its line.

Production and the Market

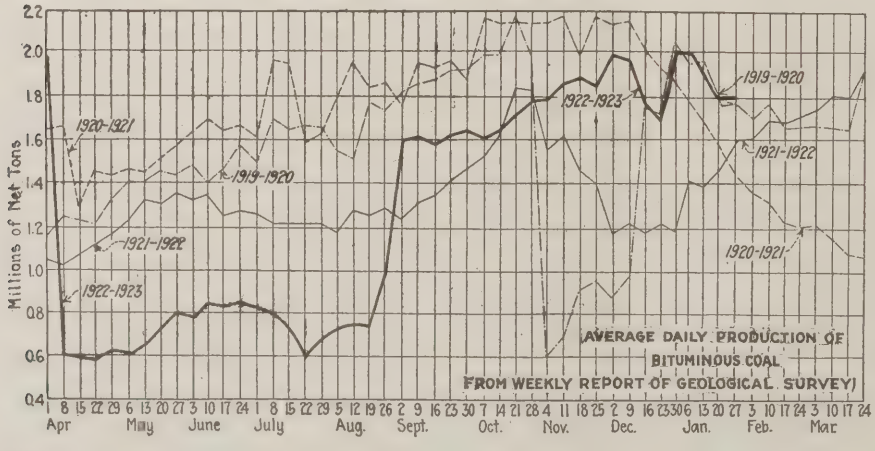
Weekly Review

Uneasiness prevails throughout the soft-coal trade. Production holds close around 11,000,000 tons per week while prices continue the downward movement. *Coal Age* Index of spot prices at the mine dropped 16 points to 342 as of Jan. 29. This corresponds to an average price of $4.14 per net ton, as compared with $4.33 a week ago.



Announcement the middle of last week that operators and the union had signed a contract to continue present wages for one year from April 1, next, had no pronounced effect on the market. This outcome of the wage negotiation had been discounted following the telegram from the Coal Commission to the convention of miners and operators in Chicago on Jan. 4. Coal buyers, particularly those for industrials, had been negotiating for several weeks for storage coal in the event that it developed that there was to be a strike next spring. These orders either have not been placed or have been cancelled in the last few days.

Soft Coal Reserves Not Unusual



Speculation on what the stock report of the government which it is expected will be released around Feb. 4 will show with respect to reserves as of Jan. 1, centers around a figure of 40,000,000 tons as the minimum. Reserves of this size are not unusual for this time of year, and any figure in excess of 40,000,000 tons will serve to explain the actual indifference of the market. Weather and irregular and fluctuating car supply are the controlling factors at this time. Locally, poor car supply on the leading roads in Pennsylvania in both the high- and low-volatile districts serve on the one hand to uphold quotations, while on the other, embargoes such as that on the New Haven against shipments for industrial use and against B. & M. and B. & A. destinations and the B. R. & P. embargo against New York Central points have knocked down the prices of central Pennsylvania grades. Congestion at Toledo and embargoes on movement into Michigan through that gateway have tended to break the market locally and south to Columbus.

Railroad buying East and West has for the past three months been on a level with consumption. Big-lot buying is slackening off by the railroads, public utilities and the large industrials. The most active buyer continues to be the retailer, who is still taking on substitutes for anthracite in the East and meeting current requirements in the West. The outlook for February is for continued production east of the Mississippi of all the coal the railroads can carry at slowly but steadily declining prices.

One sure indication of slackening of the spot market is the effort now being made by many of the producing

interests to make contracts for the next year. Some shippers are offering twelve-months contracts beginning Feb. 1 and others are contracting from April 1. Highest-grade Pennsylvania coal is being offered for delivery through the year at $4.25 per net ton at the mines. Offerings as high as this are accompanied by guaranteed price clauses which operate to give the buyer any decrease throughout the year on the same coal under similar delivery conditions. On the New York market, buyers have offered tentatively to contract at $3.50,

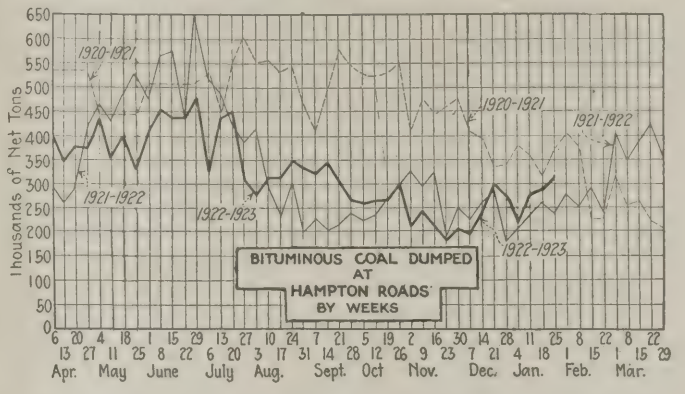
Jan. 13 (*b*)	119,000	323,000
Jan. 20 (*a*)	115,000	328,000
Calendar year	343,000	960,000



(*a*) Subject to revision. (*b*) Revised from last report

One shipper has sold his output for next year at $3.60, guaranteeing both delivery and price against wage increase. Philadelphia reports contract offerings for the next year at $3.80@$4 on the best steam coal.

Production of anthracite holds up around 2,000,000 net tons per week. Household consumers continue to insist on anthracite and this fact is making retailers generally careful in buying substitutes for fear of being caught with unsalable stock when winter breaks. The Massachusetts congressional delegation continues to urge upon Congress the policy of cutting off our Canadian neighbors from any anthracite. Canada has barely got her quota of this household fuel, but Representative Rogers and Senator Walsh appear to believe that they should not have even that. The demand for anthracite will continue strong to the end of winter.

Prices on Connellsville coke are unchanged, lack of demand on the part of the furnaces being offset by the domestic fuel demand. Buying in small lots of from one to five carloads for Canada, northern New York and Michigan has replaced the wholesale purchases of Eastern buyers that characterized December.

"For the third week in succession the production of soft coal remained stationary at about 11,000,000 tons," says the Geological Survey. "Revised estimates for the week of Jan. 20 place the total at 10,868,000 net tons.

"Preliminary reports for the present week (Jan. 22-27) indicate that loadings on Monday were less than on Monday of the week before. The rate of decline from day to day, however, was less than in that week and total

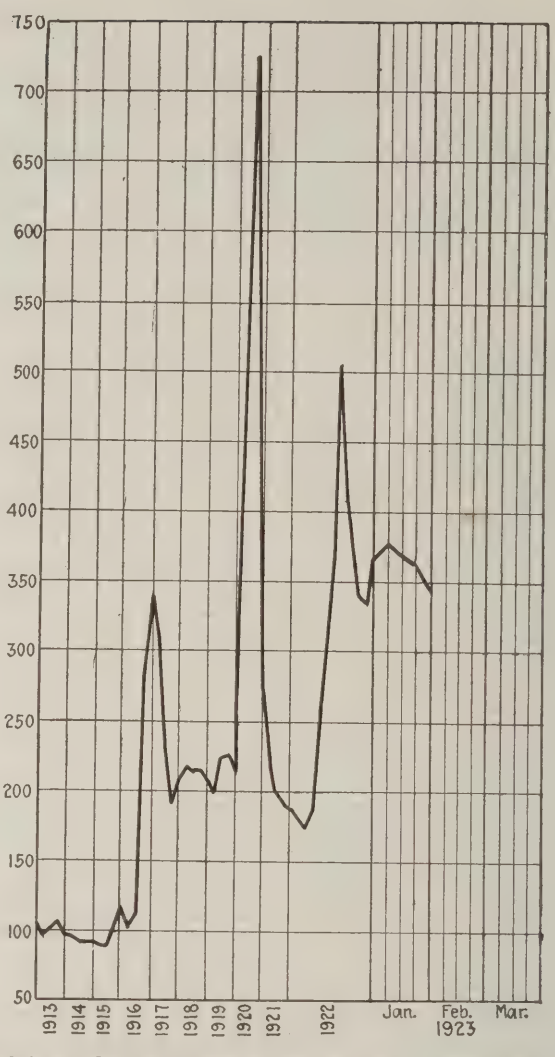
loadings for the first four days showed a slight increase. The indications are that the total output will again be in the neighborhood of 11,000,000 tons."

Mid-West Situation



Practically every Midwestern coal market is displaying identical symptoms: The bottom is sinking. A dash of colder weather during the past week with some snow had a trifling effect and weak transportation made a marked impression. Had it not been for them a sure drop in prices even on the best domestic grades would have taken effect not later than February 1. The standard price of $5.50 a ton for southern Illinois lump—the choicest domestic coal of that state—is maintained by the principal operators only because the available supply is low.

Smaller operators have undersold that price considerably to get business. Continued poor car service, due principally to the fact that railroads are not favoring coal any longer now that no emergency seems to exist, is expected to continue at least for a time. Naturally this means less steam coal on the market. Steam buyers have taken no fright at this prospect and stockers are not rushing into the market, but there is a slight firming of the steam trade. It is anticipated that screenings will not drop any lower. They are selling in southern Illinois now for $2.50@$2.75 with a few sales at $3 but in Central Illinois they have sunk to $1.50 which compares with screenings from the Standard field.

The Chicago market has seen the inflow of a good deal more Eastern coal during the past week. It has moved on the narrowest margins through jobbers' hands and has been placed with such effort that there has been no encouragement to move any larger quantity of it to that dumping ground. Eastern smokeless, whose volume reaching Chicago is still small but increasing slowly, has been selling steadily at $6 with an occasional shading under that during the last few days.

The average of two days a week in running time in the southern Illinois fields and those mining regions clustering east of St. Louis has been enough of an indication to the miners there of what they may expect during the coming three quarters of a year under the old scale of wages. A good deal of dissatisfaction is already apparent among them. Even railroad tonnage in these fields, especially from the Du Quoin and Standard districts, has fallen off thus reducing working time still further.

Standard coal, always lowest in price, has found a fair domestic demand in St. Louis at $3.50@$3.75, but no other coal has been moving easily on that market. Local retail prices in that city on domestic sizes are: Standard, $6.75; Mt. Olive, $7.50; Carterville, $9.50; byproduct coke, $12.50; smithing, $14; all sizes of anthracite, $16.25. Country demand there is weak on all fuels. Dealers are still trying to unload what they have in their yards before a big general drop occurs.

Coal Age Index 342, Week of Jan. 29, 1923. Average spot price for same period, $4.14. This diagram shows the relative, not the actual prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the U. S. weighted in accordance first with respect to the proportions each of slack, prepared tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke, 1913, 1918," published by the Geological Survey and the War Industries Board.

How the Coal Fields Are Working

* Rail and river mines combined.
† Rail mines.
(a) No report.

In Kentucky the market generally is softer. There has been some movement of domestic sizes at prices off 25 or 50 cents but all buying is in small lots. Nobody is stocking. Short car supply is having its usual effect in that region too. The Louisville & Nashville has averaged about 20 per cent and the Illinois Central in the neighborhood of 45 per cent in western Kentucky which is low enough to prevent volume from knocking prices flat. However western Kentucky lump has sunk to $3.75@$4.25, mine run to $2.25@$2.75 and screenings to $1.80@$2.25. A good deal of this coal that goes out of the state, moves on consignment hunting a buyer. Jobbers have difficulty in placing shipments until they pass all points of rail congestion. Eastern Kentucky, also with a low car supply is holding up on lump to levels above $6 but there is little call for mine run and screenings have weakened to $2.75@$3.25.

The Northwest is experiencing a noticeable softening in spots. Most of these spots are around the Head-of-the-Lakes where dock men are beginning to worry a little for fear they will not be able to dispose of their 1,750 000-ton bituminous stock by spring. Immediately upon last week's New York settlement with the union for a continuance of the present scale for another year, they started a sales campaign with price concessions of 25 and 50 cents on all

soft coals. Dock lump is selling for $9, run of pile $8.25 and screenings as low as $6. Dock operators are frank to say they must cut overhead costs during the coming year and they hope to eliminate the middleman in their effort to meet competition. It is noted in Minneapolis that rail competition is keener than ever right now. Good grade rail coal is laid down in the Twin Cities at $1@$3 less than the cost of competing coal on the docks. The freight rate of dock coal to that market is $1.85. The effect on trade is apparent.

Around the Head-of-the-Lakes it is now admitted there is enough anthracite. The wail for more of it is dying out and docks with hard coal unsold are starting to push it. Prices remain firm however. But in Milwaukee the supply is still a matter of worry. Retail sales are mostly in one-ton lots. A little is coming in by rail but the domestic demand is by no means satisfied and smokeless is not arriving in sufficient volume. Screened Pocahontas sells for $16 and mine run, $12.50. There is a brisk business in coke.

Gloom continues to spread through the coal trade in the Southwest where soft weather, constant oil competition and poor co-operation by railroads conspire to make the coal operator's life unhappy. Few mines have worked more than half time lately. Car shortage has done its bit, however, in holding prices firm. There has been no recession from the standard price of $5.50 for Kansas lump, $3.75 for mine run and $2.50 for screenings while Arkansas semi-anthracite maintains its lump price of $6@$7. Colorado and Utah markets continue weak because of soft weather. In Salt Lake City, Utah lump has dropped from $5.50 to $5.

Ohio Conditions Easier

Settlement of the wage scale controversy and the continued mild weather combined to soften the coal trade in Ohio.

Bituminous coal receipts at Cleveland during week ended January 20th decreased 303 cars under the preceding week, due principally to transportation conditions. Total receipts amounted to 2,587 cars divided 2,021 for industries and 566 to retail yards. Average weekly receipts since January 1st are 2,942 cars as compared with 2,345 cars during the last quarter of 1922.

It had been possible to increase the output of the New River field somewhat during the latter part of January owing to a larger run of cars during the earlier part of each week and on Monday, January 15 the output reached the highest level in several years, 45,000 tons being loaded that day.

Pocahontas production has been slightly increased and yet the output is not much above 225,000 tons a week. Tug River mines are also loading more coal. The output, however, is still a little less than full-time capacity.

More cars are being distributed to the mines in the Kanawha region than was true as to the early part of January and it has been possible for such mines to increase their working time. Increased production however, has been at the expense of higher price levels for with so much more fuel going to market from the Kanawha and other regions prices have been dropping and it has become exceedingly hard to keep pace with them from day to day. Mine run for western delivery now commands approximately $3 a ton, with lump ranging from $5 to $6.

It has become possible to speed up production to some extent in the Logan region where mines are now working about on a half time basis so that the output has reached about 250,000 tons a week. Such an increase has been due to better transportation facilities.

Throughout the greater part of January influenza among the miners and their families in Virginia was making inroads on production to the extent of about 7 per cent. Car shortage losses, however, affected production to the extent of nearly 40 per cent and inability to secure more empties was principally responsible for a slightly lower output. However, a heavy tonnage was being used in the production of coke which is now averaging about 17.000 tons a week in the field. A softer market had the effect of causing a slight price recession, buying being on a lighter scale.

Under the stimulus of a better car supply Northern Panhandle mines were able during the latter part of January to produce more coal and to materially increase shipments inasmuch as haulage to various markets was better. The volume of coal for Eastern markets was especially large.

Dropping prices featured market conditions in northern West Virginia as elsewhere in West Virginia during the week ending January 20 and at the outset of the following week, due to several causes. In the first place with cars more plentiful, a larger tonnage of fuel was flowing to market and in the next place consumers, particularly of steam coal, were not so strongly in the market.

Production has reached large proportions in the Upper Potomac, Georges Creek and surrounding territory, aggregating more than 110,000 tons a week which is the highest figure reached in some time.

North Atlantic Market Quiet

Spot inquiry for bituminous in New England is even less pronounced than a week ago. Buyers are more inclined to wait developments. The wage settlement at New York, and somewhat less favorable prospects for manufactured goods have together caused a marked change in the outlook for February. Port facilities at Boston are again congested, upwards of 80,000 tons having been entered at Mystic wharf alone and waiting discharge. A share of this is British coal for locomotive supply, but most of the accumulation results from increased shipments of Pocahontas and New River. Demurrage has accrued to such an extent that steam users are unwilling to make purchases except at competitive prices f.o.b. cars. On the whole the trade is apprehensive that quotations will be materially less within a reasonably short time.

Spot prices on all the Pennsylvania grades have dropped 50c. or more in consequence, and more than a few shippers are willing to accept orders on this basis for shipment when the embargoes are raised.

At Hampton Roads the available coal on cars is steadily mounting, and this applies both to Navy standard grades and those high volatiles that are shipped in anticipation of demand for railroad supply. Movement to Tidewater has shown a steady increase as compared with deliveries West, and most of the agencies agree that the trade is in for a sluggish market. Spot coal that is being urged on buyers inland from Boston has sold as low as $10 per gross ton on cars Boston, this basis comparing with $11 a fortnight ago. Notwithstanding the embargoes all-rail there has been surprisingly little inquiry for spot coal the past few days.

F.O.B. Norfolk and Newport News Pocahontas and New River have already sold down to $8 per gross ton f.o.b. vessel. Buyers are so scarce that shippers are inclined to listen to any favorable offering and a much lower level is anticipated during the current month. The slow dispatch at the loading piers ten days or so ago has now materially improved and steamship owners are again willing to make charters without guaranteed days for loading.

Anthracite Output Holds Up

"The production of anthracite in the week ended January 20 is estimated at 2,010,000 net tons including mine fuel, local sales, and washery and dredge output," by the Geological Survey. "This estimate is based on reports from the nine principal carriers, showing a total of 38,429 cars loaded. This is a decrease of 5 per cent as compared with the week preceding.

"Preliminary reports for the first half of the present week indicate a slight increase over last week and that the total production for the week will be about 2,100,000 tons."

Foreign Market And Export News

British Coal Production Registers Big Gain; Export Demand Heavy

Output of British coal during the week ended Jan. 13 was 5,605,000 tons as against 4,385,000 tons the previous week, an increase of 1,220,000 tons, according to a cable received by *Coal Age*.

There is a heavy demand for shipments to the United States and France and the ports of South Wales are crowded with ships. A number of boats are unable to finds berths.

It is estimated that approximately 300,000 tons has been sold to the United States and Canada for shipment early this year, and it is said that many inquiries have been received from the United States for steam and gas coals for shipment over the next 3 or 4 months.

The Swedish State Railways are in the market for tenders for 70,000 tons of the best steam coals for delivery into March.

If France seizes all the Ruhr coal for herself and Italy, Germany must turn to Britain to compensate herself for what she will lose.

There were 8,345,606 tons of British coal exported to Germany in 1922 as against 817,877 tons in 1921 and 13,457 tons in 1920. Last year's export nearly equaled the tonnage exported in 1913 when it was 8,952,328 tons.

French Miners Want Wage Conferences Resumed

The miners of the Nord and Pas-de-Calais have asked that the negotiations for a wage increase be resumed at once. These negotiations which were started several weeks ago were postponed until April next but the miners on account of the continued rise in the cost of living request that the demands be taken up immediately.

There has been a decrease in the demand for domestic coals. Arrears have been partly overtaken and delays of delivery do not exceed more than two or three weeks.

The demand for industrial coals remains excellent. Pithead stocks have dwindled to unimportant figures and stocks of the most merchantable sorts are almost completely wiped off.

The imports during November amounted to 1,964,940 metric tons of coal; 437,078 metric tons of coke and 179,866 metric tons of patent fuel.

The exports during the same period were 295,336 metric tons of coal, 47,442 metric tons of coke and 16,525 metric tons of patent fuel.

Germany supplied to France and Luxemburg in November and December, the following amounts of reparation fuel, in metric tons:

	France		Luxemburg	
	November	December	November	December
Coal	332,901	320,232	3,068	5,617
Coke	387,754	402,080	125,223	122,687
Lignite briquets	52,499	52,134	5,060	5,030
Totals	773,154	774,446	133,351	133,334

The December coal shipments included 33,314 tons of coking slacks.

Hampton Roads Situation Dull

Business at Hampton Roads was comparatively dull, and coastwise movements continued to slow up on account of reported surplus of stocks in the north. Supplies at this port increased to a point greater than at any time in the last three months, but car supply continued at about 35 per cent of normal.

Increase in general shipping has made bunker business fairly active, but no exports, except occasional small cargoes, have been booked. In the domestic trade, a scarcity of prepared soft coal is seen, while anthracite is practically unobtainable. Prices of Pocahontas coal have gone up to $14, and run of mines is $11, the highest figure ever reached here by these grades. The general feeling in the trade was one of optimism, and the general tone of the market was firm.

Ruhr Valley Coal Output Increased

Coal production of the Ruhr Valley amounted to 97,350,000 tons in 1922, as against 94,114,785 in 1921, an increase of 3,235,215 tons. The December output was 7,900,000 tons, a decrease of 696,214 tons from that of the previous month, due to the suppression on Dec. 18 of the extra-shift agreement. While the November production amounted to nearly 8,600,000 tons that of December inclusive of the pits on the left side of the Rhine amounted to 7,900,000 tons, at 23¼ working days.

The following table shows the total production of the last two years and that of the year 1913 in tons:

	1913	1921	1922
January	9,786,005	8,072,912	8,132,763
February	9,194,112	8,174,606	7,737,974
March	9,181,430	7,685,185	9,014,278
April	9,969,560	7,894,985	7,512,646
May	9,261,448	6,954,607	8,081,951
June	9,586,385	7,753,350	7,078,361
July	10,150,347	7,782,676	7,864,200
August	9,795,236	8,068,065	8,336,773
September	9,696,397	7,853,871	8,265,688
October	9,895,090	8,047,353	8,827,126
November	8,932,276	7,772,658	8,596,214
December	9,101,858	8,054,517	7,900,000
Whole year	114,550,153	94,114,785	97,350,000

News Items From Field and Trade

ALABAMA

The Empire By-Products Corporation, chartered under the laws of Delaware, with a capital stock of $2,000,000, will soon commence construction work on a 50-oven byproducts coke plant, near Empire, in Walker County. Approximately $1,500,000 will be spent on the construction of this plant. Mr. Moore, head of the Empire Coal Co., is largely interested in the Empire By-Products Corporation. He owns extensive coal mines and other properties in Walker County.

Alabama coal fields produced 16,630,000 tons of coal in 1922. This is an increase of 3,613,000 tons, or approximately 25 per cent over 1921, according to the Alabama Mining Institute. The largest production for any one month was during August, owing to the coal strike in other fields when consumers turned to Alabama for coal supplies. The following table gives the output in Alabama fields by months in 1921 and 1922, in tons:

	1921	1922
January	1,500,000	985,000
February	1,150,000	1,025,000
March	990,000	1,380,000
April	985,000	1,179,000
May	900,000	1,380,000
June	875,000	1,500,000
July	875,000	1,530,000
August	1,050,000	1,750,000
September	1,075,000	1,450,000
October	1,285,000	1,435,000
November	1,288,000	1,550,000
December	1,047,000	1,475,000
Totals	13,020,000	16,639,000

COLORADO

Clinton L. Oliver, of Kansas City, Mo., has just returned from Paonia, where he has arranged for the mining of coal on an 80-acre tract. Several years ago this land was regarded as valueless by Mr. Oliver's father, and the senior Oliver was seriously thinking of letting it go for taxes. Coal companies in the vicinity steadfastly refused to exploit the land. The nearest railroad was a mile away. But the younger Oliver offered his father $380 an acre for the land, a total of $30,400, which was accepted with haste. Now young Oliver estimates that he will eventually receive $1,400,000 from the investment through coal royalties. The mine will be in operation by March 1 by a syndicate of Western mining men, who, under contract, will mine daily 200 tons of coal from veins totaling about 60 ft.

Robert A. Jackson, formerly mining engineer with the Hillman Coal & Coke Co., at Jerome, Pa., is now located at Walsenburg, Colorado, with the Colorado Fuel & Iron Co.

CONNECTICUT

Thomas Russell, State Fuel Administrator, has tendered his resignation and that of Deputy Administrator Charles Jaynes, of West Hartford, to Governor Templeton. Mr. Russell in his letter said that the apparent reluctance of the State Legislature to act in the present emergency coal situation "can be due to only two reasons: (1) a belief that no emergency exists—in which case this administration is not needed by the State—or (2) the fact that the character of this administration is such as to make them timid about giving it legal authority for its action. In order to clarify the situation as regards the latter condition, I feel that it would be helpful to you to give you a free hand in building up a new organization in which the Legislature might have more confidence."

ILLINOIS

A total of 6,444,922 tons of coal was produced by the mines of St. Clair County during 1922. Six men met death during the year in the mines. The annual report shows that 60 shipping mines employed 7,653 men underground and 821 on the surface. Active operating days in the shipping mines totaled 153 in the year. The St. Louis & O'Fallon Coal Co. leads in the output by shipping mines with a total of 653,883 tons in its two Nigger Hollow mines.

Lyman Graham has retired as active head of the **McLean County Coal Co.** after 55 years of service with this company. Ill health has made this step necessary. The directors of the company were unwilling to accept his resignation as president of the company, but allowed him to retire from active service and responsibility with full salary, keeping his position as president of the company, but with another man to take active management of the plant. Mr. Graham is 78 years of age and is one of the "grand old men" of the Illinois coal trade.

James G. Monahan, of Chicago, has been named manager of the Peabody Coal Co. interests in the Springfield district and will also manage the Springfield District Coal Mining Co., as successor to the late Alfred G. Hane, who died Dec. 28, 1922. Mr. Monahan has been associated with the Peabody Coal Co. for the last six years. He was formerly in charge of the Buffalo district, spent several years in the Chicago office and also was on the road for this company for some time as a salesman. He will remove his family to Springfield and make his permanent home there.

Anton Loeffler has been named acting superintendent of the three mines of the Spring Valley Coal Co. to succeed the late William Bevan. His appointment was effective Jan. 1. He has been serving as mine boss at the No. 5 mine.

Howard A. Swallow, attorney, Danville, has been elected president of the **United Electric Coal Co.,** of that city, to succeed F. E. Butcher, resigned. Mr. Swallow has for sixteen months been vice-president. J. B. Melville, treasurer, has been elected vice-president to succeed Mr. Swallow. The complete list of officers and heads of departments of this $1,500,000 coal-producing corporation is as follows: Howard A. Swallow, president; Richard Campbell, vice-president and general counsel; J. B. Melville, vice-president and treasurer; E. H. Jobson, secretary; James Anderson, general superintendent in charge of operations; F. E. Toenniges, chief engineer; L. G. Shorthouse, auditor, and J. C. Lane, M. C. Bateman, Felix Pichon, Alex Anderson and W. B. Reid, mine superintendents.

Large areas of land in Jefferson County, near Mount Vernon, have been sold recently for mining purposes and tests are now being made to ascertain the quality and the quantity of the coal. Two drills are now being used in testing out the field, which is said to adjoin the large acreage already acquired by the Nason interests in Jefferson County. One drill is now at work in Section 16 of Spring Garden township east of the Chicago & Eastern Illinois R.R. Many thousand acres of Jefferson County coal land have been sold in recent years and there are still large areas under option which are subject to sale. The Illinois Coal & Coke Corporation is the largest owner of coal land in Jefferson County, owning a tract of 30,000 acres in the southern part of the county, said to be one of the largest units of coal land owned by one company to be found in the United States. The Inland Steel Co. owns a tract of about 8,000 acres in the southern part of the county. The Southern Gem Coal Co. has extensive coal holdings in the vicinity of Waltonville and Sheller. F. S. Carson, of Waltonville, also owns approximately 1,800 acres of coal land in the vicinity of Waltonville.

The North American Co., E. W. Clark & Co., of Philadelphia, and the St. Louis & Belleville Electric Railway Co. may be **compelled to declare in court who owns the St. Louis & Belleville Electric,** an 18-mile coal road from Belleville, Ill., to East St. Louis, Ill. Suit has been filed by M. W. Borders, a Chicago attorney, asking an accounting in connection with the sale of the road to the East St. Louis & Suburban Ry. Borders asserts that E. W. Clark & Co. bought coal land on a 50-50 basis with him, which was to be developed jointly when a railway line had been projected from the St. Louis and Belleville line, and that E. W. Clark & Co. had agreed to buy his share of the land in case they sold their interest in the electric line.

Incorporation papers have been filed at Mt. Vernon for the **Southern Illinois & Kentucky R.R.** to extend from Edgewood in Effingham County, to Metropolis, opposite Paducah, Ky., and a branch from Akin, in Franklin County, southwest to the northern terminus of the proposed Benton Southern Ry. This opens up Jefferson and new parts of Franklin County coal fields. C. H. Markham, president of the Illinois Central R.R., is one of the incorporators.

INDIANA

Miners employed at the **Mt. Pleasant Coal Co.'s** mine south of Terre Haute declare they have been locked out. The mine has been closed and mine workers declare the management has refused to employ union men. The mine was opened only a short time ago and the men who were employed either were former members of the United Mine Workers or were members of other local unions. They applied for a charter and when they were admitted to the mine workers' union, G. R. Wilson, owner of the mine, is said to have discharged them.

Two men were killed recently and another seriously injured following an explosion in the **American Mine No. 1,** near Bicknell, owned by the Knox Consolidated Coal Co. It was reported that little damage was done to the mine property.

The offices of the Southern Indiana Coal Bureau, at Evansville, will be closed temporarily in the absence of H. W. Little, who has gone to Washington as secretary of the National Coal Operators' Association. It is probable the offices will not be reopened until next September.

Francisco mine No. 1, near Princeton, recently **broke its former production record** 1,772 tons of coal being hoisted in eight hours. This mine is becoming one of the largest producers in southern Indiana and is being modernized in every way. Every mine in the county started the new year right by working the first day of 1923.

The Clinton Coal Co.'s Crown Hill mine No. 3, southwest of Clinton, mining fourth-vein coal, **has resumed operations** after having been shut down for several months. Lightning damaged the brick stack at the power plant about six months ago, and until the outlook for selling coal brightened recently the stack was not repaired. Shipping conditions also have improved the business of the company sufficiently to warrant the opening of the mine, officials say.

The Arnold Fuel Co. of Indianapolis, has filed a final certificate of dissolution with the Secretary of State.

KENTUCKY

In view of a lot of talk concerning a business man **for the next governor of Kentucky, James R. Rash,** Madisonville, state senator, director, large stockholder and realty man for the St. Bernard Coal Mining Co. and father of Frank D. Rash, president of the St. Bernard, is planning to announce his candidacy on the Democratic ticket. Mr. Rash is one of the wealthiest and most influential residents of western Kentucky.

The Whitesburg mine of the Last Dollar Coal Co., at Whitesburg, was opened recently. It is on the Eastern Kentucky Division of the L. & N. R.R.

The Winchester Coal Co., of which N. M. White, Jr., of Prestonburg, is president, is planning extensive developments at Emma, on 175 acres of coal land, which will result in a production of eight cars of coal a day. The company is planning to install a steam hoist.

S. M. Reams, B. T. Milam and G. T. Anderson have incorporated the **Clear Fork Coal Co.** at Middleboro, Ky., with a capital of $150,000.

The Green River Coal Co., with post office address at Moorman, has been incorporated to do business at Mogg, with a capital of $20,000. The incorporators are: Carl A. Reis, L. D. Shearer and John R. Barrett.

The Fusonia mine of the McIntire Coal Co., at Fusonia, was opened recently. It is on the L. & N. R.R

The Letcher-Elkhorn Land Co., capital $50,000, a coal organization, **has been chartered** by Sam Collins, Lexington; D. I. Dat and Lewis E. Harvie, Whitesburg. These men have bought and leased acreage, and are planning some coal development projects. Mr. Collins is state prohibition officer.

Henry LaVoie, special representative of the Ford Motor Co., in Louisville a few days ago, in talking to the Louisville Ford dealers held that the **recent coal land purchases by Ford interests in eastern Kentucky were only a start,** as still further acquisitions are planned.

The Meem-Haskins Coal Corp. has opened the No. 2 mine, at Montago. This mine is on the L. & N. R.R.

The Idamay mine of the Smith-Abston Coal Co., at Idamay, was opened recently. It is on the L. & N. R.R.

MICHIGAN

The Koppers Co., Pittsburgh, Pa., will construct for the **Battle Creek Gas Co.**, Battle Creek, **a coal-gas plant** consisting of 11 byproduct gas ovens of the new Koppers type and a Koppers gas producer equipped with a waste heat boiler. The ovens will be 13½ in. wide and have a capacity of approximately 6¾ tons per charge. Based on coking speed of 12 hours, the plant will have a capacity of 1,500,000 cu. ft. of gas per day when heated with producer gas.

MINNESOTA

The Blue Diamond Coal Sales Co., of Cincinnati, has moved its western office, heertofore at Iowa Falls, to Minneapolis, and has opened quarters in charge of H. J. Stickney. Dock space for 250,000 tons at Duluth and Superior has been obtained and both a dock and all-rail business will be done.

The North Dakota Lignite Coal Operators' Association suggests the possibility of establishing a steel center at the Twin Cities by the use of cheap lignite fuel to work on Minnesota ores and having the large labor market of the Twin Cities to draw upon.

MISSOURI

The Otterville Mining Co., which was organized at Otterville, two months ago to prospect for coal, has sunk a shaft about 30 ft. and encountered tunnels and workings of some old abandoned mine. Three stone hammers or mauls have been found, which are different from any kind now found in this section. The oldest residents have no recollection of any white men working such a mine, and Captain Frank A. Shults, the superintendent, believes the work that of some people who inhabited the country before the coming of the white man.

The Peerless Fuel Co. has been incorporated in St. Louis to acquire by purchase, lease or otherwise, to construct, develop and operate coal mines and properties; manufacture, buy, sell and deal in coke and byproducts of coal and minerals; capital, $40,000. Shareholders: John Henderson, Carl Voigt and E. W. Brandenbruger.

The Turpin coal mine at Brookfield, which was flooded with water a few weeks ago, is being opened by Thomas Grubbs & Co., who expect to be able to deliver coal in the near future. The company has pumped the water out of the mines and has started the fans to going, preparatory to sending men into the shaft.

After he refused to give a satisfactory explanation regarding assets of a bankrupt concern in which he was a principal, **George W. Carter**, head of the Carter-Williams Coal & Grain Co., of St. Joseph, was sentenced to an indefinite term in the Buchanan County jail for contempt of court by Judge Arba S. Van Valkenburgh, of the federal court Dec. 26, 1922.

MONTANA

A bill calling for an **investigation of the cost of producing and selling coal** in this state has had two readings and is expected to pass the Legislature.

Montana market conditions are peculiar. Operators in the Roundup field, on the Chicago, Milwaukee & St. Paul R.R., report that they have been working steadily. The mines on the Great Northern, near Great Falls, have been handicapped only by lack of transportation. The railroad is taking practically all of the small coal. The Red Lodge mines of the Northern Pacific R.R. have been steadily working, but the mines in the Bearcreek field, over the hill, are in a slump. One operation put in only three days during the first two weeks of January.

NEW YORK

Charles F. Hurd, Jr., formerly assistant secretary of the Hillside Coal & Iron Co., has been made assistant to the president and assistant secretary, effective Jan. 1, 1923. Mr. Hurd takes up the duties of T. S. Pendreigh, deceased. His headquarters will be 165 Broadway, New York City.

Henry L. Harnden, formerly with the Garfield & Proctor Coal Co. and later in charge of bituminous coal sales for the Tuttle-Berger Coal Co., and **Kenneth F. Cramer**, formerly Connecticut representative of the Garfield & Proctor Coal Co. and later New England representative of the Tuttle-Berger Coal Co., **have formed the Hornden-Cramer Coal Co.**, with offices at 150 Nassau Street and a branch office in Hartford, Conn. They will transact a wholesale coal business.

O. D. Street, for the past ten years general manager of distribution of the Western Electric Company, has been **elected vice-president of the McGraw-Hill Company**, in executive charge of the **Electric Railway Journal, Bus Transportation, Electrical World, Electrical Merchandising, Journal of Electricity and Western Industry** and **Industrial Engineer.** Mr. Street brings to these publications a broad background of business training and an extensive contact in the electrical industry.

Mr. Street was born in Massachusetts in 1877. He entered the organization of the Western Electric Company in 1901 on his graduation from Williams and has a broad practical training. He was in charge of telephone sales on the Pacific Coast, assistant to the president, Atlanta branch manager, general telephone sales manager and latterly general manager of distribution. During the war he rendered invaluable service in reorganizing the warehousing division of the Quartermaster's Corps and establishing an orderly system of forwarding to Pershing's army where chaos had existed before.

Ernest L. Smith, recently appointed Fuel Administrator for Queens County, has opened an office at 422 Jackson Ave., Long Island City. His chief assistant will be Oscar F. Shaw.

The Westmoreland Coal Co. has declared a stock dividend of 33⅓ per cent, payable Feb. 1 to stockholders of record Jan. 20.

The first step in making a national corporation out of the present Burns Brothers Coal Co. is seen in the preparations which have been made calling for the organization of the National Coal Co. under the laws of the State of New Jersey. Application for a charter is expected to be made soon. The company will have an authorized preferred capital of $10,000,000 and also 500,000 shares of common stock without par value. When the Burns Brothers Coal Co. took over control of the William Farrell Coal Co. some time ago officers of the former organization announced that it was their intention to nationalize the company and extend its operations to the larger cities in other sections of the country. Many rumors have been afloat within the recent past that Burns Brothers was negotiating to take over the Consumers' Company of Chicago, the largest distributors of coal and ice in that city. Reports circulated some time ago also declared that the company intended to take over retail coal distributing organizations in St. Louis, Philadelphia and Boston.

That there are teeth in the New York State Fuel Administrator Law and that those teeth can bite was shown at Syracuse on Jan. 26, when **Fred Kenyon, a coal dealer, arrested as a coal gouger** under the fuel administration, was convicted by a jury in police court and sentenced by Justice Shove to serve three months in the penitentiary and pay a fine of $100. Kenyon was accused of having sold 81½ lb. of coal Jan. 16 when 100 lb. had been asked and paid for by the customer.

Among arrivals from Europe on the Berengaria Jan. 27 were C. M. Barnett, vice president of the Clinchfield Navigation Company, and L. R. Lewis, C. B. E. and H. Merritt, Welsh coal-mine owners.

OHIO

The Monsarrat Mining Co., chartered with a capital of $200,000 to mine coal in the Hocking Valley section, is an incorporation of a going concern which has been conducted under the name of Monsarrat Bros., in Columbus. The company has three large mines with a large acreage on the T. & O. C. side of the Hocking Valley. Incorporators are N. D. Monsarrat, C. R. Monsarrat, F. H. Watson, Aaron DuBois and William H. McCall. N. D. Monsarrat is president and C. R. Monsarrat vice-president. At the same time the **Monsarrat Bros. Coal Co.** was chartered with a capital of $25,000, by the same incorporators to act as selling agent for the mines and to do a general wholesale business. C. R. Monsarrat is president; N. D. Monsarrat is vice-president, and F. H. Watson, secretary and treasurer. F. H. Watson has been acting as sales manager of the concern.

The Board of Purchase of the Columbus municipal government has rejected all bids opened Jan. 17 for approximately 13,000 tons of nut, pea and slack for various city departments and the city council adopted a resolution authorizing the buying of coal on the open market.

Homer C. Gill, a Columbus retailer and president of the Michigan-Ohio-Indiana Coal Association, is recovering from a severe attack of grippe.

Changes brought about by the war have raised the cost of labor in Europe very materially and there is an increasing call there for equipment of the American type. An interesting example of this is the **coal crane supplied to the Coal Trading Association of Rotterdam** by a well-known engineering firm of Cleveland, Ohio, for in spite of the depreciated state of German currency and the lower price of labor in England, Belgium and France, these careful Rotterdam business men purchased this important equipment in America and placed it in the most competitive center of industrial Europe. The machinery is now in operation, being used to transfer ore from tramp steamers to Rhine barges and coal from like barges into ocean-going steamers for shipment abroad.

PENNSYLVANIA

Stockholders of the **Jefferson-Clearfield Coal & Iron Co.** met in Indiana on Jan. 16 and voted an increase in the present capital stock from $3,000,000, consisting of $1,500,000 preferred and $1,500,000 common stock to $7,500,000 by the issuance of $100 par value of additional common stock. The directors previously had declared, subject to the approval of the stockholders of the increase in stock, a dividend of 150 per cent payable in common stock on Jan. 18 to preferred and common stock of record at the close of business Dec. 30, 1922.

Fifteen hundred mine workers who for five days had tied up the production of anthracite coal at the Woodward colliery of the **Glen Alden Coal Co.** Edwardsville, with a petty grievance strike, voted Jan. 10 to return to work, following talks by District President William J. Brennan, Board Member John Boylan and several other officials of District No. 1, all of whom urged the men to call off the strike. **The men went back to work Jan. 11.** The grievance, which was occasioned by the transfer or discharge of an employee at the colliery, will be taken up in the customary way, through the board of conciliation.

The hearing on the protest by Isaac T. and Mary T. W. Starr against the sale of the stock of the **Lehigh & Wilkes-Barre Coal Co.** to the Jackson E. Reynolds Syndicate of New York has been postponed by the United States District Court at Philadelphia from Jan. 3 to Jan. 24. The postponement, it was reported, was made at the request of the Department of Justice.

The Burnwell Coal & Coke Co., a Johnstown corporation, has erected one of the most modern tipples for the dumping of coal and coke in the state. It is built of steel-cement and steel beams and has a capacity of 800 tons a day, with adequate room for unloading trucks, with separate exits and entrance. The tipple is situated on the Johnstown & Stoney Creek R.R., which connects with both the B. & O. and the P. R.R., thus affording every railway facility for coal shippers.

The Lilley Coal & Coke Co. held its annual meeting Saturday, Jan. 13, at the residence of Mrs. Jane Elliott, near West Brownsville. The following directors were elected: Thomas Elliott, Mrs. Jane Elliott, John H. Moffitt, Walter T. Lilley, and Charles E. Lilley of Bluefield, West Virginia. The present officers are: Thomas Elliott, president; Mrs. Jane Elliott, vice-president; John H. Moffitt, secretary and treasurer, and Guy Moffitt, solicitor. The Lilley company is one of the most active operating companies in the coal mining business in the Great Monongahela Valley.

The Philadelphia & Reading Coal & Iron Co. has just let the contract for fifteen blocks of houses, comprising accommodations for thirty families, to the Bell Lumber Co., Inc., of Minersville, and preliminary work has been started. Ten of the blocks will be built at Phoenix Park and five at Branchdale. The floor plans will be identical in each case, but variation in placing the covered porches, in some cases at the front and in others at the side, coupled with the company's established custom of painting no two adjoining blocks in the same colors, will give variety of external appearance. The houses will be frame, with asbestos shingle roofs and concrete cellars extending the whole length of the building. There will be six rooms in each house and, in conformity with the established policy of the Reading's land department, each will have at least two windows. This is the first housing contract of any magnitude in the lower anthracite field for 1923, and construction probably will be complete by early summer.

Roy V. Whitman, formerly with the Ebensburg Coal Co. at Ebensburg, Pa., is now chief engineer with the Standard Oil interests at Maracaibo, Venezuela.

W. G. Shallcross, formerly superintendent of mines with the Ford Collieries Co., Curtisville, has recently taken charge of the mines of the Fox Coal Co., Portersville.

G. M. Butterfield, identified with the Jamison Coal & Coke Co.'s Pittsburgh office for 21 years, and **B. B. Blair**, who was with the same company for 15 years, have organized a company for the purpose of dealing in coal and coke under the name of the **Western Pennsylvania Fuel Co.** Offices are located in Greensburg.

Operating officials of the H. C. Frick Coke Co. gathered at the Greensburg Country Club recently for **their annual dinner.** W. H. Clingerman, president of the coke company, acted as toastmaster. J. W. Anawalt spoke on "The Union Supply Company; Its Mission and Purpose." "The Problem of Mechanical Coal Loading" was the theme of G. E. Huttle of Scottdale. R. E. Kirk spoke on "Human Relations in Industry."

Charles Brown, 35 years old, yard boss for the Hillman Coal & Coke Co. at Luzerne plant at Maxwell, Luzerne township, was **shot twice and killed instantly** Jan. 20 by William Thompson, a negro, who had been discharged Friday by the yard boss. On Friday he had words with the negro over the way the latter was doing his work. He told the negro, it was said, that if he would not follow instructions he might consider himself discharged. The negro ignored the official and was ordered to leave the plant. When Brown was at breakfast at a boarding house the next morning, the negro entered and shot him twice. Brown leaves a wife and three children.

UTAH

The Columbia Steel Corporation, San Francisco, has placed a contract with the Koppers Co., Pittsburgh, Pa., **to install a byproduct coke plant** at Salt Lake City, in connection with a blast furnace which is to be erected there. The plant will consist of 33 ovens of the new Koppers type, having a daily carbonizing capacity of 1,000 tons of coal. The plant will run on Utah coal and this will mark the first attempt to carbonize Utah coal in a commercial way in byproduct ovens. Construction will begin immediately and it is expected the plant will be completed in about a year.

VIRGINIA

Chester B. Koontz, representative at Norfolk, for the Willard Sutherland Coal Co., has been made president of the Hampton Roads Foreign Trade Club, reorganized to include in its membership representatives of practically every shipping concern in this port.

The Southern Fuel Co., of Norfolk, has been incorporated for $50,000. T. Levy is president of the company and J. W. Powell is secretary.

WEST VIRGINIA

A. C. Westfall, of Buckhannon, has leased from Senator R. E. Talbott of Philippi, W. Va., a large coal mining property at Wilmoth, in Randolph County. The property is ready to operate, being equipped with a tipple and other mining appurtenances.

Sufficient progress has been made by the **Virginia & Pittsburgh Coal Co.** in the driving of headings at its Morgan mine No. 2 to enable this company to load a small tonnage of coal over an old tipple at the No. 2 mine. When the company is able to load coal to capacity at this mine, daily production will reach approximately 1,500 tons a day. The Morgan mine adjoins the Parker Run plant of the Fairmont & Cleveland Coal Co.

The Beveridge Co-operative Coal Co. has been organized for the purpose of operating in Upshur County, having a capitalization of $10,000. The office of the concern is to be at Buckhannon. Interested in this new enterprise are W. P. Beveridge, A. V. Rush, G. D. Toler, June Toler, Joe Barnes and Robert Cook, of Buckhannon.

M. B. Coulter, former West Virginia State Mine Inspector, is now superintendent of mines at Elm Grove, W. Va.

L. E. Frick, of Frick & Blair, Evansville (Ind.) operators, was in Cincinnati recently after a visit to the Harlan (Ky.) fields, where mining properties were gone over with a view to purchasing a going operation

The Graham Smokeless Coal Co., at Graham, has been incorporated for $470,000 and has elected the following officers: President, W. R. Graham, of Bluefield, W. Va.; secretary, R. L. Hailey, of Bluefield, W. Va.

WASHINGTON, D. C.

By purchasing the land occupied by the fuel yards at South Capital and I Streets, from the Pennsylvania R.R., it is hoped to **reduce the cost of delivering coal** from the Government Fuel Yards to the various divisions of the District Government and government buildings 10c. a ton. A net saving of approximately $8,000 a year is expected to be realized.

CANADA

After being in effect for several days the **embargo on soft coal and coke shipments on the Pennsylvania R.R. was lifted on Jan. 24** and coal will now be accepted from mines in the area affected—the bituminous field of Pennsylvania—for shipment to Buffalo and points in Canada. The removal of the embargo will have the effect of releasing for shipment to Ontario many carloads of soft coal and coke, which will go a long way toward helping to make up for the shortage of anthracite. John Macdonald has returned to Toronto after representing the Nova Scotia coal miners at the labor congress in Russia. He declares that the German industrialists will get no military assistance from Soviet Russia in the present difficulties with France.

Sale of St. George's coal fields on the west coast of Newfoundland, is reported. It is stated that an English company is the purchaser for $1,000,000, part cash, and the balance secured by eight per cent bonds of the company.

Hon. W. E. Knowles, K. C., Moose Jaw, has accepted an invitation to become independent chairman of the committee which will have placed before it the disputes between the miners and operators in the Midwest, the Canmore, the Crow's Nest and Brazeau collieries. The other members of the committee will be Robert Young, Commissioner of the Canadian Coal Operators' Association, and Robert Livett, representative of the United Mine Workers. Sessions have been opened in Calgary.

William Ryan, district president of the United Mine Workers of America, **was found guilty Jan. 24 of assault**, and remanded for sentence until this week. Crown witnesses testified that on Dec. 2 Ryan, in company with pickets, tried to restrain Boss Carpenter Klinch, at the Black Diamond mine, from going to work.

No. 5 Mine, Cumberland, Canadian Collieries (D) Ltd., has been closed down. Temporarily there will be no production from these workings, although the mine plant and equipment will be kept in condition for the resumption of operations when conditions warrant it.

It is reported that all the coal properties and claims controlled by the late Lord Rhondda in central British Columbia have passed into the hands of British interests organized for colonization work and for the development of natural resources in western Canada. Some of these properties are situated north of the town of Terrace on the Grand Trunk Pacific Railway, about 90 miles east of the seaport of Prince Rupert. A market for the coal, which it is proposed developing, may be obtained at Prince Rupert and it also is expected that an export trade to South America may be anticipated.

DECEMBER OUTPUT OF COAL IN BRITISH COLUMBIA

Obituary

James C. Patterson, for the last thirty-five years a leading figure in the coal-mining industry in the Birmingham (Ala.) district, died Jan. 19 at his residence in Birmingham after a short illness, aged 75 years. Coming to this country from Scotland and first settling in Pennsylvania, later moving to Ohio, and coming to Birmingham district in 1885, he obtained employment with the Tennessee Coal, Iron & Railroad Co. as a miner. He forged to the front rapidly and held various official positions as a mining executive, and for a number of years was the executive head and principal owner of the Jagger Coal Co., New Found Coal Co. and West Helena Coal Co., and also held extensive interests in the Pratt Consolidated Coal Co., of which he was a director. Mr. Patterson was widely known and held in high esteem among his friends and acquaintances.

H. A. Paynter, coal operator, 40 years old, died at Winchester, Ky., Jan. 12, following a short illness. He was president of the firm of H. A. Paynter & Co. and had been prominent in the coal fields of eastern Kentucky for several years. He was a native of Carter County. His widow and two children survive.

George H. Hulett, of Cleveland, noted in the engineering field as a designer of heavy equipment for handling coal and ore, died at Daytona, Fla., Jan. 17, at the age of 76 years. Mr. Hulett was born in Conneaut, Ohio. In 1890 he became engaged in the manufacture of coal and ore handling machinery in Cleveland. In 1898 he became associated with the Variety Iron Works, Cleveland, as engineer of construction, and in 1903 he became an engineer of the present McMylern Interstate Co. and developed the Hulett unloading machine while with this company. In 1907 he became connected with the Webster, Camp & Lane Co., Akron, which soon afterward was consolidated with the Wellman-Seaver-Morgan Co., Cleveland. He was vice-president and director of this company, with which he remained until 1918. Then he became associated with his son, Frank E. Hulett, who organized the Hulett Engineering Co., and was its vice-president. He was a member of the American Society of Mechanical Engineers and of the Cleveland Engineering Co.

J. M. Kennedy, a pioneer mine operator, died at his home at Minto, N. B., on Jan. 17. He managed and controlled the Northfield Coal Co. until it was disposed of several years ago to the International Paper Co., and since then he had managed the Minto Hotel and had been engaged in other business enterprises, being exceptionally active, although 77 years old.

Cornelius Schrepferman, a well-known coal operator of Brazil, Ind., died in an Indianapolis hospital recently of paralysis. He was thirty-six years old. He had been connected with the Brazil block coal field business since a youth, having formerly been in business with his father, Nicholas. Mr. Schrepferman was in charge of mine operations while his brother had charge of the Indianapolis selling office. He is survived by the widow and a son and daughter.

Herbert Henry Ashley, 80 years old, former president of the Parrish Coal Co., died at his home in Wilkes-Barre, Pa., on Jan. 20. For forty years he was engaged in the anthracite mining industry and was a member of the old firm of Parrish, Phillip & Co., of New York City. Mr. Ashley was an old resident of Plymouth, removing to Wilkes-Barre in later years. At the time of his death he was vice-president and a director of the First National Bank of Wilkes-Barre, president of the Hazard Manufacturing Co. and was associated with the Vulcan Iron Works.

Francis Marion Dugger, 81, a capitalist and one of the pioneers in the Indiana coal-production industry, died recently at his home in Bloomfield, Ind. Mr. Dugger was a veteran of the Civil war. He was elected sheriff of Greene County, Ind., in 1866 and was re-elected three times. He was a pioneer in the development of the coal fields of Sullivan and Greene counties. As early as 1882 he became interested in coal fields and one of his first shafts was sunk near the present town of Dugger, which was named in his honor. He also sunk shafts near Linton, Midland and Jasonville, all in Indiana. For many years he was president of the Citizens State bank of Bloomfield, also of the Bloomfield Trust Co.

Traffic News

Supplement No. 23 to summary of informal embargo notices No. 3, issued Jan. 25, by the New York Central R.R. is as follows: Account embargoes placed by other lines **embargo 138 is placed by the Boston & Main R.R.** on all freight from the Boston & Albany R.R. at all junctions for movement to or via the Boston & Maine R.R., except freight which originates at stations on the Boston & Albany R.R.

Embargo 116, placed Jan 19 by the Philadelphia & Reading Ry. on bituminous coal destined to Port Richmond piers, Port Richmond, Philadelphia, Pa., **is extended** to cover all shipments consigned to Coale Corporation, Emmons Coal Co. and Willard Sutherland. **Embargo is modified** to permit shipments consigned to C. J. Mittenberg to come forward.

Embargo 76, placed Jan. 13 by the Philadelphia & Reading Ry. covering bituminous coal to Port Reading piers, Port Reading, N. J., is **modified** to permit shipments to come forward consigned to Whitely & Foedisch and Empire Coal Mining Co.

In a tentative report in the case of the Indiana Power Co. vs. the Pittsburgh, Cincinnati, Chicago & St. Louis Ry. Co., Interstate Commerce Commission Examiner Paul O. Carter finds that the rate of **70c. per net ton** charged for the transportation of bituminous coal from the carriers' team tracks at Edwardsport, Ind., to the complainant's plant was **unreasonable.** Reparation is recommended.

The American Railway Association has appointed **S. H. Charles as district manager of a newly created car-distribution district** composed of Alabama, Tennessee, Mississippi, Georgia, Florida, North and South Carolina and the New Orleans terminals, with headquarters in Birmingham, and coal operators and shippers generally expect a more equitable distribution of cars in the future and more prompt attention to complaints on transportation matters.

The I. C. C. has dismissed the complaint of the City of Detroit against the Chesapeake & Ohio Ry. Co. et al. in which it was alleged that the charges collected by the defendants on approximately 12,000 tons of bituminous coal shipped in carloads between May 3 and Aug. 1, 1921, from Holden and other points in the Kanawha district in West Virginia via the Chesapeake & Ohio. Chesapeake & Ohio Northern, and Hocking Valley to the dock at Toledo, Ohio, for transshipment across lake, were unreasonable, unjustly discriminatory and unduly prejudicial.

The Coal, Coke and Iron Ore Committee, Central Freight Association Territory, announces a public hearing 10 A.M., Feb. 8, instead of Feb. 1, as previously announced, to **consider cancellation of rates** on coke, coke ashes, coke breeze and coke dust, carloads, to Moline, Rock Island, Ill.; Davenport, Ia., and Omaha, Neb., in connection with C. B. & Q., C. M. & St. P. and C. R. I. & P. railways from origin stations in the Clairton, Connellsville and Gallitzin districts, as set out in P. R.R. Tariff AA I. C. C. 1843.

The Corona Coal Co., of Birmingham, Ala., is seeking to recover reparation from the St. Louis-San Francisco Ry. for the rates charged from Sept. 1, 1920, to Dec. 29, 1921, on all coal which moved from its mines to Pensacola, Fla., for bunker purposes. In addition, the Corona company had under contract the bunker coal output of the Empire Coal Co. The Corona company contends that the rate charged was unreasonable to the extent that it exceeded $2 per ton.

G. H. Sewards, of the West Kentucky Coal Bureau, Louisville, is back from Atlanta, Ga., where he attended a hearing before the Southern Freight Rate Committee regarding rates to the Southwest. It is proposed that rates from west Kentucky to southern Louisiana, now 25c. per ton over rates from Alabama, be placed on the same basis as rates from Alabama.

The Coal, Coke and Iron Ore Committee, Central Freight Association territory, will hold a public hearing Feb. 8, at 10 A.M., **to consider rates on bituminous coal,** carloads, to stations on Chicago & Erie R.R., Uniondale, Ind., to Huntington, Ind., inclusive, and to stations on Wabash Ry., La-Gro, Ind., to Huntington, Ind., inclusive, from mines in Inner Crescent, $2.96 per net ton with usual differential to apply from Mines in the Outer Crescent. The hearing will be held at room 606, Chamber of Commerce Building, Pittsburgh, Pa.

The I. C. C. has dismissed complaint in Docket No. 11777, Lehigh Silk Dyeing Co. vs. the Director General of Railroads, as agent, and the Lehigh Valley Railroad Co., having found that the charges assailed were not unreasonable, or otherwise unlawful, except to the extent that they exceeded those which would have accrued if complainant's shipments had been actually placed in the order of their arrival. Complaint alleged that the demurrage charges collected at Allentown, Pa., in August, 1918, on certain interstate shipments of bituminous coal were unreasonable, unjustly discriminatory and unduly prejudicial, and asked for reparation.

Examiner Mackley, for the I. C. C., has made a tentative report in Docket 13594, Megeath Coal Co. vs. The Director General of Railroads, in which he recommends that "the **rates on coal from Winton, Wyo., to destinations in Washington, Oregon and other Western states, be found unreasonable** to the extent that they exceeded the rates in effect at the time shipments moved from the Rock Springs-Kemmerer group in which Winton was subsequently included." The shipments moved between Jan. 7, 1919, and March 19, 1919.

The I. C. C. has dismissed complaint in Docket 13040, Hazel Atlas Glass Co. vs. the Director General of Railroads as agent of the Pennsylvania R.R., having found the rates assailed by complainant to be applicable. Complainant alleges that the Washington, Pa., rate of 45c. charged on 180 carloads of coal shipped between Jan. 1 and June 24, 1918, from Meadow Lands, Pa., to its plant No. 2, on the Tylerdale Connecting Railway in Canton Township, Pa., was inapplicable and unreasonable.

In Docket No. 12412—Texas Steel Co., R. S. Collins and W. H. Lantz, Receivers, vs. Director General of Railroads as agent, Chicago, Rock Island & Pacific Railway Co., et al.—**the I. C. C. finds that rates on coke, in carloads, shipped from Potter, Okla., to Rusk, Texas, during federal control, were unreasonable,** and awards reparation to complainant. The Texas Steel Co. alleged that the rates charged on 121 carloads of coke shipped between Jan. 14 and May 23, 1919, inclusive, from Howe-Potter, Okla., to Rusk, Texas, were unreasonable and in violation of Sec. 4 of the Interstate Commerce Act.

Association Activities

West Kentucky Coal Operators' Association

C. F. Richardson, of Sturgis, representing the West Kentucky Coal Co., has been named president of the West Kentucky Coal Operators' Association for the coming year. Other officers named are: J. D. Overall, Madisonville, of the Reinecke Coal Mining Co., vice-president, and C. E. Reed, secretary. The executive committee includes the following new members: F. P. Wright, Bevier, of the Crescent Coal Co.; H. L. Tucker, Central City, of the Rockport Coal Co.; A. W. Duncan, Greenville, of the W. G. Duncan Coal Co.; M. B. Lanier, Nortonville, of the Norton Coal Mining Co.; P. D. Berry, Providence, of the Providence Coal Mining Co.; Brent Hart, Morton's Gap, of the Hart Coal Co., and F. D. Rash, Earlington, of the St. Bernard Mining Co. An organization has been formed for handling transportation matters and seeking better freight rates. As usual, some of the newspapers came out with stories of the last meeting and argued around prices as the basis of the meeting. One paper later retracted its story on price discussion, which is not within the province of the organization. J. Van Norman, attorney for the organization, talked on traffic matters and cases handled before the Interstate Commerce Commission, and C. E. Reed made an interesting report of the year's work.

Hazard Coal Operators' Exchange

J. E. Johnson, Lexington, Ky., was elected president of the Hazard Coal Operators' Exchange at the annual meeting Jan. 13 in Lexington. J. T. Hatfield, Cincinnati, was chosen vice-president, and H. E. Bullock, treasurer. The secretary's office is appointive, by the executive committee. The executive committee elected was: Carol Robinson, Lexington; William J. Brown, Jr., Lexington; S R. Johnson, Johnson City, Tenn.; J. H. Bowling, Lexington; Henry Pfenning, Lexington; James Bonneyman, Cincinnati; H. K. English, Lexington; Prentice Burlingham, Cincinnati; W. E. Davis, Lexington; George W. Hay, Jenkins; W. S. Dudley, Lexington; H. H. Heimer, Columbus; A. L. Allais, Chicago, and G. P. Fitz, Hazard. A banquet was held at the Phoenix Hotel, with over 300 covers laid. W. O. Davis was toastmaster, and talks were heard from the Governor, leading coal operators and some of the big men of eastern Kentucky.

Cincinnati Coal Exchange

—The tenth annual banquet of the Cincinnati Coal Exchange was held Jan. 23 at the room of the Automobile Club and was attended by 125, the largest in its history. George Cushing, of Washington, in a characteristic talk advised resistance to the demands of the Fact Finding Commission for business information that would lead into the private affairs of the selling companies. J. D. A. Morrow, now a member of the Cincinnati trade, made a happy little talk on the coal trade as seen from the viewpoint of the upbuilding of man from the monkey stage of three million years ago. He said that probably this was the cause of too much "monkey government" in Washington. Charles Dering, of Chicago, and Joe Tuohy, were among others who featured the program.

Tug River Coal Operators 'Association

At the annual meeting of the Tug River Coal Operators' Association, held in Bluefield on Jan. 4, the following officers were elected: L. Epperly, of Bluefield, president; A. F. Leckie, of Welch, vice-president; C. C. Morfit, of Welch, secretary; J. T. Wilson of Bluefield, treasurer. The new president of the association is general manager of the Collins interests in West Virginia, having his headquarters at Bluefield. At its annual meeting the association indulged in a thorough discussion of conditions now affecting the industry, the transportation situation coming in for a lion's share of the discussion, as the full operation of mines in the Tug River field has been interfered with to a great extent by the inability to obtain cars.

Northeast Kentucky Coal Association

Levity and entertainment and the Chamber of Commerce smoker closed the meeting of the Northeast Kentucky Coal Association Jan. 25 at Ashland, Ky. Officers elected are C. W. Conners, Esco, president; E. R. Price, Vanlear, vice president; E. L. Bailey, Lookout, second vice president; George B. Archer, Prestonsburg, treasurer; Henry Laviers, Paintsville, T. S. Haymond, Wayland, and G. W. Hay, Jenkins, executive committee; C. J. Neekamp, secretary.

Coming Meetings

Northern West Virginia Coal Operators' Association will meet Feb. 13 at Fairmont, W. Va. Secretary, G. S. Brackett, Fairmont, W. Va.

American Institute of Mining and Metallurgical Engineers will hold its annual meeting Feb. 19-22, 1923, at the Engineering Societies Building, New York City. Secretary, F. F. Sharpless, New York City.

International Chamber of Commerce will hold its second general meeting in Rome, Italy, March 19-26.

American Society for Testing Materials will hold its annual meeting at the Chalfonte-Haddon Hall Hotel, Atlantic City, N. J., beginning June 25 and continuing throughout the week. Secretary, E. Marburg, Philadelphia, Pa.

The Colorado & New Mexico Coal Operators' Association will hold its annual meeting June 20 at Denver, Col. Secretary, F. O. Sandstrom, Denver, Col.

National Foreign Trade Council will hold its annual conference April 25-27 at New Orleans, La.

Pittsburgh Vein Operators' Association will hold its annual meeting Feb. 12 at the Hotel Cleveland, Cleveland, Ohio. Secretary, D. F. Hurd, Cleveland, Ohio.

The Upper Potomac Coal Association will hold its annual meeting Feb. 10 at Cumberland, Md. Secretary, J. F. Palmer, Cumberland, Md.

Northwestern Pennsylvania Coal Operators' Association will hold its annual meeting March 6 at the William Penn Hotel, Pittsburgh, Pa. Secretary, T. F. Diefenderfer, Butler, Pa.

Canadian Institute of Mining and Metallurgy's annual meeting will be held March 7, 8 and 9 at the Mount Royal Hotel, Montreal, Quebec, Canada. Secretary, George C. Mackenzie, Montreal, Quebec, Canada.

COAL AGE

The Only National Paper Devoted to Coal Mining and Coal Marketing

C. E. LESHER, *Editor*

Volume 23 NEW YORK, THURSDAY, FEBRUARY 8, 1923 Number 6

Overdevelopment and Nationalization

IN HIS annual report Director Bain of the Bureau of Mines points out and decries the tendency of the West—that is, the public-land states—to so increase coal-mine development beyond current needs and thus "to bring about the same unhealthy condition [that is to say, overdevelopment] in the West, the same loss of capital and distress among miners that was so marked a feature of 1921 in the East and Middle West." Mr. Bain thinks that the federal government should be given some discretion in granting extension to the coal-mine development of the public-land states.

On another page we publish the protests of a correspondent from Lewis County, Washington, against talk of the coal industry being overdeveloped, in so far as his part of the world is concerned. Mr. McBride holds that the West is not overdeveloped, that it needs more coal mines—especially larger, better operations. He regrets that this charge has been spread over the West, hindering acquisition of new capital. We have heard operators in the East as well express the wish that the Coal Commission had not publicly advised against investment in the soft-coal industry.

Director Bain points out that, "taking into account all mines now operating on private lands and government leases, there will be built up within two years in thirteen Western states a mine capacity of 80,000,000 tons, whereas the maximum war-time market for coal from these states was 40,000,000 tons, and is now less." Remedial legislation obviously would take the form of permitting the withholding of coal leases on public lands. The present Secretary of the Interior, Mr. Fall, apparently has held that the leasing law compels the department to give all applicants the coal lands they desire to lease, although, as Mr. Bain points out: "The department cannot, however, without violation of the plain intent of the law, grant leases without setting up requirements as to minimum production per annum. It was clearly not the intent of Congress that leases should be granted to tie up land for long periods for speculative purposes. So each lease granted must require the mining of a minimum amount of coal per year and the giving of effective bond for performance. The results that flow from this seem to have been overlooked by the lessees and others."

The West is not overdeveloped, at least not notoriously so. When in the boom year of 1920 the soft-coal mines of the country as a whole averaged but 220 days' operation, Montana did 250 days, New Mexico 302, Wyoming 264, Colorado 255, and Washington 260, although Lewis County, in which Mr. McBride operates, did but 201 days. Such comparatively good records of operation do not indicate a great superfluity of coal mines. On the other hand, this winter, while the East is experiencing a car shortage and prices to suit, the Far West is chalking up time lost because of "no market."

We quite agree with Director Bain's general theory —that the coal industry of the West is storing up future grief for itself when it doubles its capacity in two years. The industry is far better off when production on a full working schedule more nearly matches demand. Were the federal government to undertake to hold back the granting of leases on public lands on any pretext of saving the industry from itself, the protest would be loud and long. While the East is debating nationalization of coal and stewing over ways and means of curing overdevelopment and irregular operation, there lies within our hands a nationalized piece of this self-same industry.

Under the leasing measure, we retain title to the coal and rule through bureaus at Washington on how the coal shall be mined, even as in France.

If we, the American people, through our Congress, want to exercise our rights of ownership, we can do whatever we desire with these public coal lands of the Far West. Is it not significant of the temper of the country that these lands are being turned over to private enterprise even as the farmer-owned lands of the East?

Knuckling of Mine Cars

SO MANY are the causes of derailments that one cannot wonder that A. S. Brosky omits one of them in his interesting article that we publish this week. Too many mine engineers design changes in the vertical alignment of track in a manner in which they would never design horizontal changes. That is, they will allow their vertical alignments, or gradients, to meet in a sharp peak but will insert curves between their horizontal alignments. Every important change of grade, every knuckle or dip, should be carefully and deliberately rounded off so that one car cannot be on one gradient and the next on an entirely different one.

This provision is more important in mines than on a railroad, because it is customary to provide in the former case that the overhang of the end of the car shall be as long as the wheelbase or, what is the same, that the car shall be three times the length of the distance between axle centers. This seems also to be the English rule. No one knows why this relationship has become established. Certain it is that knuckles in the track would have a less injurious effect if the wheels of mine wagons, as in railroad cars, were placed near the bumpers. Unfortunately, however, the tendency is all the other way. Two cars, recently illustrated in *Coal Age*, one in use in Montana and the other in West Virginia, were 4.1 times as long as their wheelbases. At a mine in Tennessee two separate types of cars had this ratio as high as 5:1. In the last two instances the overhang was more than twice as long as the wheelbase.

Any given change in gradient or any irregularity in the track such as an uneven joint will cause a greater movement at the bumpers than would occur if railroad practice as to the location of the wheel support were

followed. Should the bumpers fail to slip past each other, as they may when the trip is being pushed or held back on a steep grade, then the end of the car needing such a movement to adjust itself to changing track conditions on seeking to go downward might be lifted off the track, or in seeking to rise might tilt the end of the car nearest it, or tilt its own opposite end upward, provided the movement between bumpers at that end is not sufficiently restrained by the weight of the car and the bumper resistance.

Cars with a liberal overhang have the advantage that they can be more readily turned on a sharp room switch and can be more speedily replaced when they leave the track, but they can be detracked with equal ease, and the question arises whether it would not be better to use a longer wheelbase and make the turns into the rooms of somewhat greater radius. Fortunately the necessity for moving mining machines and still more power loaders into rooms is making managements more favorable to the use of easier room curves, but this has been accompanied by an increase in the length of cars, so that what has been gained in one direction has been lost in another.

Submerged Pumprooms

SUCTION will lift water only about 25 ft. in practical operation. It is necessary, therefore, to place pumps down close to the bottom of the mine that they are to keep free from water. Unfortunately, if the water rises, the pump is soon flooded and useless. Of course, pumps can be built that can be operated from the surface. The old Cornish pump was of this description. The engine was placed near the rim of the shaft and long pump rods descended almost to the sump and operated the pump below. This pump would be operated no matter how high the water might rise.

The long pump rods were in the way, and in America this arrangement has not been popular. The tendency has been to put the prime mover near the pump, but that meant keeping the water down below the pumping equipment or losing the use of it whenever a severe flood occurred. At first steam for the engine was passed down the shaft in pipes, but this was not desirable, for an important loss of pressure resulted and, where the shaft was lined with timber, fires were likely to break out from the heat of the steam.

When electricity was introduced it was carried down to a motor, but with electrical machinery placed at such a low level much risk was run that it would be submerged and when the water had been pumped out by some other means the motor might have to be hoisted to the surface, overhauled and baked in an oven to free it from moisture. Consequently some means to prevent the pumproom from being flooded seems desirable. Of course, with much standby capacity and large storage this difficulty might be met. If the pump failed or the water came in too fast for the main pump, another unit that was in condition could be put into operation. In case of a pump failure this might be successful in keeping down the water, but if the inadequacy was due to an excessive flood or if the flood came during a pump failure, then submergence of the pumps might not be avoided. Consequently the difficulty was not satisfactorily solved.

It was from a realization of this difficulty that the submerged pumproom resulted. In *Coal Age* this week D. C. Ashmead describes such a provision. Here the standby capacity is four times as great as that of the pump that is normally in operation; there are two pumps each twice as big as the unit on which the management relies for meeting the daily drainage needs of the mine. Nevertheless this large provision is made yet more ample by providing that until the water rises to the bed 120 ft. above, the pumproom will not be flooded. Even then by erecting a further dam it will be possible to go on pumping, utilizing the area in the second seam as storage for more water.

In August, 1920, the American Institute of Mining and Metallurgical Engineers visited the Athens mine, in the iron regions. The shaft of this mine is 2,489 ft. deep. At the bottom, or 2,400-ft. level, a pump was placed in a chamber to which access was obtained through a steel bulkhead, which, when closed, would make it possible for water to rise 100 ft. to the next level before flooding the pumproom, which could be approached by a "blind or staple" shaft, to use the language of our British cousins. The pipe entered the pumproom through the bulkhead, so that water could reach the pump but not flood the chamber in which the pumping was done. This was described in an article which appeared in *Coal Age*, Vol. 18, p. 532.

In the Gray slope the access to the pumps is not through a staple shaft but by a rock tunnel, but the principle is much the same. It will be noted that the only loss of power incurred by putting the pump thus low arises from friction, for the water entering the pump has the static head of the water above it—whenever it is above it—and so lessens the work that the pump must perform.

For this reason it might seem well to keep the pumproom where it will always be submerged, for by this means no difficulty ever will be experienced in making the pump take water. It will not have to pick up its water, for the water will flow under pressure to it. This advantage, however, has not been used in the Gray slope, but it seems worth considering.

It would seem that the advantage of this system is not confined to shafts. Even in slope mines, and perhaps in some drift mines, it might be used with advantage, not only to avoid starting difficulties but to prevent the flooding of the pumproom. A bulkhead could be placed above the level of the seam ready for use if the mines were completely flooded. Through this bulkhead entrance to the pumproom could be obtained. Should the flood rise above the bulkhead it could be closed and entry be made by a shaft from some higher seam, down which men could be lowered if necessary. With modern electrical equipment, however, it might be possible to leave the machinery to its own electrical devices, especially if the motor were designed so as not to heat excessively even with continuous running. All motors that are needed for pumping where flooding is feared, no matter what the circumstances may be, should be so designed.

THE COAL COMMISSION named by the President to investigate the coal industry in America is pushing forward its work with commendable speed, and promises to make its report before April 1, the expiration of the present agreement. We hope the commission will make its report as short as possible; it can add all the statistical tables it desires. It is most important the public come to an understanding of the coal problem in America, and this understanding can best be reached through a short, concise summing up.—*Louisville Evening Post.*

Zeigler No. 2 Adopts Cage Hoist and Raises Seventeen Tons per Minute with Ease

Cars Hold Five Tons—Seven Dumps Made in Two Minutes—Reciprocating Screen Plate Under Bins Resizes Nut Before Loading—Degradation Returns to Rescreener — Fuel Coal and Ashes Handled by Same Conveyor

By Frank H. Kneeland*
New York City

FROM the standpoint of daily output per single producing mine opening few coal plants can compete with those of the Bell & Zoller Mining Co., at Zeigler, Ill. During the month of March, 1922, Mine No. 1 produced, so far as is known, the largest monthly output of any mine in the world, the total output for the month being 164,109 tons, or an average of 6,078 tons per working day.

Mine No. 1 is an old operation, the shaft having been sunk many years ago. At the opposite end of the town lies Mine No. 2. This is a new development which has been hoisting coal for only about a year. Probably in no coal field in the world is competition more keen, nor is the preparation of bituminous coal carried further than in southern Illinois. Inasmuch as all profit, if any is made, is derived from the larger sizes of coal, every effort is made to keep down degradation. For this reason the practice at Zeigler No. 1 of discharging the coal from the mine cars by means of a rotary dump and hoisting it in a skip has been abandoned at No. 2 mine. This latter operation has self-dumping cages operated in balance in the usual manner.

The coal hoist installed at this mine consists of a pair of 28x42-in. Litchfield engines direct connected to an 8-ft. cylindrical drum. It is fitted with a steam brake and steam-actuated reversing mechanism. The rope is $1\frac{3}{8}$ in. in diameter. The cages are hoisted at this shaft with unusual rapidity. What the hoistman might be

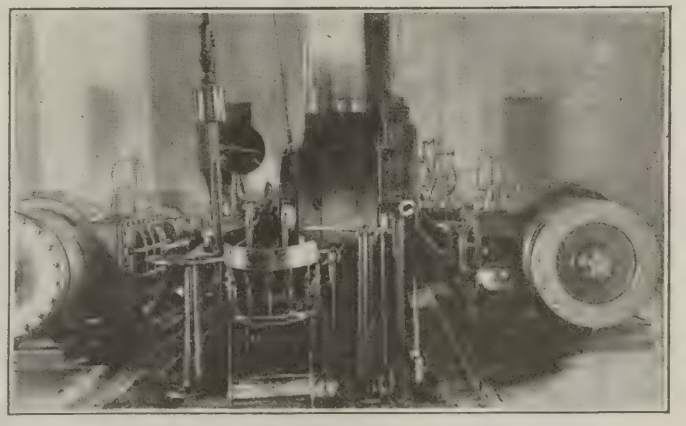

FIG. 1—HOISTING ENGINE, ZEIGLER NO. 2
This engine is lifting cages containing 4.9 tons of coal at such a speed that seven dumps are made in 2 minutes—that is $3\frac{1}{2}$ cars are discharged per minute. This is done without any unusual effort but owing to the lack of men it is not possible to feed the coal continuously to the shaft so that the output of over 8,232 tons per day which this speed of hoisting would indicate can be attained.

*Associate Editor, *Coal Age*.

NOTE—Headpiece shows foot of hoisting shaft, Zeigler No. 2. This view is taken from the empty-car tracks of the bottom. The car on the left is on the cage, which is standing at the landing. The car on the right is on the far side of the shaft ready to pass onto the cage when it descends.

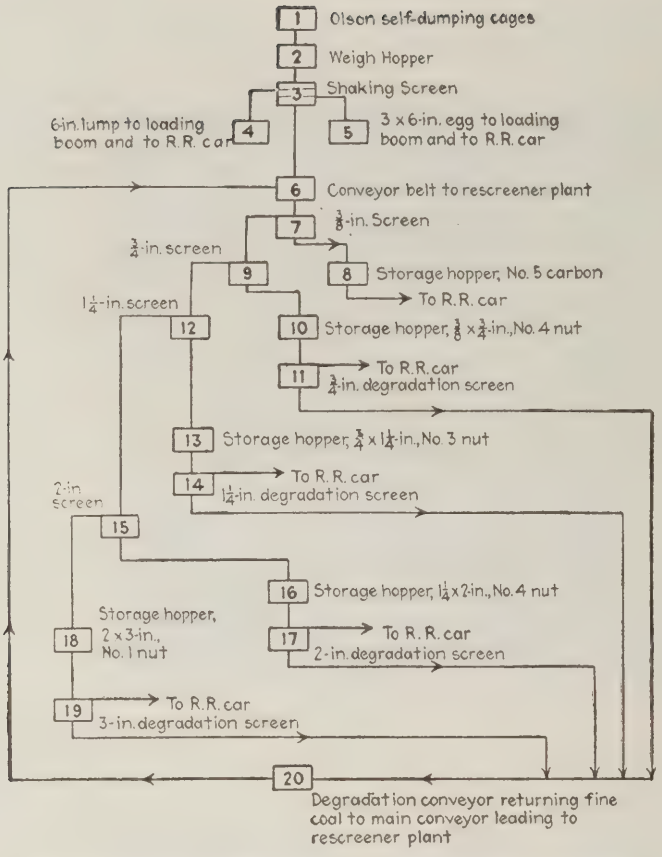

FIG. 2—FLOW SHEET OF TIPPLE AND RESCREENER

In the tipple is made a lump coal which passes over a 6-in. screen and an egg which passes through that screen and refuses to pass through one with 3-in. openings—3x6-in. egg, it is termed. In the rescreener is made nut coals which will be held on 2-in., 1¼-in., ¾-in. and ⅜-in. screens and a fine coal known as No. 5, or carbon, that passes through the ⅜-in. openings.

able to do if he tried his utmost is unknown, but in the course of an ordinary day's run an average of seven dumps in 2 minutes or, what is the same, of 3½ cars per minute, is not in the least uncommon.

When it is considered that the cars are of 5 tons nominal capacity and normally are loaded each with about 4.9 tons of coal, the daily possibilities of this mine become immediately apparent. Seeing that this speed of hoisting can be easily attained even though it be for only short intervals under present conditions, it would appear that when both organization and mine are tuned up to "concert pitch," as was Mine No. 1 during last March, the older operation will do well to look to its laurels.

At this operation the usual southern Illinois practice of making in the tipple proper only two sizes—6-in. lump. and 3x6-in. egg—has been followed. The flow sheet, or sequence of operations performed, may be seen in the illustration above (Fig. 2). The process of preparation is as follows: From the Olson self-dumping cages (1) the coal is discharged to a weigh hopper (2), from which it is discharged to the shaker screen (3). This screen has two sizes of openings—3 and 6 in. The coal that passes through the 3-in. openings is directed to the conveyor belt (6) leading to the rescreener plant. The coal that passes over the 3-in. openings but through the 6-in. perforations is known as 3x6-in. egg and goes immediately to the railroad car by way of a picking table and loading boom. That portion of the mine product that goes over the 6-in. circular opening of the tipple screen is known as 6-in. lump, and it also is loaded under the tipple after being passed over a picking table and loading boom.

Turning now to the coal that passes through the 3-in. openings in the first shaker, the belt conveyor, to which reference has already been made, delivers this to the rescreener plant, which is a separate building standing at some distance from the tipple proper. Here the coal is passed successively over ⅜-, ¾-, 1¼ and 2-in. screen openings, the five sizes thus made being known as No. 5, or carbon, and Nos. 4, 3, 2 and 1 nut coal.

On either side of the rescreener plant is placed a row of five storage hoppers, each having a capacity of 150 tons. Under each hopper is a reciprocating plate feeder. In all cases except that of the No. 5 carbon this plate is perforated with holes of the same diameter as those over which that particular size of coal was made, the plate thus forming an efficient degradation screen. Obviously the bins containing the No. 5 "carbon" require no such screen.

After passing through the ⅜-in. screen (7) the No. 5 or "carbon" goes to its storage hopper (8) and thence to the railroad car. Material passing over this screen goes to one with ¾-in. openings (9). The coal passing through this screen goes to the No. 4 nut hopper (10) and thence over the ¾-in. degradation screen (11) to the railroad car for shipment. Degraded coal passing through the openings of this screen (11) goes to the degradation conveyor (20), which returns it together with that from all the other degradation screens to the main conveyor leading to the rescreener plant.

Further description of rescreening operations hardly will be necessary, as the various processes are all similar and should be obvious from the flow sheet. It should be stated, however, that the rescreener building stands alongside the power plant and that provision accordingly is made to supply fuel to this plant direct—that is, by a coal spout leading into the basement of the boiler room. Of this arrangement more will be said later.

Two railroad tracks pass beneath the rescreener plant, one under each row of bins. The capacity of each bin (150 tons) is sufficient to assure the prompt loading of any car that may be placed beneath any particular bin. Furthermore, the contents of such a car will be as free from degradation products as it is possible to render it. In general both tipple and rescreener plant are of steel construction, only the floors being of wood. Ample window space gives the tipple plenty of light.

FIG. 3—CLEANING EGG COAL ON THE PICKING TABLE

The front end shows the loading boom to which the table leads and by which the egg coal is taken to the railroad cars.

So much for the coal-preparation plant proper. The surface works at this mine include a power plant, the necessary shops, a wash house, fan and fan house, and the headframe surmounting the man-and-material shaft, together with the man hoist and the structure that houses it. All of these buildings are of a permanent and substantial nature, fireproof materials (except in case of some floors) being exclusively employed.

The power house consists of two distinct units, boiler room and engine room, separated from each other by a partition. The building is constructed of brick, steel and glass and rests on a concrete foundation. In the boiler room six 366-hp. Heine boilers are installed. These are set in batteries of two each and are provided with Green chain-grate stokers. Four of these boilers are set with a height of 7 ft. from top of stoker rail to bottom of front water leg. In the other two boilers the height has been increased to 10 ft., thus affording a larger combustion space between the grate and tubes. When burning a fuel as high in volatile matter as the coals of southern Illinois an ample combustion space is highly advantageous, particularly when the boilers are being forced beyond their rated capacity.

The stokers under these boilers are all 8 ft. wide. Their length in four of the boilers is 9 ft. and in the

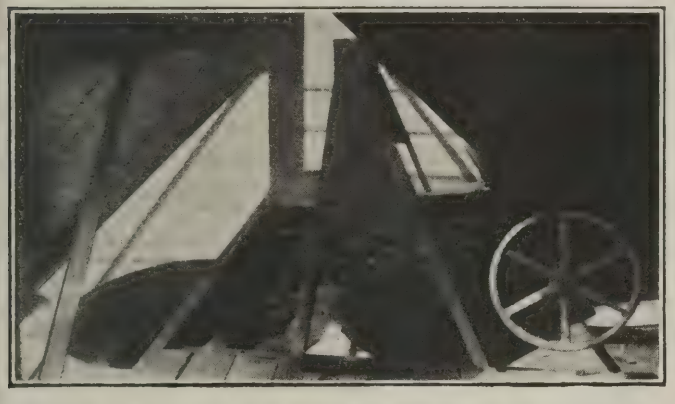

FIG. 4—NUT COAL BEING RESIZED BEFORE LOADING
In the anthracite region the coal drawn from the various bins passes over lip screens to remove degraded material. Soft coal is similarly degraded, and so, at Zeigler No. 2, all the nut bins are fitted at the bottom with reciprocating plate feeders which are perforated so that all material below standard size will be removed. The undersize goes back to the rescreener. The anthracite and the Illinois regions have this in common that in both unusual care is taken to size the coal scrupulously for the market.

other two 10 ft. All the stokers are driven from a line shaft beneath the floor, the eccentric rods extending upward through slots in the floor beside the stoker rails. Two small vertical steam engines drive the line shaft through a belt. Only one engine is required at a time, the other being held as a spare.

Hopper-bottomed overhead steel bunkers supply coal to the stokers through movable downcomer pipes. Reference already has been made to the fact that coal from the rescreener plant is spouted direct into the basement of the boiler room. Here it is delivered to a Peck carrier that forms a vertical loop extending completely around the entire bunker installation. The path of this conveyor is practically rectangular, consisting of two vertical and two horizontal parts. The two vertical parts parallel the two ends of the boiler room; one horizontal part extends above the coal bunkers, the other below and in front of the ashpit doors in the basement. The carrier buckets are so arranged that they will discharge their contents at any desired point.

By means of this carrier, coal delivered to the basement of the building is discharged to any bunker desired. Ashes removed from the boiler ashpits are carried horizontally to the end of the building and then elevated to a point near the top, where they are discharged and spouted to an ash bin outside. From this bin they are hauled away by wagon or truck and are used in grading about the plant, in surfacing the dirt roads in the vicinity or for any other purpose to which they may be adapted. The carrier thus not only fuels the plant but removes the ashes as well, both operations being entirely mechanical.

FIG. 5—ZEIGLER NO. 2, A LEADER IN BOILER PRACTICE
Chain-grate stokers and combustion chambers of the generous height suited to a high-volatile coal such as Illinois produces reduce the cost of power production. In order to make sure that coal will be delivered without interruption even the engine driving these stokers has its spare unit. These boilers have a capacity of 2,196 hp.

Three centrifugal pumps feed the boilers. These are installed in the basement of the boiler room and consist of two Manistee Roturbo machines driven through direct connection by Moore steam turbines; also a similar pump direct connected to a Terry turbine. In addition to these centrifugal units two steam piston pumps have been installed, one of which lifts water from the storage dam to an elevated tank. The other supplies the feed-water heater.

Before being fed to the boilers all feed water passes through a 3,500-hp. open feed-water heater. The two newer boiler units are fitted with a device that regulates the dampers automatically, and it is intended eventually to control the draft of all the boilers in like manner. Natural draft is furnished by a brick stack 13 ft. 6 in. in internal diameter and 225 ft. high.

Within the engine room three generating units have been installed, together with the necessary switchboards, electrical instruments and control devices. These com-

FIG. 6—FORGE SHOP HAS EVERY NEEDED DETAIL
Large cars, machine cutting and large operation are daily demanding more and more of the blacksmith shop. Mule shoeing and pick sharpening made far smaller demands on equipment than does the varied work of the modern shop.

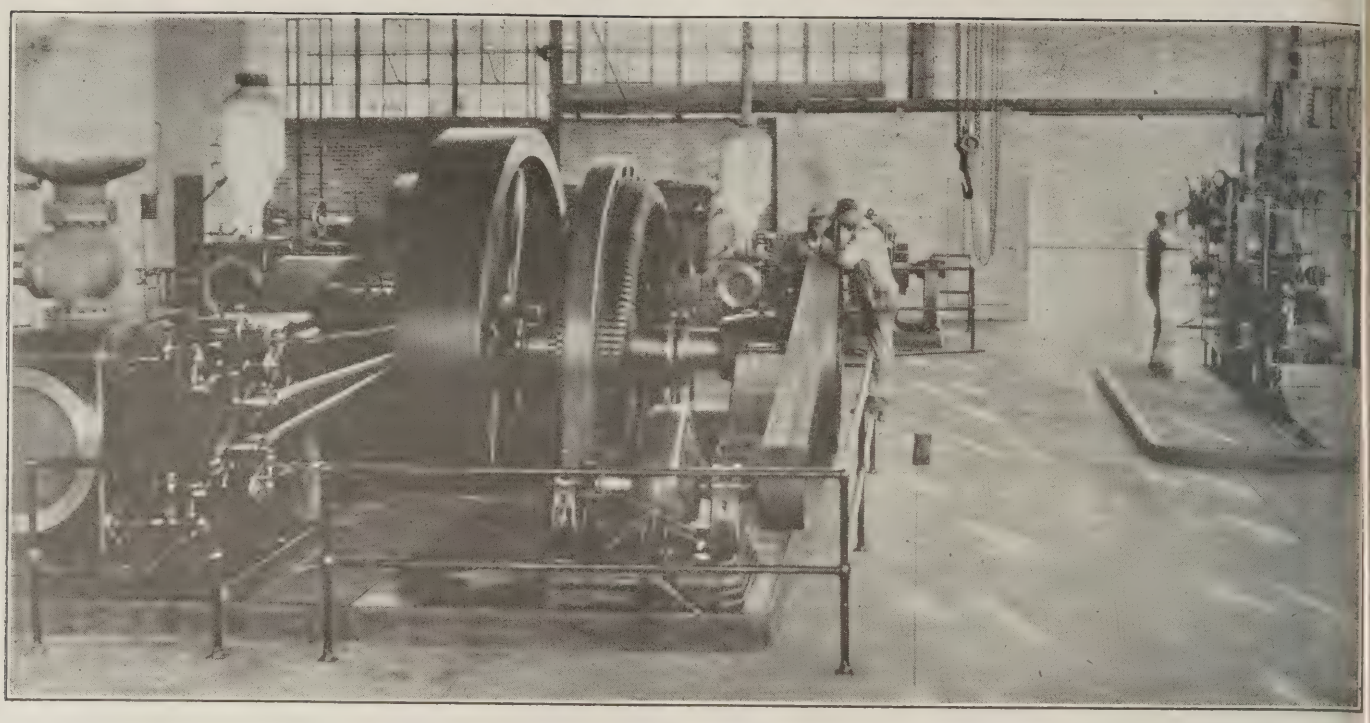

FIG. 4—HIGH-SPEED ENGINES DRIVE ELECTRICAL MACHINES
At Zeigler No. 2, economy in the production of steam is no less marked than the frugality exhibited in the use of it. The three units have an aggregate capacity of 959 kw. They soon will be supplemented by a turbine-driven unit. The two electrical units in the rearground are direct-current generators. That in the foreground is an alternating-current generator.

prise one Sprague 300-kw. 1090-amp. 250- to 275-volt direct-current generator direct connected to a 22x25-in. Chuse non-releasing corliss engine operating at 200 r.p.m.; one 364-amp. 250- to 275-volt direct-current generator direct connected to and driven by a 14x17-in. Chuse non-releasing corliss engine operating at 235 r.p.m.

In the rear of these two units and in the foreground of Fig. 7 stands a 169.5-amp. 540-kw. 60-cycle, 2,300-volt alternating-current generator direct connected to a 28x32-in. Chuse non-releasing corliss engine operating at 150 r.p.m. This unit is excited by a small generator driven by a belt from a pulley mounted on the end of the main generator shaft and overhanging the outboard or pedestal bearing.

Within a short time a large turbine unit will be installed in the rear of the equipment just described. The foundation for this new machine is now being placed. It will occupy approximately the position of the camera when taking the photo reproduced in Fig. 7. A 10-ton hand-operated traveling crane spans the width of the engine room and traverses the building from end to end.

FIG. 8—MACHINE SHOP AND ITS EQUIPMENT
Speedy repairing is one of the characteristics of a modern plant. Some part of the equipment is always needing repair. If it can be adequately and rapidly repaired at the mine the tonnage is maintained. Unfortunately accounting is not readily pushed so far that against every breakdown is charged not only the labor and material of repair but the loss of efficiency that the idleness of the part being repaired almost inevitably occasions. If that charge could be, and were, made, the realization of the value of the repair shop would be driven home with more force.

The shops at this plant, as may be judged from the accompanying illustrations, are substantially built, well arranged and adequately equipped to perform the general run of work that must be done at an operation of this kind. The wash house is 40x180 ft. in ground dimensions and is fitted to accommodate 1,000 men, about 700 now being employed above and below ground at this operation.

The air-man-and-material shaft is located about 700 ft. from the main shaft. It is served by an 18x36-in. steam hoist fitted with a 5-ft. cylindrical drum and a hoist rope 1¼ in. in diameter. The fan supplying air to the mine is a 16x5-ft. Jeffrey machine, direct-connected to a 20x24-in. Chandler & Taylor engine. It is now operated at approximately 90 r.p.m. and supplies about 175,000 cu.ft. of air per minute.

The real criteria by which any industrial or other plant must be judged are the results accomplished. Thus far Bell & Zoller plant No. 2 has not had an adequate opportunity to show of what it is capable. The plant as a whole is new and not as yet thoroughly "limbered up." The morale of the organization, however, appears to be excellent and all concerned seem to take a wholly justifiable and commendable pride in the speed with which coal can be brought to the surface. As remarked earlier in this article, therefore, when opportunity comes and both equipment and organization are thoroughly "in tune," plant No. 1 may have to do its utmost if it is to continue to be the world's champion coal producer.

ONE OF THE CONGRESSMEN points out that a great part of our country has been settled by immigrants. He fails to make mention, however, of the parts that have been unsettled by them.—*Manila Bulletin.*

Cutting Derailment Costs by Suitable Precautions

One-Inch Is Maximum Permissible Wear for Locomotive Tires—False Flange Compels Wheel to Climb Over Switch Rails and Frogs—Projecting Lips for Bumpers—Protecting the Legs of Steel Sets—Track Rerailers Desirable

By Alphonse F. Brosky*
Pittsburgh, Pa.

OF ALL the questions put by mine engineers perhaps the most persistent of all is: What is the maximum permissible wear of locomotive tires, and what is the effect of inadequate locomotive clearance on the behavior of a mine locomotive? Cases are known where locomotives have been derailed because their tires had worn down to such an extent that the clearance between the underside of the locomotive and the rails no longer was sufficient.

Where this happens a piece of slate or a hard lump of coal on the roadway may raise the locomotive from the track and cause it to leave the rails. This is more likely to occur where the track rolls, for in that event the front end of the locomotive tilts upward or downward as it travels along the roadway. By better locomotive design the dangers of derailment arising from the faults of the machine itself are being eliminated. In consequence practically all new locomotives are safe in this respect. In the past a few locomotives were designed without enough underclearance to permit the machine to run safely even when the wear on the tires still was within reason.

Knowing this, inquiry was made of mechanical engineers at mines as to the wear on a locomotive tire which might be considered reasonable, economical and safe. The reports received from many of those consulted indicated that they were practically unanimous in the belief that a locomotive never should be allowed to lower more than 1 in. by the wearing of the wheels—that is, the web radius should be reduced no more than that. Practice from mine to mine varies but little in this regard. Tires are permitted to wear ½ in., more or less, before the first turning. Then they are worn ½ in. more, thus lowing the locomotive 1 in. Occasionally it is the practice to allow the tires to wear down still more, in which event they should be turned twice. This practice is neither economical nor safe, however.

Should Wheel Tires Be Turned or Scrapped?

The superintendent of an isolated mine plant should analyze his tire cost, including all items of expense, not omitting the cost of turning. If he does so he may find that it is more economical to scrap a tire after it has become worn down ½ in. than it would be to have it turned for further use. This would be true where the mine is not equipped with a machine shop capable of doing the work. A general superintendent in an outlying district informs me that experience has taught him that it is unprofitable for him to turn down his tires. The cost of removing and sending them away for turning almost equals the cost of a new tire.

On well-kept haulage roads where no obstructions project above the level of the rails, a well-designed locomotive is in little danger of rubbing along the bottom, even though the tires be allowed to wear thin. The locomotive designers with one exception, and then only in exceptional cases, have taken care in all instances to provide clearance that will suffice as long as the tires are not allowed to wear abnormally.

Even though the motors on locomotives are hung

*Assistant Editor, *Coal Age*.

Note—The headpiece to this article shows the tracks leading from No. 1 and No. 2 drifts of Mine No. 214 of the Consolidation Coal Co., at Roberts, Ky. The rail weighs 56 lb. per yard and is laid on 6x6-in. ties set on 18-in. centers. The diamond crossover, however, is laid on 8x8-in. ties so closely placed that they almost form a floor under the crossing. Between the guard rails and the true rails is placed a 2x2-in. steel piece which gradually rises toward the crossover. The flanges of the wheel ride on this bed of steel, thus elevating the tread of the wheel above the rail. In this manner the wheel, resting on its flange, has continuous support. In passing over such intersections the wheels do not bump in the customary manner. In fact the locomotive rides so easily that the passage over the intersection is hardly noticed by the motorman. Tracks like these are not excelled on the best of railroads.

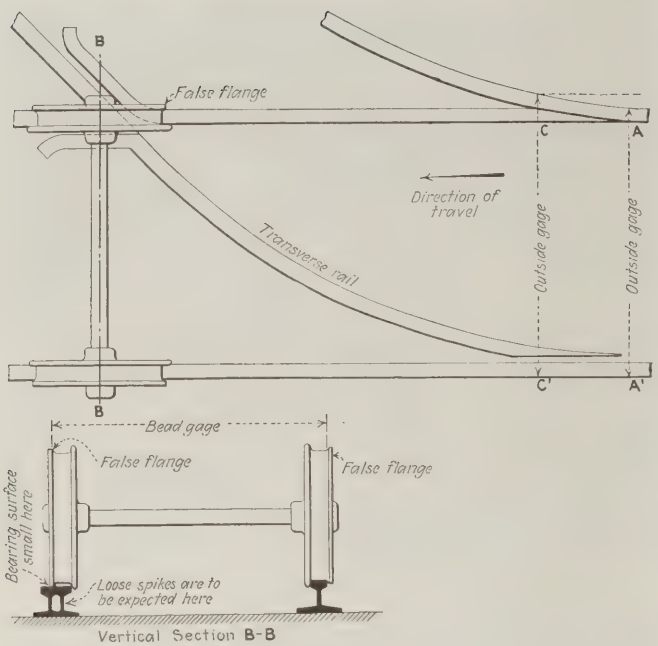

FIG. 1—GROOVED WHEEL CROSSING A SWITCH

With a grooved wheel, the false flange has to climb over the switch rail and the frog. Before it rises it becomes wedged by the recession of the surfaces against which the false flange rubs. This tends to loosen or upset the rail and to bring a thrust on the wheel. If the wheel is loose it comes off; if tight, the pin that holds it may be sheared. If it is on a locomotive and has a loose tire, that tire may be pulled off. When it finally climbs, the wheel so raised is higher than that on the other side, and the thrust is reversed. The climbing is injurious to the rail, and the running of the thin bead on the top of the rail or frog soon wears it down, a most injurious action. All of which explains why grooved wheels are to be avoided as much as possible and why some means of readily turning them in service or out of service at minimum labor continually is being sought.

low and tires wear or are turned until they are thin, reducing the underclearance as much as 1½ in., this should not cause the locomotive to rub on the bottom, provided the roadway is clean. It is not safe to lay too much stress on the cleaning of the roadway, however, for a fall of rock or coal from a car or from the roof may make the roadway, however well kept, far from clean at the point where it occurs. With decreased clearance the chances of the lowest point of the locomotive touching the transverse rail at a switching point are greatly increased.

Locomotive clearance always must be figured from the elevation of the top of the rail and not from its base. The locomotive may pass readily above the ties and yet come to grief at the transverse rail of a turnout.

The clearance between the top of the rail and the frame on low types of Westinghouse-Baldwin mining locomotives is from 4 to 4½ in. With the standard type the clearance is 6 in. However, the distance between the lowest part of the motor and the top of the rail is between 2 and 2½ in. From 1 to 1½ in. is the maximum depth to which the tire should be allowed to wear.

Deeply grooved locomotive tires are likely to cause accidents not on the straight track but in transferring at switch points and to a lesser extent in crossing over points of narrow-angled or large-numbered frogs and also in passing crossings. Not only do grooved tires cause derailments but they also damage the track accessories, and these in turn damage the locomotive, and thus the injury is intensified. The wheels of the rolling stock, even if they have no false flanges, will wear both themselves and the track.

Each time a wheel passes over from a wing to the point of a frog, or vice versa, a gap must be crossed. The passing of a wheel either of a mine car or a locomotive once over such a gap will do little damage, but during the life of rolling stock the wheels pass many times over these gaps. Although the mine cars and locomotives travel on straight track most of the time, the ill effects of turnouts and crossing on wheels are greater than the ordinary wear on a straight track. In Fig. 1 a mechanical analysis is made of the action of grooved tires at frog and switch points. A little study here will make clear the mechanics involved.

Referring to the plan, let us assume that a pair of locomotive wheels with deeply grooved tires moves toward the frog. As the wheels advance from AA' toward CC' the outside gage of the track widens though the wheel gage is constant. At AA' the outside gage of the track probably is equal to that of the distance between the false flanges, but as it widens this ceases to be true.

If there were no false flanges the wheels would travel along without any resistance except that normal to straight track, but as there is a false flange the wheel must rise so that the bead on the tread of the wheel can lift itself onto the top of the receding rail of the side track, and before it does that it becomes wedged and has to force itself clear. The same condition also is apparent when crossing from the straight rail to the frog as at B. Traveling at speed under such conditions one wheel is suddenly lifted, and that action imparts a sudden side thrust to the wheels. The action is similar to that in passing over a stepped track joint. Thus it is that grooved tires rapidly wear away the switch points. Passing in the other direction, that is from the rear of the frog to the point or from the frog toward the switch, the false flange will strike the incoming rails or the inside edge of the frog and produce a heavy thrust to the right.

Cannot Raise Switch Point to Spare Rail

To prevent derailments at such places the switch points might be raised so that they would stand at the height of the groove, but this practice would be impracticable for the grooving is not the same on all the equipment passing over the switch, and where the wheels are not so badly grooved the whole weight would fall on the point of the switch, with injurious results. The better plan is to keep the wheels reasonably free from false flanges. It is obvious also that the raising of the switch points would cause a thud when the wheels struck them, and the effect of such an elevation of the wheel would be to injure the switch point and cause the same side thrust as before.

When a grooved locomotive wheel passes over a frog point it is lifted up so as to permit the bead on the tread to cross the outer wing of the frog. In doing so the contact surface between the wheel and the rail is reduced considerably. If the frog is made of ordinary steel the false flange will rapidly wear a groove across the frog point. At best it is a difficult matter to anchor frogs and maintain their alignment. With grooved locomotive wheels it is still more difficult to prevent the frog being thrust out of line.

Unless locomotive tires are allowed to wear to a point where they have no strength, they will rarely come off at an inopportune moment. It is, it is true, a possible source of accident, and care should be taken to insure tight fits when putting tires on a wheel. Should the tire be shimmed, too much filler should not be added,

as it will put a strain on the tire which may fracture it and cause it to loosen or even come off.

One company reports an interesting accident. A gathering locomotive ran over its electric cable and severed it, and in doing so a small notch was burned in the web of the tire. The wheel rested on the exposed wires only a short time, but it was sufficiently long to weaken the tire at that point, so that not long afterward it opened up.

An instance is reported where a loose tire barely failed to cause a fatal wreck. A main-line locomotive intending to go north crossed a switch leading east. The frog engaged the loose tire and carried it toward the east. The locomotive, however, continued on its way north until it came to a curve going northwest. Not being held to the track, due to the absence of one of its flanges, the motor continued in a northerly direction and ran into the rib. The motorman jumped before the collision occurred, but two timber sets were knocked out and enough rock to fill fifteen cars fell on the roadway.

Loose wheels on mine cars are conceded to be exceedingly dangerous and without doubt cause most of the wrecks in mine haulage. These wheels will slide off at the slightest provocation when crossing a frog. Wheels rarely become loose on mine cars if they are equipped with roller bearings because the retaining pins rarely if ever break and fall out. One company reports that over a period of two years it did not have a single loose wheel.

Where mine cars are equipped with plain-bearing wheels a competent mechanic should grease the cars so that at the same time they may be inspected. Too many companies make the mistake of employing a boy or man who lacks the mechanical ability to do this work satisfactorily. One consulting engineer recommends that the scheme described in *Coal Age*, Aug. 10, 1922, page 197, be used as a means of making the detection of loose wheels absolutely certain. A similar arrangement could be rigged up underground where the lighting is insufficient for a really efficient inspection.

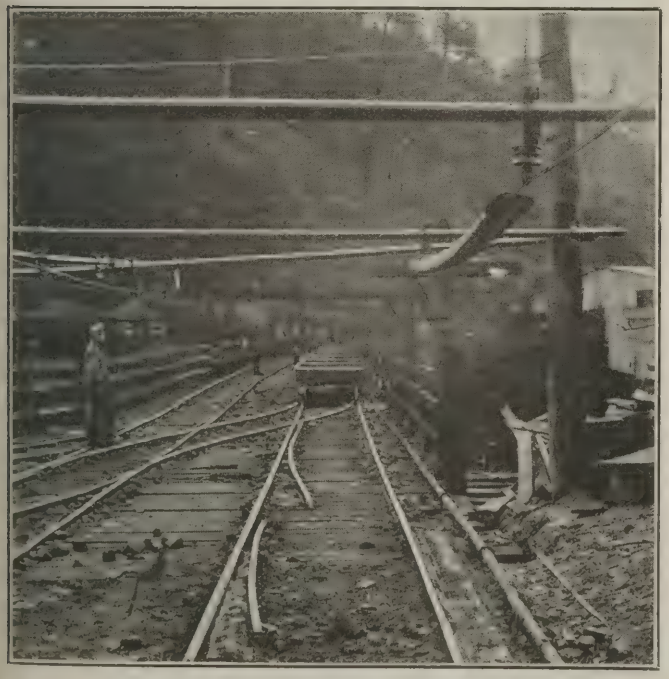

FIG. 2—TWO RERAILERS TO PROTECT PIPE LINE

These rerailers can be seen near the left rail. A plank which rises toward the throat of the rerail raises the wheels so that the treads mount the rail instead of pushing it over. A plank on the far side of the right rail similarly lifts the wheel on that side so that its flange can cross the rail and drop into place. In this way the cars are prevented from breaking the pipe line or from dropping over the side of the bridge.

FIG. 3—FOUR PERMANENT RERAILERS UNDERGROUND

These rerailers replace cars automatically as the trip proceeds on its way. The illustration is from a photograph taken at Mine No. 294 of the Consolidation Coal Co., Jenkins, Ky. The rerailers retrack cars both on coming and going trips. Note the wood inclines which raise the wheels gradually to a height at which their flanges or their treads can move readily over or onto the rail, respectively, and drop into place.

Advances in the design of bumpers both for mine cars and locomotives have done much to eliminate the derailments at curves and to prevent one bumper from climbing over another. Especially is this true of locomotive bumpers. If not provided with any other device the modern bumper is furnished at least with an overhanging lip on its upper edge. This keeps the mine car nearest the locomotive from climbing over the bumper of the latter, an occurrence that is likely to injure the motorman.

The bumper sometimes has a series of horizontal slots or shelves and is made unusually deep so that a locomotive with safety may haul mine cars of varying bumper height. In adding new mine cars to those already being used at his mine, the operator should make sure—if a new design is adopted—that these new cars will function well with the cars with which they will have to be hauled. A change of mine-car proportions usually necessitates a change of bumper design.

In an effort to secure greater safety for the motorman in hauling a trip of cars and the snapper in coupling up, and also to create a bumper which may be used over a period of years with few or no repairs, the Elkhorn Division of the Consolidation Coal Co. at Jenkins, Ky., is co-operating with the Huntington Car & Foundry Co., in the development of a bumper for its main-haulage motors.

The locomotive on the left in Fig. 6 is equipped with two 1,800-lb. cast bumpers which no doubt will stand hard usage. Each bumper is approximately 18 in. deep and has three slots making it adaptable to three types of mine car, each having a different height of bumper. A projecting lip prevents the mine car next to the locomotive from climbing, which action, if permitted, would endanger the life of a motorman whenever the motor is coupled to the trip with the control end to the rear. The face of the bumper unlike that of older types, is curved as it should be to facilitate the negotiation of curved track.

The bumper on the motor standing to the right in the

FIG. 4—STEEL SETS WITH FOOT PROTECTION

To protect the steel sets from being knocked out of place by derailed cars or locomotives, bottom separators have been provided. The roof at this point is bad; consequently over the 8-in. steel girders which span the roadway are two courses of locust tie timbers with cross members. The sets are placed at 6-ft. centers and have 4-in. H-section posts. The bottom separators are of 6x6-in. oak. The clearance on the right is 3½ ft. wide. As the illustration shows, the company has a great belief in clean haulageways and ample clearance. Still more protection would have been given the legs if they had been mounted on a concrete wall as high as or higher than the sides of the cars.

same illustration is practically of similar design though its composition is different. Its weight is two-thirds that of the solid bumper as it is built up of wood and iron. Which type ultimately will be adopted as standard depends entirely upon their comparative utility. As with all that is new the bumpers shown must go through stages of evolution before the best possible design is adopted.

Try as one will one cannot wholly prevent derailments. One can only hope to make wrecks less frequent. Consequently, the next consideration should be to limit the damage that might be done should such a derailment occur. Perhaps the most serious secondary danger is that of dislodging the timbers by which the roof is supported. When this occurs the loose rock which these timbers support is almost certain to be brought down.

Saving Posts from Blows of Derailed Cars

Discretion dictates that legs which rest on the bottom of the roadway be placed in niches so that they will not project beyond the surface of the rib. Where the roof load is no greater than may be carried safely by the coal itself, short blocks resting on the coal may be used to support the crosspieces. This will keep the footing above the danger zone which lies between the bottom of the roadway and a point slightly above the top of the mine car.

Steel timber sets find their greatest use at turnouts, and it is just here that a derailment is likely to occur. Anchoring the legs on concrete piers placed in the bottom will not always prevent these posts from being dislodged when hit by a derailed motor. The safest practice is to build a concrete wall approximately the height of the mine car and to rest short legs on this.

When a long trip of cars, either of loads or empties, travels along the roadway, the motorman being on one end and the snapper on the other, the mine car in the middle of the trip may leave the track and ride the ties without either man becoming aware of that fact. Sometimes the motorman can feel by the jerking of his locomotive that a car in the trip is derailed, but this is rare.

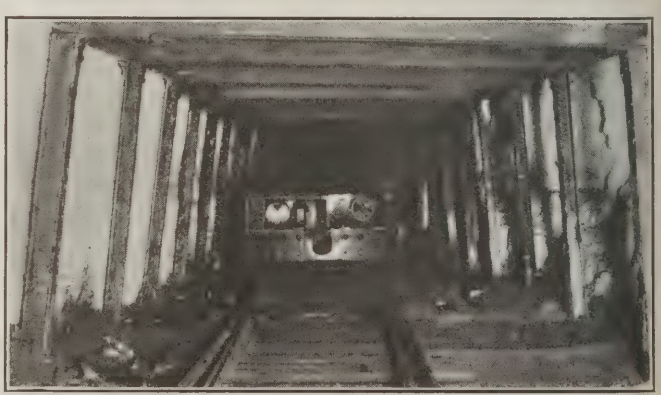
He may ascribe the "hard" running to a lack of lubrication or to some other condition and remain content until a pile-up occurs. A derailed car often will continue to run in this manner for long distances, being held from further displacement by the cars on either side of it. Several cars may leave the track before the motorman discovers that something is wrong.

Nowadays permanent rerailers are being introduced at points in the mine where cars are most likely to leave the track unnoticed. These form an integral part of the track itself. Sometimes they are placed on the outside of the track and sometimes on the inside. Occasionally they are placed on both sides. They automatically rerail mine cars and are equally effective in guiding the wheels of a locomotive back to the track, using its own power for that purpose.

When these rerailing devices are used an elevating platform is placed between the wing flanges and the straight track. This usually is of wood and is arranged so as to rise to the rail level at the point where the rerail and the other rail come most closely together. This is known as the "throat." In this way the wheels will be at an elevation that will make rerailing easy and automatic.

The headpiece of this article and Fig. 2 will give an excellent idea of the manner in which these operate. The latter illustration portrays a simple rerailer located on the approach to a tipple bridge. As arranged, it offers protection to the pipe line and bridge railing shown to the right of the track and automatically rerails any car that might get off on that side. A similar arrangement placed on the right-hand side of the track would rerail the cars if off on the other side. Setting a guard rail on the bridge is a precautionary measure that will prevent injury should the rerailer fail. Though it will not lift a car to the track, it will keep it away from the bridge railing for some distance.

A more effective rerailer is seen in Fig. 3. This is located in mine No. 204 of the Consolidation Coal Co., at Jenkins, Ky., on the load haulway off the First East, and therefore is not far from daylight. Its location is logical. Ten-ton locomotives ply this haulageway. Com-



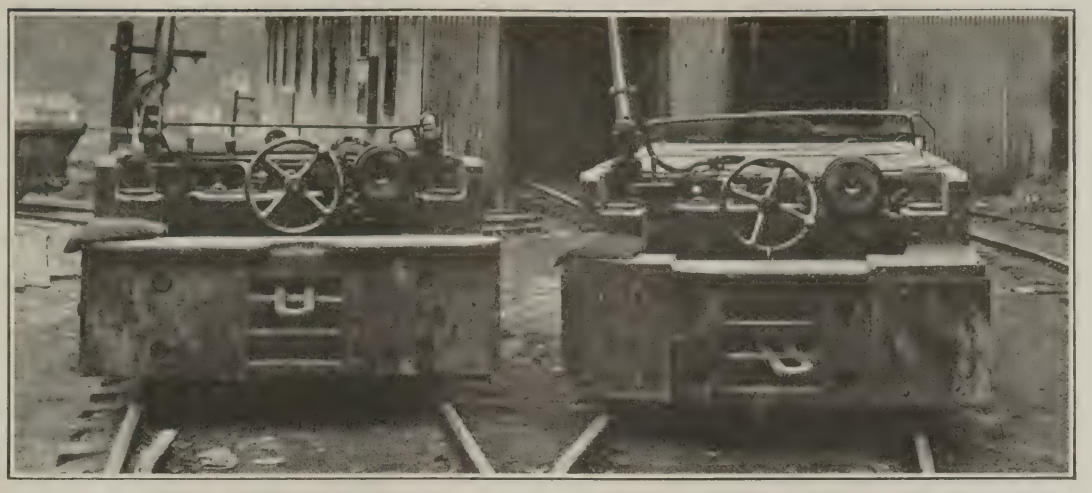


FIG. 5—STEEL SETS IN CONSOLIDATION MINE 204

The switch in this roadway is thrown parallel to the track and not at right angles to it, thereby enabling the snapper to throw his switch without danger of being crushed by the locomotive. He feels assurance when this kind of a switch is provided, and he throws it full over, saving a derailment and injury to the switch rails. With the other kind of switch he may be precipitated in front of the locomotive.

FIG. 6

Two Bumpers

The locomotive on the left has two 1,800-lb. cast bumpers 18 in. deep. It has three slots, making it adaptable to three types of cars, each with a different height of bumper. The purpose is to prevent the car from climbing onto the part of the locomotive reserved for the motorman and the controller. The bumper on the motor to the right is of a similar design but is two-thirds as heavy.

ing from the First East entry a heavy grade favors the loads. Checking and stretching the trip on such a grade is likely to cause the derailment of a car; but the entire trip will be sure to leave the mine on the steel after passing through this rerailer. On several occasions a 10-ton motor has left the track and without apparent difficulty has been put back in place with the aid of this device.

Though derailments usually occur where conditions are such as to favor them they are likely to happen even where they are least expected. Motormen insist now that their motors, regardless of type, shall carry rerailers. Efficient companies are equally as insistent on this score, maintaining that time should be saved that is now wasted in looking for the paraphernalia wherewith to retrack the locomotive which has left the rails.

The use of props, ties or a jack in this work is to be discouraged if possible as that practice is fraught with danger to life and limb. No man is a coward nor is he lacking in devotion to duty when he refuses to hold a tie or prop in position for the rerailing of a locomotive. Unusual conditions surrounding the scene of the derailment may make it impossible for a locomotive to regain the track on its own power. Another locomotive, a block and chain or a Sylat post puller will aid, the last two by holding what ground is gained by the locomotive moving under its own power. Extreme care should be taken by the men to keep out of the direct path of the chain for the latter is sure to act like a whip whenever it breaks.

Some Mines Fix a Certain Maximum Grade

Coal companies do not insist with sufficient determination on the proper installation and maintenance of their track equipment. This is just as important as good material, for complaints against the material in use when investigated usually prove that the fault lies not in faulty fabrication but rather in improper installation and maintenance.

At some mines a maximum grade is adopted and, if the coal dips at a heavier grade, the entry is raised or lowered by taking bottom or bringing down top. Where a mine is advanced correctly the daily mileages of gathering locomotives are fairly uniform. In justice to the loaders working the several mine sections, mine-car distribution should be equitable. To accomplish this end, gathering locomotives having longer hauls should care for fewer working places than those having short hauls. In most mines this practice prevails.

Under uniform conditions no more than two types of locomotives should be used, one for main haulage and the other for gathering. When this is done repairs are more easily made, fewer repair parts have to be kept on hand, and the management is better able to judge by comparison what comprises a fair day's tonnage for each locomotive, remembering always that main-haulage and gathering locomotives must each be compared with other units of the same class.

By having locomotives of a construction that the repair forces understand and by having plenty of repair parts always available, safety and economy in haulage is the better insured. Track should not be laid with rails of too many different weights. The usual three classes—heavy for the main roadways, medium for cross or room entries and light for the rooms—should be strictly followed. Transferring from one size of rail to another is better accomplished by switches than by joints, and if this plan is adopted derailments will be fewer.

Track Standards Should Be Established

If some one method of laying track is adopted the tracklayers will readily adjust themselves to it. Even when they are not required to follow any plan in laying turnouts they unconsciously will attain to some uniformity of construction throughout the mine. But scientific layout nevertheless is advisable and should be required.

The use of parallel-throw switches throughout the mine not only protects the lives and limbs of snappers but also preserves the switch points from damage and eliminates derailments of the locomotive. In setting a normal-throw switch, which is thrown toward the track, the snapper has little time until the locomotive is upon him. Thus hurried he may not close the switch completely. In consequence the motor will damage the switch point and on rare occasions will climb over it. The parallel-throw switch, because it is always in the clear whether opened or closed, imparts a confidence to the snapper that moves him to set it correctly.

Mine-car inspection is one of the most important elements in attaining freedom from haulage accidents. Some superintendents are beginning to sense that fact and at least one is a "stickler" for thorough mine-car inspection. The highest paid employee on the outside of his mine is none other than the man who inspects the mine cars. That employee is not even burdened with the job of lubrication. As the mine cars are equipped with roller bearings and do not need frequent oiling he can concentrate his attention on inspec-

tion. Cars are lubricated every ten weeks, but by someone else.

Brakes are placed on mine cars for a purpose. If we may judge from the indifference which some officials exhibit as to the condition in which they are kept, brakes are merely added through a whim of the manufacturer. How often has it happened that a snapper reached for a brake to check the speed of a mine car only to find that it did not take hold. The result usually is a collision. Only infrequently is there a derailment. But because no cars leave the track is no reason why the brakes should not be carefully watched and cars with poor brakes taken to the repair shop, for the shocks sustained by cars having ineffective braking equipment will inevitably bring them there before long.

Price Fixing by Employers and Workers

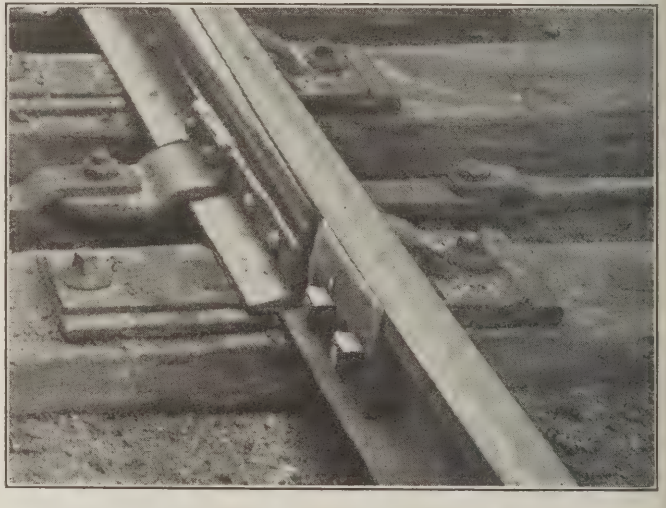
TWO unusual cases have recently developed in which the fact was brought out that employers and employees had entered into mutual agreements the effect of which was to maintain or inflate prices. The workers' interest in entering into such agreements, it is fair to assume, is the maintenance or increase of their wages.

In one of these cases a federal grand jury in Cleveland, Ohio, on Jan. 5, handed down indictments, charging violation of the Sherman Anti-Trust Law on the part of sixteen members of the Wage Committee of the National Association of Window Glass Manufacturers and the National Association of Window Glass Workers. Immediately following the indictments the federal judge sitting in Cleveland issued a temporary order restraining the manufacturers and glass workers from carrying out the terms of what has been called their "wage agreement."

The basis of both the indictments and the temporary injunction is the allegation that the manufacturers and their employees had negotiated an unlawful contract with the apparent purpose of curtailing the output of hand-blown window glass and of raising prices. A part of the proof in the case was an alleged agreement which bound certain companies to close their plants in order to curtail production.

In a somewhat similar case the Federal Trade Commission has been asked to proceed against the Photo Engravers Board of Trade of New York and the New York Photo Engravers Union No. 1. As summarized by the commission, the facts as alleged in this case are that there exists an agreement between the board and the union "to adopt and maintain a schedule of uniform prices below which no members of the board will sell photo-engraving products." A joint commission of the board and the union, the complaint states, sees that the agreement to this effect is carried out.

On its part the union, it is set forth by the commission, requires its members to cease working for any member of the board who fails to maintain the prices agreed upon. In order that such prices may be established, the union itself prepared a chart of prices to be used by all manufacturers of photo-engraving products, and bound its members to work only for members of the board who maintain such prices. The situation is thus presented of workers instructing their employers what prices to charge and forcing all consumers to pay them.



The result of the agreement, according to the complaint made public by the Federal Trade Commission, is "that practically all manufacturers of photo-engraving products in the city of New York have been compelled to join the Photo Engravers Board of Trade, giving the members of that board a monopoly of the business, and enabling them to maintain prices and eliminate competition." In the light of labor's condemnation of employers for alleged practices of this nature it will be interesting to hear counsel for the Engravers' Union defending its action at the hearing the commission is to hold on this complaint.

The Cleveland and New York cases differ in that in the latter the element of unfair competition is introduced, while in the Cleveland case the proof related mainly to attempts to limit production. But the objectives of the two agreements seem to have been essentially the same.

The attack made upon agreements of this character is likely to discourage similar attempts to maintain prices, even if, as in the photo engravers' case, the objective is mainly to enable employers to pay high wages. —*The Index.*

Curved Plate Protects Switch Points

NO PART of tramroad and railroad equipment is more ill-used than the switch point. Constructed so that it tapers to a mere sliver at the end, it is ill-adjusted to bear the excessive wear to which it is exposed. Consequently it has occurred to someone to attach to the rail by bolts a guard plate with a gently rounding edge, placing it two inches from the switch point. Its purpose is to prepare the wheels which pass it, on their way toward the switch, to meet the switch point without any sudden thrust. The wear thus comes on the protector and not on the switch. This guard plate is small and made of manganese steel. It is shaped to conform to the head of the railway rail. The heads of the bolts rest in a channel plate made to conform to the space between the head of the rail and the flange.

GUARD PLATE WHICH REDUCES WORK OF SWITCH

When a wheel has passed such a guard plate as is illustrated above, it is rightly directed and rightly placed to take the switch point, which has nothing to do whatsoever except to hold what has been gained. The weight on the wheel is carried, at least in the main, by the straight rail. Hence the switch point becomes largely functionless and lasts accordingly.

This device has been extensively used on railroads and has given excellent service, lengthening the life of the switch points, especially in unfavorable locations. As it is curved in both directions it does not interfere with traffic on the straight track. This device is known as the Mack Switch Point Protector and is manufactured by J. R. Fleming & Son Co., Scranton, Pa.

Submersible Pumproom Will Not Flood Till Water Rises One Hundred and Twenty Feet Above Pumps

No Water Admitted to Pumproom Except What Passes Through Pipes—Dams, Proof Against 300-Ft. Pressure, Isolate Pump Chamber — Water Is Stored in Coal Seam 10 Feet Below

By D. C. Ashmead*
Kingston, Pa.

OPERATORS in the anthracite region not only have to handle the water passing through the measures but are forced frequently to cope with great inrushes of surface water, which in many cases drown out the workings and preclude operation for days at a time. Usually only parts of the mines are thus affected, but it not infrequently happens that almost the entire workings are inundated.

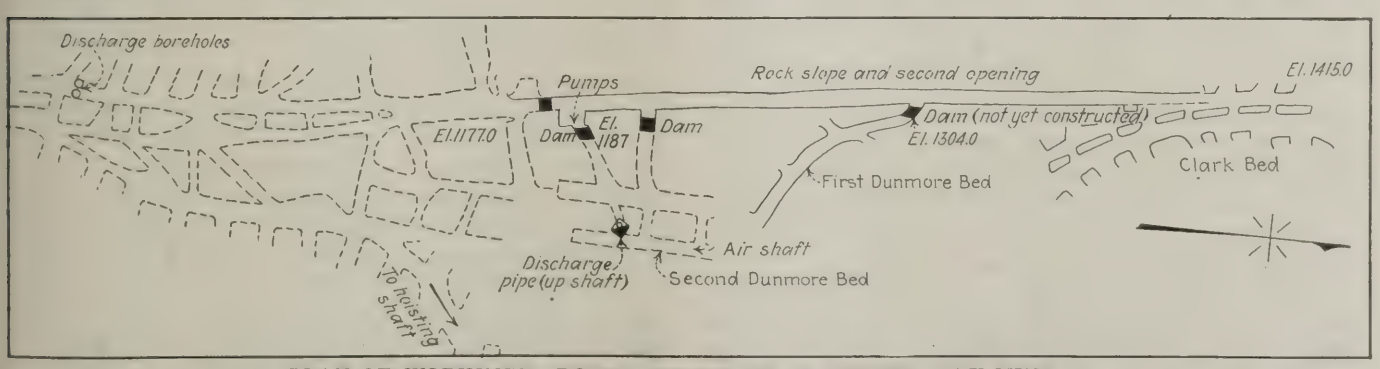
These inrushes of water come from various sources. Thus a cloudburst may cause runs and creeks to flood over their banks and flow down shafts or slopes into the mine workings. Sometimes such flood waters break into the mine through cave holes and cracks. Then again prolonged rains cause water to enter the mines through caves and surface fissures. Workings at other times break through to old operations which are filled with water.

When these floods occur pumping is not the only cost. In the long run the loss of time due to the flooding of the workings probably will be a more expensive item, though the fact that it is not charged to drainage may cause that fact to be overlooked. When mines are closed down the overhead cost must be met without any tonnage being obtained over which to spread it, and at an anthracite mine the overhead charges are necessarily heavy.

Flooding Causes Delay in Operation

The coal companies, realizing that the flooding of mines is a costly misfortune, are taking every precaution to prevent such flooding and to provide for the speedy dewatering of the workings should a flood occur. The best method, of course, is to try to prevent such inundations, but in many cases this is impossible. The next best course is to provide a means for dewatering that will interfere with operation as little as possible.

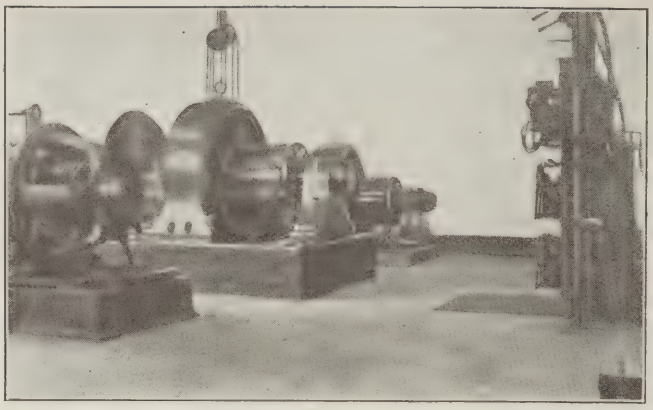
*Assistant Editor, *Coal Age*.



The Pennsylvania Coal Co. has provided "concealed," or submersible, pumprooms, that can be operated regardless of the condition of the workings. These pump chambers are so constructed that when the water level in the mines rises, they will not be flooded. Even when water spreads through workings around and above them the pumps still are dry and can be reached and tended in perfect safety.

At Forest City a colliery named after that town is operated by the Hillside Coal & Iron Co., which in turn is affiliated with the Pennsylvania Coal Co. In the past this mine has been visited by floods, and sad experience has convinced the coal company that the pumps must be protected so that in case of a flood they can be reached and operated as usual.

Slope, a Water-Tight Passage to Pumproom



From the Clark Bed at an elevation of 1,415 ft. a rock slope extends down to the Second Dunmore bed at an elevation of 1,187 ft., or 228 ft. below. At the foot of this slope is placed the pumproom. The only way in which water could enter this rock slope from the Second Dunmore bed would be by rising 117 ft. It would then reach the First Dunmore bed at an elevation of 1,304 ft. This bed has only one opening into the rock tunnel. This can be sealed by a dam; thus water cannot get into the rock slope till it has risen in the mine 227 ft. and utilized a large excavated area in the first Dunmore Bed for storage.

At the foot of the rock slope are two openings into the Second Dunmore bed. These have been sealed by watertight dams that will withstand a head of 300 ft. The bottom of the Third Dunmore bed is 10 ft. below that of the Second Dunmore, and a seal is placed between the rock slope and this seam of coal. The old workings in the Third Dunmore bed serve as a sump for the pumps. The suction pipes pass through the dam

PLAN OF WORKINGS AROUND PUMPROOM IN FOREST CITY MINE

Beneath the pumproom floor is the seam known as the Third or Lower Dunmore and roadways which have been driven in it afford sumpage for 17,600,000 gallons. As soon as the water rises above the level of the pumproom floor, without, however, entering that chamber, it floods the Second or Middle Dunmore bed, and before it is 3 ft. above the floor it has attained a storage capacity of 34,500,000 gallons. This only partly exhibits the water storage available at this installation, for the water will not begin to flood the pumproom (except it be through the measures) till it has risen beyond the first Dunmore bed to the Clark seam, 228 ft. above the pumproom floor. The bottom of the hoisting shaft is at an elevation of 1,185 ft.

INTERIOR OF SUBMERSIBLE PUMP ROOM
In front are two 6-stage centrifugal pumps of 2,000-gallons-per-minute capacity and in the rear a centrifugal pump capable of lifting 1,000-gallons-per-minute.

into the pumproom, and the discharge pipes on their way to the surface pass out through the dam to boreholes and to the airshaft.

In the pumproom are two six-stage centrifugal pumps that will each lift 2,000 gallons per minute against a 300-ft. head. They are each driven by a 250-hp. motor and have a 12-in. suction and a 12-in. discharge. There also is another centrifugal pump having a capacity of about 1,000 gallons per minute. This is driven by a 100-hp. motor. A traveling crane with a 5-ton chain block handles the pump parts when repairs are necessary. None of the piping is above the floor of the pumproom.

This submersible chamber theoretically would be free from danger of flooding even when the water rises 228 ft. above its floor, but practically it might not be possible to rely on so great an immunity. But even figuring on 120 ft. the mine would have to be almost entirely flooded before the pumproom would be lost, for the Clark bed, that would be still untouched by the rising waters, is already worked out. In ordinary times the smaller pump can handle the water the mine makes, but in the spring, when the water is high, one or both of the larger pumps are used.

Improved Business Conditions of December Sustained During January

FIGURES which recently became available, according to the Survey of Current Business, prepared by the U. S. Bureau of Census and printed in *Commerce Reports*, tend to confirm previous reports of almost uniformly favorable business conditions during December, last. This month, which always shows some let-up in industrial movements, was characterized by well-sustained activity, with increases over the preceding month in many instances. The improvement in the transportation situation enabled heavier shipments to be made in many commodities. This improvement was particularly noticeable in building materials.

Retail sales were of record proportions, and current reports indicate that sales were well maintained during January. Prices remained relatively stable, with further increases in agricultural products, thus bringing these more nearly into line with other commodities.

The outlook for the immediate future, so far as domestic trade and industry is concerned, is particularly bright. The disturbed foreign situation has so far appeared to have but little effect upon such delicate indicators of industrial and commercial wealth as the stock and bond market.

Consumption of cotton by textile mills in December totaled 527,945 bales, or about 50,000 bales less than the high record made in November. Exports of cotton also declined, with a total of 607,853 bales in December, compared with 858,337 bales in the preceding month. Stocks of cotton increased slightly at the mills but declined at warehouses. The total in both positions at the end of December amounted to 5,996,000 bales, compared with 5,919,000 bales a month before, 6,945,000 bales a year ago, and 6,875,000 bales at the end of 1920. The prices of both cotton and cotton goods increased during December. Middling upland cotton at New York averaged 25.7c. in December, the highest since September, 1920.

Receipts of wool in Boston were particularly heavy, due to marked increase in the amount of foreign wool. The prices of wool and woolen goods showed little change from the month before.

Production of pig iron and steel ingots was well maintained during December. The output of pig iron by merchant furnaces increased somewhat in December, while sales and unfilled orders showed a large increase over November. Prices of all iron and steel products tended somewhat lower during December.

Production and shipments of steel sheets declined slightly in December, but sales and unfilled orders showed marked increases.

Automobile production showed only a slight seasonal decline in December.

The prices of most non-ferrous metals increased. Copper production showed another increase, reaching 103,845,000 lb. in December, the largest for any month since 1920.

Contracts awarded for building in the 27 Northeastern states during December totaled 38,603,000 sq.ft. of floor space, valued at $215,213,000, making this month the highest December on record. A year ago the corresponding figures showed 35,272,000 sq.ft. of floor space and a value of $198,518,000, while in December, 1920, only 14,004,000 sq.ft. was contracted for, with a total value of only $100,145,000. Residential buildings in December, 1922, accounted for 24,950,000 sq.ft. of floor space and $120,139,000 in value. Educational building was the only group showing an increase over November.

Some seasonal declines were shown in the production of lumber during December, although in every case the movement was far in excess of a year ago. Shipments were well maintained and in many species were larger than for the preceding month.

The production of face brick increased over November. Stocks and unfilled orders also were larger. Shipments and new orders for enamel sanitary ware were distinctly larger than in the preceding month.

On the whole, construction costs declined slightly after an uninterrupted rise for many months.

The Department of Labor wholesale price index showed no change in December, remaining at 156, the same as in November. Slight increases in farm products, food, cloth and clothing, chemicals, and house furnishing goods were offset by declines in fuels and metals. Dun's index number also showed no change, while Bradstreet's declined one point. The retail food index increased again, reaching 147, the highest for any month of 1922.

Problems of Operating Men

Edited by James T. Beard

Width of Rooms Not a Tonnage Factor in Mining

Remarkable Record of Two Miners Starts Discussion—Do Wide Places Increase Daily Output Per Man?—Citations from Different Workings

SOME time ago I recall reading with much interest a short article by L. F. Klingensmith, of the Potter C. & C. Co., operating at some point in Pennsylvania (Vol. 22, p. 676). The article was entitled, "Driving Wide Rooms," and its writer was desirous of ascertaining what effect the driving of wide places had on the daily output of coal, per man.

The article did not seem to attract the attention that it should have received from the readers of *Coal Age*. In a later issue, Dec. 28, p. 1041, I. C. Parfitt lays much stress on certain physical conditions existing in the seam, claiming that these have a greater effect on the output, per man, than the driving of wide places.

Remarkable Record of Two Sturdy Miners

This discussion was suggested by Mr. Klingensmith, after reading the account in *Coal Age* (Vol. 22, p. 216), where two miners, working for the Standard Island Creek Coal Co., at Cora and Taplin, W. Va., respectively, loaded what was practically a gondola each day, for thirteen consecutive working days, one man loading 469 cars, holding 656½ tons and the other 459 cars, holding 596¾ tons in the same period.

There is no getting away from the fact that this is certainly a remarkable record, made by two sturdy individuals whom it could hardly be hoped would represent the average of the coal miners working in our mines today. If it were possible for any mine official, by making a visit to these plants and studying their conditions and plan of operation, to encourage his own miners to even approach this record, the time would be well spent.

Claim Not Supported by Facts Stated

It appears that one of these miners worked in a place that was 36-ft. wide, while the other was driving two places, each 18 ft. wide, both of the men working in 4-ft. coal under practically the same conditions. The latter instance, however, does not appear to lend support to the suggestion that driving wide places is a material factor in increasing the daily tonnage per man.

With Mr. Parfitt, I am inclined to think that, aside from their physical strength, the records of these two men were influenced more by the conditions under which they worked. Loading 469 cars in thirteen days shows a daily car supply of $469 \div 13 = 36$ cars, which certainly is going some for a gathering motor, or any other system of gathering haul, assuming that the motorman or driver was serving several other places in his section.

It may be, however, that every advantage was afforded these two men by giving them all the cars they could load. In my opinion, the question of car supply is one of the most important factors affecting a man's daily tonnage, under otherwise normal conditions.

Width of Rooms Should Seldom Exceed 25 Feet

Looking backward in my own experience, and comparing results under some of the large producers where it has been my fortune to work, I recall no instances where the rooms were double-tracked. If my memory serves me rightly the conditions varied from rooms 12-ft. in width, driven on 100-ft. centers, with 88-ft. pillars between them, in some mines, to 22-ft. rooms, driven on 50-ft. centers, with 28-ft. pillars between them, in other places.

Besides these exceptionally large producers of coal, I could name instances of almost every imaginable system of working and ranging from places just wide enough to get a mine car in, to others where the long-wall face was 100 yd. in length.

Allow me to say that, in all my experience, I have never seen a largely producing coal mine where the results depended on driving wide rooms. As a rule, when the width of rooms exceed 25-ft., it is because of a specially favorable mining condition with respect to the roof and floor, and the height and quality of the coal. Under ordinary conditions, I may say further, that the driving of rooms of a greater width will generally mean the taking of a gambler's chance.

Pikeville, Ky. GEORGE EDWARDS.

Waste in Mining

Growing need of measures being taken to conserve coal supplies—Waste of coal compared with waste of timber—Many foremen to blame for wasteful practices.

TIMELY attention has been drawn to the unwarranted waste of coal in the methods of its extraction, in the letter of C. W. Atkins, *Coal Age*, Dec. 14, p. 959. I am very much in sympathy with all that he has said regarding inefficiency in the mining of coal.

Indeed, the reading of his letter has taken me back to experiences that are all too common in coal-mining practice. Owing to their important bearing on economic conditions, these should have been investigated long ago and the proper remedies applied. Mr. Atkins has spoken my mind wholly in emphasizing the need of conserving this portion of Nature's resources.

By way of comparison, our friend has spoken of the steps taken by the government, only a few years ago, to stop the slaughter of the buffalo, which if continued would soon have meant the extinction of that valuable animal. In a similar manner, I would refer to the steps already taken by the government to conserve all timber supplies, which have been growing more and more scarce, year by year.

Observation shows that what is true of timber as a natural resource, or of the buffalo, is likewise true of our supplies of coal, which are being rapidly exhausted and will take ages to replace.

There are numerous ways in which coal is being lost where it could be saved if more efficient means of extraction were employed and more restricted measures imposed on mine foremen who are so frequently prone to sacrifice large amounts of coal in their endeavors to make records for low cost of production.

In a few instances, such has been the desire to increase the amount of machine-mined coal, in comparison with that mined by the pick, that the foreman would leave the pick stumps and take out only such coal as could be mined with a machine.

One readily recalls that, but a few years ago, the practice of paying for lump coal only, caused the loss of thousands of tons of fine coal and dust, which was thrown into the gob because the miners would load only coal that would pass over the screens. The result was that the mine-run basis of payment was shortly adopted and much of that loss eliminated.

In the operation of small mines, it too often happens that the miners who dig the coal are permitted to go their own way. There is a lack of intelligent supervision and planning of the mine. While, to many, it may seem childish to ask for government restrictions in remedying these matters, to the thoughtful man it appears to be the only way open to avoid the evil.

Mayport, Pa. JAMES THOMPSON.

Inquiries Of General Interest

Port of Entry for Air and Gas in Mine Safety Lamps

In Practical Tests, Air Appears to Enter at Top of Lamp—Effect Is the Result of Rapid Diffusion of Gas About Lamp When Mixture Is Disturbed

THERE has recently arisen, among mining men in this locality, a question regarding the entry of air into a safety lamp, under all conditions of testing for gas in mines. In hopes of receiving a satisfactory solution of the problem and one that will settle our differences of opinion, I am taking the liberty of presenting the proposition to *Coal Age*, for the consideration of the editor and its readers.

Inasmuch as the Wolf and Koehler are the two types of safety lamps used almost exclusively in this district, I ask that the consideration of the question will be confined to these lamps. Without disclaiming the normal ascensional ventilation within a safety lamp, by which air enters the lamp at a point below the flame and passes out through the upper portion of the chimney, our bone of contention is whether, under certain conditions of testing for gas in mines, it is not possible for gas to enter the top of the lamp and give evidence of its presence by the usual flame cap surmounting the lamp flame.

By way of explanation, permit me to say that it has been my lot to have had several years' experience in the gaseous mines of Franklin County, Illinois, and I have handled gas under every known condition. In reference to the question in hand, it is my contention that gas will enter a safety lamp from the top or from the bottom, depending on the conditions under which the test is made.

For example, when using a smooth bonneted Wolf lamp, I have found gas in a small opening in the roof and under circumstances that convinced me the gas entered at the top of the gauze chimney and passed downward to the flame, which was on a level with the bottom of the cavity where an open light was burning at the time.

Now, it is the contention of some that, in the use of either of the two types of lamps mentioned, gas only enters through the lower portion of the gauze or at the small ports of entry below the flame. In reply to this, I ask, "If such be the case, how is it possible to detect a thin layer of gas next to the roof, without tilting the lamp sideways so as to bring the lower ports of entry in contact with the gas?" In my estimation, that must either be done or some device must be used to bring the gas down to the level of the lower ports of entry of the lamp.

On other occasions, I have found small gas feeders coming from the floor when the gas would readily manifest itself in the lamp, by giving a gas cap on the flame of the lamp as the latter sat on the floor. At the same time, when the lamp was raised 2 ft. above the floor, there was no indication of gas, the gas cap then disappearing from within the lamp. This convinced me that, in this case, the gas entered the lamp through the lower ports below the flame.

As a further test, in support of my theory that the gas may enter the top of the lamp when the test is made under conditions that would favor such entry, I used a Koehler safety lamp having a corrugated bonnet. Entering a place where gas was to be found at the roof and holding the lamp upright, I raised it to a point where the top of the bonnet was but a few inches below the roof.

A test was now made with the Burrell gas detector, by holding the end of the tube on a level with the top of the lamp bonnet on the left. The test showed the presence of 1.7 per cent of gas and a faint gas cap was clearly discernible within the lamp. At the same time, a second test taken 10 in. below the first showed no gas present in the air. Also, lowering the lamp to 10 in. below its first position, gave no indications of the presence of the gas, the gas cap then disappearing from the lamp flame.

Trusting that this communication will be taken in the spirit in which it is offered, which is to lead to a better understanding of the conditions surrounding the testing for gas by safety lamps, I would like to ask for the opinions of *Coal Age* and its experienced readers regarding this question. FRANCIS DEVLIN.

———, Ill.

We shall be glad to have the expression of opinion of firebosses and others who have had long experience with safety lamps. Our own experience, in testing for gas in mines, is that the best results are obtained where the circulation within the lamp is wholly ascensional, the gas-charged air entering at the lower ports of entry below the flame and, passing upward through the combustion chamber, escaping through the gauze chimney of the lamp.

In explanation of the test described by this correspondent, we would suggest that it was the result of the rapid diffusion of the gas into the air, a few inches from where it escaped from the strata. By reason of this rapid diffusion, the percentage of gas was too small to give any indication, either on the lamp flame or by the use of the Burrell gas detector.

In testing for a thin layer of gas, at the roof in a mine, the common practice of the most experienced firebosses is, while holding the safety lamp in an erect position, to disturb the layer of gas by blowing slightly against the roof, thus causing it to descend to the flame of the lamp. We have every confidence in the ascensional circulation of air within a safety lamp affording the most reliable means of testing for gas.

Examination Questions Answered

Miscellaneous Examination Questions

(Answered by Request)

QUESTION—*(a) Compute the lifting power of an 18x36-in. engine, steam gage pressure 110 lb. per sq.in., the diameter of the winding drum being 6 ft. (b) If this engine is geared, by a 12-in. spur on the crankshaft, to a 6-ft. gearwheel on the drumshaft, what would be the lifting power at the circumference of a 6-ft. drum?*

ANSWER—(a) The sectional area of an 18-in. cylinder is $0.7854 \times 18^2 = 254.47$ sq.in. In estimating the lifting power of the engine, the total pressure on the piston is $110 \times 254.47 =$ say 28,000 lb., or 14 tons. Applying this total pressure at right angles to an 18-in. crank, gives for the turning moment at the center of the crankshaft $14 \times 18 = 252$ in.-tons. The lifting power at the circumference of a 6-ft. (72-in.) drum is, therefore, $252 \div 36 = 7$ tons.

(b) The diameter of the gearwheel on the drum being 6 ft. and that of the spur on the crankshaft 1 ft., this engine is geared 6:1, and the lifting power, at the circumference of the drum, in this case, is $6 \times 7 = 42$ tons.

QUESTION—*How many pounds of water is a good average to evaporate from 5 lb. of coal?*

ANSWER—Assuming a coal having a calorific value of, say 14,000 B.t.u. per lb. and evaporating water from and at 212 deg. F., corresponding to 970.4 units of evaporation, the theoretical weight of water evaporated by 5 lb. of coal is $(5 \times 14{,}000) \div 970.4 =$ say 72 lb. Much will depend on the type of boiler, heating value of fuel and manner of firing. Boiler practice gives efficiencies varying from 3 to 7 per cent. A fair average evaporation in coal mining practice may be taken as, say $0.05 \times 72 = 3.6$ lb. of water.

QUESTION—*On what is a safety valve's area based?*

ANSWER—This is hardly an intelligent question. The area of a safety valve will naturally be less, the higher the steam pressure desired. The area is estimated on the steam pressure required and the weight hung on the lever, multiplied by its distance from the fulcrum, and that product divided by the distance of the valve-stem from the fulcrum. Thus, if the diameter of the safety valve is 2 in., its sectional area is $0.7854 \times 2^2 = 3.14$ sq.in. Then, for a boiler pressure of 150 lb. per sq.in., the upward pressure on the valve is $150 \times 3.14 = 471$ lb. Assuming a weight of 50 lb. and a distance of 4 in. from the valve-stem to the fulcrum, the distance of the weight from the fulcrum, in order to blow off at a pressure of 100 lb. per sq.in., is $(471 \times 4) \div 50 = 37.68$ in.

QUESTION—*How would you fire a boiler to obtain the greatest number of heat units from coal fuel?*

ANSWER—In practice the method known as "coking the coal" gives the most uniform heat in the furnace, and is less wasteful of the B.t.u. in the coal. In this method of firing, the fresh coal is spread evenly over the fire, after first remaining a brief time in the fore portion of the firebed, where it is piled and becomes heated before being spread over the hot fire. By this method the alternate cooling and overheating of the boiler plates is prevented. It is important, in firing a boiler, to adjust the draft so that the weight of air passing through the fire shall be only sufficient to burn the coal. Where more air is admitted to the firebed the effect is to chill the fire and much heat is carried into the furnace flue.

QUESTION—*Name and describe the nonexplosive gases met with in coal mines, giving their symbols, properties, atomic weights and specific gravities.*

ANSWER—The common mine gases that are nonexplosive are the carbon dioxide resulting from the complete combustion of carbonaceous matter, in every form, constantly taking place in the mine, due to the breathing of men and animals, burning of lamps and powder, decaying of timber and evaporation of acid waters. The other nonexplosive mine gas is the nitrogen of the air, resulting from the depletion of oxygen, due to various forms of combustion and absorption by the coal. These gases are both colorless and odorless. Carbon dioxide has a slight acid taste. They are both extinctive gases, contain no free oxygen and will not support life. Though not poisonous, carbon dioxide has a toxic effect on the human system. It suffocates when breathed, by excluding oxygen from the lungs. The atomic weight of carbon dioxide is half its molecular weight, or $\frac{1}{2}(12 + 2 \times 16) = 22$; and that of nitrogen 14. The specific gravity of carbon dioxide is 1.529 and that of nitrogen 0.971.

QUESTION—*In an airway 5 x 11 ft., there is passing a volume of 23,925 ft. of air per minute; what is the velocity of the air current?*

ANSWER—The sectional area of this airway is $5 \times 11 = 55$ sq.ft., the velocity of the air current is, therefore $23{,}925 \div 55 = 435$ ft. per min.

QUESTION—*If there are 76 men working in the mine and the fan is producing 15,000 cu.ft. of air per minute, the sectional area of the airway being 64 ft., how many air splits will be necessary?*

ANSWER—The West Virginia Mining Law (Sec. 17) provides that not more than sixty persons shall be permitted to work in the same air current, except by special permission of the district mine inspector, should he consider it safe to employ a larger number, not exceeding eighty men, in a single split. To comply with this law two splits of air will be required in this mine, unless, in the judgment of the mine inspector, it is safe to work the 76 men in a single split.

W. Va. University Mining Course Not "Brief" but School of Mines Is Needed

WEST VIRGINIA may not now have a school of mines, but the state and the coal industry are proud of the coal-mine engineering course offered by the College of Engineering of West Virginia University.

A news story in *Coal Age* of Jan. 11, 1923 (page 68), with reference to an address by Governor E. F. Morgan and to a letter from R. M. Lambie, Chief of the State Department of Mines, advocating that West Virginia have a school of mines, said that "though West Virginia is the second largest coal producer in the United States, it has no school of mines and only one institution offering a course in mining and that only a brief one."

A score of friends of the mining course at West Virginia University have written *Coal Age*, pointing out that though they do want a school of mines, because the mining industry in their state is of sufficient importance to warrant such a separate college, no one should conclude that the work of the State University is lacking in serving its mining students or that the course is in fact "only a brief one." A catalog of the University furnished by Prof. A. C. Callen, who heads the mining course, shows that the mining students are given two years of general engineering in common with those studying other branches of engineering, as electrical and mechanical. The mining course as such is two years, being the third and fourth of the whole course.

The point made by the West Virginians is that they have a good college of mines in conjunction with their university, but that they believe the importance of the mining industry in their state warrants a separate and larger school of mines.

West Virginia University has had for 16 years the four-year course in mining engineering described above; the university also gives a six-weeks summer course. There also are evening schools conducted under the direction of the university, which have an average attendance of about 800 men. In addition, the New River State School at Montgomery has a two-year course in mining engineering.

At the same time West Virginia has the distinction of being one of two states (the other being Indiana) out of twenty-four states with an annual mineral production valued at more than $40,000,000 without a "school of mines" or a separate mining building. New Jersey and Alaska are without colleges offering mining courses.

The establishment of a school of mines was recommended by R. M. Lambie, chief of the Department of Mines, in a letter he sent to coal operators in West Virginia. In an address delivered before the Kanawha Coal Operators' Association at Charleston, Dec. 2, 1922, Governor Morgan, after saying that West Virginia stands second among the states in production of coal mines—exceeded only by Pennsylvania—says that "no state with an annual production in excess of $100,000,000 is without a college giving courses in mining engineering, and these states all have 'schools of mines' or separate mining buildings, with the exception of West Virginia, which has a mineral production of about $400,000,000. West Virginia should no longer lag in the performance of the duty it owes to the thousands engaged in this great industry in making provisions for the proper training and development of persons desiring to enter this field of endeavor, so that the highest efficiency may be attained."

Chief Lambie writes to *Coal Age* that if the effort to get a school of mines is successful nothing would give him greater pleasure than to see the present personnel of the mining engineering department of the University of West Virginia transferred to the new school, as they are efficient and enthusiastic in their work and cooperate in every way with the mining department.

F. H. Neely, of the Avella Coal Co., at Penowd, Pa., refers to the course given at the university for the past sixteen years and adds: "In addition, West Virginia has nine men engaged in mining extension work, and was one of the first schools in the United States to give a four-year course in mining engineering devoted exclusively to the mining of bituminous coal."

Strong commendation of the work of Professor Callen is contained in letters from Herbert F. Harker, of the Elkins Fuel Co., Morgantown, W. Va., and R. E. Salvati, assistant superintendent, Island Creek Coal Co., Holden, W. Va.

Legal Status of Open-Shop Agreements

INSTRUCTIONS have been issued by the Department of Justice to the United States Attorney at San Francisco to investigate complaints that the Builders Exchange of that city has entered into an agreement not to sell material to contractors who employ only union labor. In this connection the Department of Justice has issued a statement to the effect that the Attorney General had already in a previous instance made the department's position clear that a conspiracy "that has for its purpose the destruction of organized labor is unlawful, no less than is a conspiracy directed against unorganized or open shop labor."

The action taken by the department as to the San Francisco situation is, it appears, based on a ruling made by the Attorney General on July 18, in which he stated that an agreement of the kind said to exist in San Francisco is a violation of the law whether committed by or directed against organized labor. The July ruling was substantially as follows:

That a conspiracy on the part of material dealers not to sell material to a contractor who is not operating under the American plan (open shop) is unlawful.

That an agreement to refuse goods to a contractor who employs only union men is unlawful.

That an agreement to refuse to sell to contractors who are employing more than 50 per cent of union men is unlawful.

That an agreement having for its purpose the refusal to sell to contractors whose employees are union men, and who refuse to discharge a portion of the help and engage in lieu thereof non-union men is unlawful.

While the department's attitude in this matter has not, of course, the status of a legal decision, it clearly indicates the kind of action that the Attorney General is likely to take when his attention is formally directed to agreements or contracts of this character.—*The Index.*

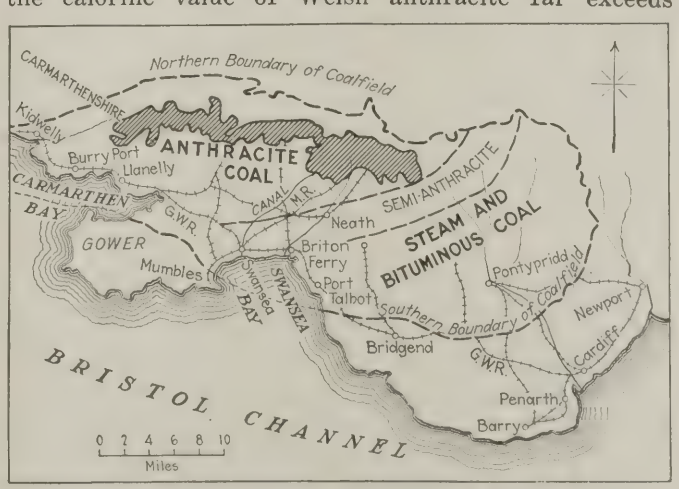
IN THE ARTICLE on page 3 of *Coal Age* of Jan. 4 it is stated that the Nineveh Coal Co. plant was developed to serve a 40,000-kw. plant of the Penn Public Service Corporation. The coal supply of that power plant is, and always has been, received from the No. 5 plant of the Penelec Coal Corporation, located within 500 ft. of the power plant. The error in question arose from a misapprehension of a statement in the original manuscript.

Book Reviews

A Book on British Anthracite and Its Uses

A. LEONARD SUMMERS, who is the author of a book entitled "All About Anthracite," has ventured to write, despite the all-inclusive title of his previous work, another book labeled "Anthracite and the Anthracite Industry" on behalf of Isaac Pitman & Sons, Ltd., of London and 2 West 45th St., New York City. It may be said here and now that this latter book has too large a title, for its remarks on American anthracite are too inconsiderable to be of any value. They cover about five pages and are taken for the most part from *Coal Age* and from papers by D. C. Ashmead and J. Griffen as read before the American Institute of Mining and Metallurgical Engineers. It describes the Chance system as being "the American method of separating coal from slate." Though it is making headway it has hardly established itself so widely; still it may be considered "American" as being different from that in use in any other country.

To the American reader, however, the book may not be less favorably received because it is so exclusively British, for much curiosity has been aroused as to this new rival to American anthracite in the harbors of the East. A few of Mr. Summers' remarks will be of interest. The South Wales coal field, he says, covers "five counties and has an estimated area of 1,000 square miles of which about 15 per cent is under the sea [as against 480 square miles which is the area of the anthracite coal fields in Pennsylvania]. The western portion of the field yields hard anthracite and semi-anthracite, while the varieties of the eastern area are dry steam coal, smokeless steam coal and bituminous coal.



"Swansea is practically the center of the anthracite field, but considerable and valuable seams extend for several miles below the sea across Swansea Bay and in Pembrokeshire. Although the output of Welsh anthracite is only one-twentieth of that in America [Pennsylvania] it has the distinction of being of the finest quality in the world and in world-wide demand. Indeed, in normal times, prior to the Great War, of its modest output of 5,000,000 tons about 67 per cent was exported mostly to countries producing their own anthracite, only about 33 per cent being required for home use. However, Britain has grown wiser of late, and the inland demand has grown enormously.

"Forty companies are working the South Wales anthracite field, which contains seventy collieries, the most important seams being the Big, Stanllyd, Brynlloi, Peacock, Gras, Green, Charcoal, Triquart, Pumpquart and Lower Pumpquart. The largest colliery is New Cross Hands, owned, together with several other mines, by the Cleeves Western Valleys Anthracite Collieries, Ltd., of Swansea. Over 200,000 men are engaged in the whole [South Wales] field, but only 14,000 of them are in anthracite collieries. The total estimated unmined coal is 28,000,000,000 tons, of which 22.27 per cent is anthracite, 30.42 is bituminous and 47.31 semi-bituminous and steam coal."

The remarks of the author on the origin of anthracite are extremely contradictory, and one wonders at times if the author has his facts straight. He declares that there is no relation between the relative disturbance of the strata and the production [formation?] of anthracite. It usually is found that in passing through the South Wales coal fields from east to west the lower beds first exhibit the conversion into anthracite, the change being manifested at successively higher levels going west, until in Pembrokeshire all the seams are anthracite throughout. Yet in contradistinction to the first statement he says that anthracite mining is expensive because the measures are found to be subject to unbalanced stresses which cause the workings to close in after mining. In opposition to the second statement he quotes Dr. Strahan as saying that the Red bed becomes anthracite in a region where seams hundreds of feet below it have not yet assumed that character. The whole subject seems in Great Britain to be still a matter for debate with W. Galloway as protagonist in favor of the more usual theory that the deeper the seam the less the degree of anthracization.

The author quotes Dr. Strahan calling attention to the fact that the South Wales anthracites have a remarkable freedom from ash and that this diminution of ash apparently accompanies the formation of anthracite. "The Ras-las seam has about 7 per cent of ash in the bituminous area in the east of the field, but where it becomes anthracite in the west its ash content falls to only 2 per cent. Thus the percentage of ash diminishes *pari passu* with the decrease of bituminous matter. If the anthracite had been formed merely by the loss of volatile matter from the bituminous coal, the ash content would have increased, not decreased, and the conclusion seems to be that the South Wales anthracites were derived from a purer organic deposit more free from earthy matter than that from which the bituminous coals were formed." In the United States Dr. Strahan would have found that the anthracite coals on the whole have more ash than the bituminous but with some remarkable exceptions, such as the Lykens Valley coals.

Under the side caption "What is anthracite" the author says: "Being virtually pure carbon (the best quality containing quite 94 per cent of that element) the calorific value of Welsh anthracite far exceeds

SOUTH WALES COAL FIELD, ITS PORTS AND RAILWAYS

The shaded portion shows the area being worked by the anthracite collieries but as shown this does not comprise the whole area of the anthracite field. Most of the region is in Carmarthenshire and Glamorganshire, but extensions carry the field into Pembrokeshire to the west. Forty companies with seventy collieries and ten beds are found in the South Wales anthracite field.

that of bituminous, or soft, coals and it contains the least ash (less than one per cent in the higher grades).

It is jet black with a metallic luster. It is very hard, dense and slow burning. It burns steadily with a bright red glow. It gives an intense heat, is clean to handle, continues burning and absolutely smokeless."

He then gives a chemical analysis of the best Welsh anthracite: Carbon, 94.18 per cent; hydrogen, 2.99 per cent; oxygen, 0.76 per cent; sulphur, 0.59 per cent; nitrogen, 0.50 per cent, and ash, 0.98 per cent. The reviewer has been told that anthracite for carbide making can be prepared by hand picking to give some such analysis, which surely is remarkable. Doubtless the analysis given is that of hand-picked samples, but the writer fails to say so.

Much of the book is given to commending the fuel to British users for other purposes than malting (where absence of arsenic favors it), greenhouse work (where its steady burning quality commends it) and the manufacture of producer gas. The British find it difficult to start a fire with it and do not like its absence of lambent flame, the flame which endears bituminous coal to those who use it in an open hearth. The author assures them that it will give twice as much heat as bituminous coal, which may be true when an open fire is used. He deals quite lengthily with the effect of the burning of bituminous coal on the health and comfort of cities and gives some amazing figures, British and American. The book contains 126 pages measuring 4¾x7¼ in., a convenient pocket size.

Modern Researches Into the Nature of Coal

AMONG the brighter minds which are illuminating the nature of coal, F. S. Sinnatt, director of research to the Lancashire & Cheshire Coal Research Association, stands prominently forward though his work is not as well known in this country as it deserves to be. In his "Coal and Allied Subjects" he has brought together the first ten bulletins of the Research Association, which were written by himself and his co-laborers. His publishers are H. F. & G. Witherby, 326 High Holborn, London, W. C. 1.

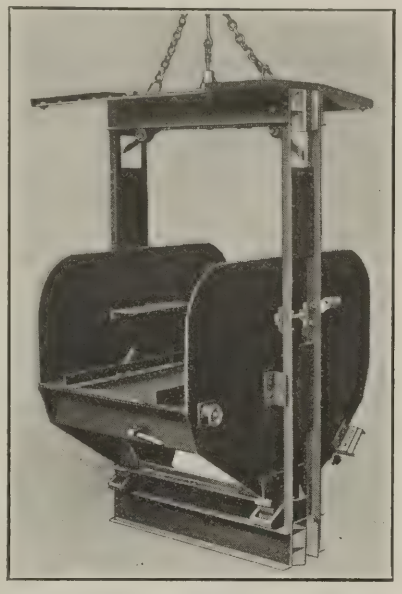
Coal Age has already published one of the bulletins contained in this book, "Coal Dust and Fusain." The little volume opens with a long introduction on organic chemistry with reference to coal, and then discusses sampling, the influence of an addition of inert matter upon the volatile constituents evolved when coal is heated, coal analysis, Hoo cannel, carbon dioxide in coal, inorganic constituents in coal, the agglutinating power curve, stone dust and the calorific value of coal. Its 205 pages, 4¾ x 7¼ in., will be found of much interest and to contain much condensed information.

HENDRICK'S COMMERCIAL REGISTER OF THE UNITED STATES FOR BUYERS AND SELLERS issues its thirty-fifth annual edition for 1923. In this is listed articles for manufacturing and mining purposes to the number of 17,145 ranging from abrasives to zobos, with the names and addresses of the companies manufacturing them for the market. It is remarkably complete, some items taking two or more pages. In addition to this are lists of trade names and an alphabetical list of the firms mentioned. In all there are 2,321 pages, 8x11¾ in., all of which will be extremely interesting to those who desire to get in touch with all the manufacturers of any given product.

Bituminous Coal-Mine Accounting

FULLY equipped by an intensive experience with the New River Co. and the White Oak Coal Co., and with an extension experience gained when acting as secretary of the National Coal Association, W. B. Reed, author of a book entitled "Bituminous Coal-Mine Accounting," is perhaps as well qualified as anyone to write on that subject. Contact with the mines is written large in all those parts of the work where that feature is of value and contact with governmental decrees and business needs is as evident in other parts. One can hardly go wrong in following the advice of a man so well versed and so competent.

Not that all will agree with his dicta. Probably the quarrels between the various C.P.A.'s and between them and the government will never come to an end. The problem of values, for instance, is a mysterious one so long as markets ebb and flow. A man of the old school once declared that mines did not deplete. He could always sell a going mine for more than he paid for it. Another man hoped to find a purchaser to buy his mine because it had so many miles of expensive heading, though the roadways he wanted to sell ran through acres that he had already robbed of their land values. They were a means of access to the acreage beyond, it is true, but the lands would have been better had the coal been unextracted and the coal closer to the tipple. The haulageways were a debit rather than a credit seen in that light, but seen from the viewpoint that they led to coal beyond they were a credit rather than a debit, provided that coal was good and sufficiently extensive, which in that particular instance was not the fact.



Neither of these men would have a leg to stand on in any consideration of real values, but where unreasonable men can differ so radically there is always abundant room for reasonable men to find an issue—and nowhere more than in accounting. Suffice it to say that the stand taken by Mr. Reed in regard to lands and leaseholds is always sound and reasonable and in accord with sane rules of accounting, which have in view not possible later sales or anticipated profits in operating but present selling prices. However much possible profits may influence the purchaser the owner of a property must figure his operation on the basis of retaining intact the value of the property at the price at which he purchased and erected it or in regard to land at its selling value at some subsequent time. He cannot figure on an uncertain future return.

The little details of checking payments for tonnage, yardage and deadwork, of determining daily costs, of tracking waste, of determining the correct royalty payments and of making daily production reports are treated with the sure grasp of a man who has traveled the mines, climbed railroad cars and shifted the pea back and forth on the mine scales.

In this book of 221 pages measuring 5¾x9¼ in., Mr. Reed has included not only the two rejected Federal Trade Commission forms of 1919 and 1920 but also the form submitted to the National Coal Association by a committee of its members and adopted by that body, together with the federal courts decision in the Maynard Coal Co. case, whereby the form of 1920 was made of no legal effect. There are in this book no less than sixty forms for use in keeping company books. The volume is published by the McGraw-Hill Book Co., 370 Seventh Ave., New York City.

All-Steel Self-Dump Cage for Speedy Work

FOR some time the coal industry has been looking for an all-steel cage. The illustration, herewith, shows one designed and constructed by Robert Holmes & Bros. The dumping arrangement is of the rack and pinion type. This provision makes it possible to tie the bottom of the cage so that any strain will be equally divided over the entire cage and not concentrated in any particular point. The top of the cage is tied in the same manner. The platform or body is made of heavy flange steel, tied together with 8-in. beams and the sides are of one piece, thus strengthening the cage and affording protection to men being hoisted or lowered. Two steel hanger-type keepers lock the car in place. They are so arranged on shafts under the platform that they will work either together or individually. When the cage lands at the bottom these keepers are forced downward allowing the empty car to roll off the cage. In doing so, the car wheels strike a lever which releases the keepers. thereby allowing them to return to their original position ready to receive another car. The purpose of having keepers that work independently of each other is to allow the loaded car to pass over the first keepers, locking itself into position as it strikes the second keepers. All the castings on the cage are of steel.

CAGE BUILT ENTIRELY OF STEEL

View is taken from the dump side. The button on the side plate near the floor of the cage runs in the guide which controls the forward movement of the platform in dumping. One of the forward keepers can be seen projecting from the far angle rail.

Electric Bonds Never Cause Rail Breaks

BY O. P. BOVARD*
Mansfield, Ohio

IN THE description of the meeting of the Coal Mining Institute of America at Pittsburgh on pages 1039 and 1040 of *Coal Age*, Vol. 22 (issue of Dec. 28, 1922), the writer of that article says:

"It was stated that at the meeting of the West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers, in Huntington, W. Va., several rails with welded bonds were tested and that it was found that the welding crystallized the rail and weakened it, the rail breaking in every case at point of welding."

Despite the fact that this remark was not put in my mouth and follows in the report a statement made by "another member" I can but feel, in view of the fact that it is recorded that I led the discussion in question, that I should dissociate myself positively with any such point of view, which is contrary in every way to my personal experience and that of the company with which I am associated. In the application of many hundred thousand rail bonds of the welded type on industrial and mine roadways and on electric and steam railways we have never once had a report that a single rail break could be charged to the welded bond.

True in one instance in West Virginia a small rail broke owing to the insertion of an electric bond, this being installed by first burning a hole clear through the rail base with the carbon arc. This treatment injured the rail so severely as to cause breakage, which, however, did not occur at the weld.

It is the policy of practically all manufacturers to recommend that the bond be applied on the head of the rail or on the base. In no case should it be placed on the web, for in that event it is quite liable to start checks in the steel due to expansion of the point under heat when all the surrounding rail is unheated. This practice sets up extremely high stresses which may injure the rail and should, therefore, be avoided.

*Commercial engineer, Ohio Brass Co.

COAL AGE INDEX

The indexes to COAL AGE are furnished free to all who ask for them. The index for the last half of 1922 is now ready for distribution. A copy can be had by addressing a postcard to the subscription department of COAL AGE.

Conference to Consider Standardization of Engineering Abbreviations and Symbols

A CONFERENCE to determine whether unification of engineering abbreviations and symbols should be undertaken, and if so, what the scope of such work should be, has been called by the American Engineering Standards Committee in response to requests received from the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, and the Association of Edison Illuminating Companies. The conference will meet in the Board Room of the American Society of Mechanical Engineers, Engineering Societies' Building, New York City, at 10 a.m., Tuesday, Feb. 13.

As the committee's machinery has been the accepted medium during the last four years for national standardization of raw materials, industrial processes and manufactured products in the engineering field, it was requested to call a conference to consider the standardization of abbreviations and of the symbols used in engineering equations and formulas. Because of the peculiar nature of the subject, and the fact that some of the interested organizations will be unable to have representatives present, the Standards Committee has provided a questionnaire through which such organizations may send by mail, for consideration of the conference, such information as they consider desirable.

The need for the standardization of abbreviations is emphasized by the existing confusion resulting from the variety of symbols for one thing and the multiplicity of meanings of one symbol. The expression "pounds per square inch," for instance, may be represented by at least a half dozen abbreviations. Some English journals use "h.p." for "high potential," whereas in the United States it is generally used to mean "horsepower." Whether or not the letters h.p. should be capitalized or hyphenated is not agreed. The mark ″ may mean inches, seconds, or a quotation. It is used also in mathematical work for distinguishing letters in the same group of quantities, as A′, A″, etc.

Great confusion necessarily occurs because of the use of three or more different symbols for the same thing. The economies which will be gained by eliminating these ambiguities will be great both for the student and for the engineer who must refer to the varied literature of a technical subject. American standardization of engineering symbols and abbreviations should also eliminate the difficulty which foreign engineers have in correctly translating English articles into their own language, when they find widely divergent practices in the use of abbreviations.

The conference on Feb. 13 will take up the following questions for discussion and decision:

(1) Brief review of present practice of representative organizations.

(2) Brief review of practice of international and of foreign bodies.

(3) Shall the unification of abbreviations used in engineering reports, tables, publications, etc., be undertaken?

(a) If so, what shall be the scope of the work?—e.g., shall a broad program covering the general engineering field be undertaken, or shall the work be confined to one or more restricted fields?

(b) If the latter, what shall these fields be?—e.g., civil, chemical, electrical, mechanical or others, including municipal, sanitary, military, railway, mining, architectural, metallurgical, management?

(4) Shall the unification of symbols for quantities used in engineering equations, formulas and tables, be undertaken?

(a) If so, what shall be the scope of the work?—e.g., shall a broad program covering the general engineering field be undertaken, or shall the work be confined to one or more restricted fields?

(b) If the latter, what shall these fields be?—e.g., civil, chemical, electrical, mechanical, or others, including municipal, sanitary, military, railway, mining, architectural, metallurgical, management?

(5) If both lines of activities (items 3 and 4) are to go forward, should they be carried out as parts of a single undertaking or as two separate undertakings?

(6) How shall such unification be related to similar lines of work?—e.g., mathematical signs and conventions used in drawings and diagrams?

(7) Is it desirable that either line of activity be correlated with work on definitions of terms used in engineering practice?

(8) What recommendations, if any, shall be made to a continuing (sectional) committee, should one be organized—e.g., as to orienting the work in such a way as to facilitate international agreement?

(9) How shall the work be organized? For example, is it desirable to make the working committee (or committees) sufficiently large to be thoroughly representative, or is it desirable to keep it smaller, sending successive drafts of standards, minutes, etc., to interested organizations for comment and criticism?

Coke Output Gained Slightly in December

The output of byproduct coke continued to increase slowly in December. The total production was, in round numbers, 3,063,000 net tons, an increase over November of 138,000 tons. The increase was due in part to the fact that December is a 31-day month and November a 30-day month. The ratio of production to capacity was 83.5 per cent against 51.8 per cent in December 1921. This compared favorably with the ratio at times when demand for coke was most active.

Production of beehive coke also increased slightly, the total output being 1,233,000 net tons. The extent of the recovery from the depression that prevailed in 1921 is shown by the fact that the rate of output in December was 167 per cent greater than the monthly average during that year. The present rate, however, is still far behind that during the war years and the two years immediately following.

MONTHLY OUTPUT OF BYPRODUCT AND BEEHIVE COKE (*a*)

(Net Tons)

	Byproduct Coke	Beehive Coke	Total
1917 Monthly average	1,870,000	2,764,000	4,634,000
1918 Monthly average	2,166,000	2,540,000	4,706,000
1919 Monthly average	2,095,000	1,638,000	3,733,000
1920 Monthly average	2,565,000	1,748,000	4,313,000
1921 Monthly average	1,646,000	462,000	2,108,000
1922 Monthly average	2,374,000	669,000	3,043,000
Oct., 1922	2,806,000	876,000*b*	3,682,000
Nov., 1922	2,925,000*b*	1,138,000*b*	4,063,000
Dec., 1922	3,063,000	1,233,000	4,296,000

(*a*) Excludes screenings and breeze. (*b*) Revised from last report.

ESTIMATED MONTHLY CONSUMPTION OF COAL FOR MANUFACTURE OF COKE

(Net Tons)

	Consumed in Byproduct Ovens	Consumed in Beehive Ovens	Total Coal Consumed
1917 Monthly average	2,625,000	4,354,000	6,979,000
1918 Monthly average	3,072,000	4,014,000	7,086,000
1919 Monthly average	2,988,000	2,478,000	5,466,000
1920 Monthly average	3,684,000	3,665,000	6,349,000
1921 Monthly average	2,401,000	706,000	3,107,000
1922 Monthly average	3,411,000	1,056,000	4,467,000
Oct., 1922	4,032,000	1,382,000 (*b*)	5,414,000
Nov. 1922	4,203,000 (*b*)	1,795,000 (*b*)	5,998,000
Dec. 1922	4,401,000	1,945,000	6,346,000

(*a*) Assuming a yield in merchantable coke of 69.6 per cent of the coal charged in byproduct ovens, and 63.4 per cent in beehive ovens. (*b*) Revised from last report.

U. S. Coal Commission to Study Productivity of Labor Under Union and Non-Union Conditions

By Paul Wooton
Washington Correspondent of *Coal Age*

Efficiency and productivity of labor under union and non-union conditions are to be studied carefully by the President's Coal Commission. Public announcement that this will be undertaken was made by Chairman Hammond on Feb. 3. He emphasized that it must be established whether or not it costs more money to produce coal at mines employing union labor than at those who observe an open-shop policy. The efficiency of labor in union mines, he said, is alleged to be 50 or 60 per cent, as compared with an efficiency of 80 per cent in non-union mines. The commission expects to make such a searching investigation of the question as to establish indisputably the facts in that connection.

At the Feb. 3 conference with the Washington correspondents Mr. Hammond reiterated the importance which the commission is attaching to storage. An engineer has been assigned to investigate minutely the matter of local storage at the coal mines. He also said that the commission is more convinced than ever that the railroads must store coal and abandon the policy of commandeering without specific permission in each case. The danger of spontaneous combustion of coal in storage, he said, appears to have been much magnified.

To attempt to divert surplus mine labor to agricultural work during slack business at mines, by the establishment of third-class fares or other expedients was frowned upon by Mr. Hammond, who declared that a way should be found to maintain uniform operation of coal mines throughout the year, thus allowing surplus labor to take permanent employment in other lines. By keeping up the bars against immigration only a few years will be required, he said, until this surplus is absorbed.

Central Stations Would Minimize Coal Handling

A further study of super-power will be recommended by the commission, it was revealed at the conference. While it was admitted that mine-mouth use of coal has a limited application only, due to the difficulty in obtaining condensing water, yet it is believed much transportation of coal can be avoided by well-located central stations.

The commission has given no formal consideration to any plan for facilitating financing of coal storage or obtaining insurance for such coal. In reply to questions, both Mr. Hammond and Dr. George Otis Smith indicated that they see no reason why the commission should concern itself particularly with any plan to make paper covering coal in storage eligible for rediscount at Federal Reserve banks or to take up other details of financing the handling of coal. So far as insurance is concerned, it was suggested that the best insurance for a coal pile is the installation of a crane and a clamshell bucket.

When asked what the commission thought of a plan to pool coal to be handled through large selling agencies, Mr. Hammond declared that such a recommendation likely would lead to a charge of paternalism. He admitted that the commission is very anxious to ascertain why a 5-per cent shortage causes a 200-per cent price advance and he said that the interests making up the coal industry should stop making faces at each other. He would hate to think any branch of the industry is as bad as the others assert that it is.

The commission as yet has no definite idea as to the legislation it will recommend. Every effort will be made, Mr. Hammond asserted, to suggest as little legislation as is possible, just enough to insure the untrammeled play of economic forces. Before public hearings are undertaken, an effort will be made to obtain substantial agreement on as many as possible of the controversial points. By resorting to this process of elimination, he believes the public hearings can be confined to the comparatively few points on which no agreement within the industry is anticipated. By that time the commission will have developed a great many facts for itself and will be in a position to know if witnesses have their facts straight.

During the course of the conference Mr. Hammond and Dr. Smith were asked, since the commission's force is necessarily a small one, if it would not be possible for the organizations of operators, mine workers, wholesalers and retailers to contribute, under proper safeguards, findings of fact which would supplement the work being done by the commission's specialists. Neither of the two commissioners was inclined to look with favor on the suggestion. It is feared that public confidence in the commission's conclusions would be weakened if any of its findings were based on data prepared by the operators, the mine workers or other branches of the industry, regardless of the steps the commission might take to verify such data.

A flagrant outrage in the retailing of coal, Mr. Hammond said, appears to be taking place in the sale of coal by the bushel. The prices which the very poor are being compelled to pay for coal will be difficult to defend, Mr. Hammond thinks. The commission expects to look into that phase of the coal trade in the near future.

Bill Amending Coal Commission Act to Come Up in House Soon.

The bill to amend the act creating the U. S. Coal Commission so as to extend its powers, particularly in regard to obtaining sworn answers to questionnaires and providing penalties for failure to answer or for giving false answers, will be taken up in the House Friday, Feb. 9, or will go over until next week.

The bill was called up Monday by the Interstate Commerce Committee when it was reached on the unanimous consent calendar of the House. Representative Winslow, chairman of the committee, asked for its passage, but Representative Blanton, of Texas, objected. One objection was sufficient to prevent consideration Monday.

As the Interstate Commerce Committee has considerable legislation pending, the steering committee has set aside Friday for consideration of bills from this committee, with the possibility that the latter part of Thursday's session will see the start of this work. The committee has eight bills that its members consider important for early consideration and Chairman Winslow has set seven of them ahead of the coal commission amendment. If the commission bill is not reached Friday, a special rule to bring it before the House as an extraordinary item of business will be asked early next week, Chairman Winslow has announced.

Judge Alschuler Off Coal Commission

Judge Samuel Alschuler, of Chicago, has forwarded to President Harding his resignation as a member of the United States Coal Commission, and it will be accepted, it was announced at the White House Feb. 2.

Judge Alschuler's letter to the President tendering his resignation was not made public, but it was said at the White House that his action was prompted largely because, under the law, he could not serve on the commission and at the same time retain his position on the Circuit Court bench.

It was also said at the White House that the President will name a successor to Judge Alschuler, thus making the commission consist, as now, of seven members. No intimation was given as to whom the President has in mind to fill the vacancy nor when he would make a selection.

Pacific Coal Industry Not Overdeveloped

To the editor of *Coal Age*:

The statements of the U. S. Coal Commission, the American Mining Congress, *Coal Age* and, I might say, all technical papers as well as the newspapers that "there are one-third too many coal mines in operation" needs correction in so far as our county is concerned.

This statement could apply to the part of the United States east of the Mississippi River but not the part west of the river to the Pacific Coast. People in the West, and more particularly the Pacific Coast, who are trying to secure capital in the East to develop coal lands are confronted with this fact when they seek money in the East.

Montana, Wyoming, Colorado and New Mexico produce coal and are able to dispose of all they produce. Utah produces much coal but not enough to supply the demand on her. Arizona, Nevada and California produce no coal and have to depend on Colorado and Utah and coal by imports. Oregon produces about 1 per cent of the coal she uses and that is lignite produced at Coos Bay. Most of Oregon's coal comes from Utah. Idaho produces no coal. Lately they have been trying to open a coal vein in the Boise Basin, southern Idaho. She gets all her coal from Colorado, Utah, Wyoming, Montana, and British Columbia and Alberta, Canada. The State of Washington produces about 2,500,000 tons per year and consumes about 5,500,000 tons per year. Coal is shipped in from Colorado, Wyoming, Montana, Utah, Alberta, British Columbia and some comes in by boat from Japan, China, Australia, New Zealand and boats coming from Europe for lumber and grain bring in coal as ballast. The smelter at Tacoma gets all its coke by boat. California, Oregon and Idaho get coke from Utah and Crows Nest, B. C., and by boat. Ships plying from Atlantic ports through the Panama Canal to Pacific ports try to bring along enough coal to return on or to get back past the canal. Most all the ships sailing from Oregon and Washington go to Vancouver Island, B. C., for coal.

Records of steamships operating from coast to coast show that the best Atlantic Coast steamship coal is 25 per cent better than Utah or British Columbia coal and about 40 per cent better than the State of Washington coal (except the Roslyn, which is owned by the Northern Pacific Railway and consumed by that railway), which is not quite as good as the best coals of Utah or British Columbia.

In the West since the war, 1914, very few mines have been opened up and the old mines are getting more difficult and costly to operate.

Most of the coal land in Washington is within the Northern Pacific land grant and it is difficult to secure land enough for a coal mine without including Union Pacific Ry. lands and they try to dictate in leasing and want the freight haul.

At Vancouver Island, B. C., steamships pay $7.50 per ton for coal and for the same coal at Tacoma and Seattle, $11.60, and for Utah, $15.50. At Columbia River ports Utah coal for steamships is $13.75. In Japan and China they coal from $5 to $6; at California ports, Utah coal, $11.50 to $12.50. You can compare these prices on the cost of operating ships on the Pacific Coast against the coal prices on the Atlantic ports. The majority of the coal miners on the Pacific coast of British Columbia are Japs, Chinese and Hindus—in the United States, all whites.

Utah coal in Portland, Ore., retails for $17.25 per ton; lignite, about $10. Coals produced about Seattle and Tacoma retail from $8 to $13 per ton. All mining out this way is done in a small way compared with coal mining in Ohio, West Virginia, Virginia and Pennsylvania.

If some of the Eastern coal producers would come out to the Pacific Coast and mine coal the way they do in the East, they could make good profits by introducing extensive and cheap mining. All the Western coal producers have a hard time securing money. A friend of mine just returned from New York. He was trying to secure cash to build a couple of miles of railroad and reorganize a coal mine to extend production, but the impression that there were too many mines now in operation defeated his purpose and it is too much for the small operator or one operator to buck against public sentiment when the coal magazines and periodicals and government agencies are crying about that there are at least one-third too many coal mines opened up, which is not a fact in the Rocky Mountains and west to the Pacific Coast. *Coal Age* could do a great and good service by correcting this erroneous report and impression.

A professor who taught seventeen years in the Agricultural College in Iowa came to Washington and purchased a 960-acre fruit ranch which was paying well. In four years he assigned to his creditors. He then published a statement that it was one thing to teach farming and another thing to farm—"That no person should teach farming unless he had ten years' experience in farming first," and I think the same thing about the coal.

Trade Commission's Amended Answer in Maynard Case Stricken Out

The Supreme Court of the District of Columbia on Jan. 30, 1923, sustained the motion of the Maynard Coal Co. to strike out the "amended answer [of the Federal Trade Commission] upon the ground that it raises no defense." The Maynard case is the suit of the National Coal Association to restrain the Federal Trade Commission from collecting cost reports from coal operations. The case so far, including this decision, has gone clearly in favor of coal operators.

Justice Jennings Bailey said in part as follows:

"I think that the motion should be sustained. In my opinion no different question is raised from that decided in the case of the Claire Furnace Co. vs. the Federal Trade Commission, recently decided by the Court of Appeals.

"The defendant [the Federal Trade Commission] attempts to distinguish this case, and refers to the allegations of the amended answer to the effect that coal is impressed with a public interest, but the mere fact, if it be true, that coal is impressed with a public interest does not transfer the jurisdiction of its control from the states to Congress. The question is not whether a state may regulate the price and production of coal upon the theory that it is impressed with a public interest but whether such power has been given to Congress, and I find no such power.

"The defendant seems to confuse articles shipped in commerce with instrumentalities of commerce. The power to regulate the latter does not include the power to regulate the former. Nor does the fact that an article is necessary for the operation of an instrumentality of interstate commerce make it subject to regulation by Congress. If this were true, Congress would have the power to regulate the production of steel, necessary for the construction of locomotives; lumber, for the construction of coaches; rubber, for the construction of springs; food and clothing for the sustenance of the train crews; in fact, there is almost no article that might not be included in this manner. This question was fully covered by the recent decision of the Supreme Court in Heisler vs. Thomas Colliery Co. (No. 541—Nov. 27, 1922). In that case the State of Pennsylvania imposed a tax upon anthracite coal. The plaintiff sought to have the act adjudged unconstitutional. It was contended in that case that the tax was a regulation of interstate commerce."

Working a Year Non-Union, Mine Signs Up

An agreement has been entered into between the Fairmont & Lowesville Coal Co. and the United Mine Workers of subdistrict 4 of district 17, the coal company having signed the supplemental agreement late in January. For more than a year the company had been operating on a non-union basis and during that period action had been taken by the company to obtain possession of the dwellings of those who declined to work. About seventy-five miners are employed at the Fairmont & Lowesville company's mine and in recent weeks the officials of the union carried on such a vigorous organization campaign among them that the miners finally went on strike. There are several companies on the Monongahela Railway still operating on a non-union basis, however, among them being the River Seam Coal Co., the Sturm Coal Co. and the Delmar Coal Co.

Daugherty Questions Good Faith in Sale Of Lehigh & Wilkes-Barre Coal Co.

Attorney General Daugherty filed in the U. S. District Court in Philadelphia Jan. 30 a petition raising the question whether the proposed sale of the stock of the Lehigh & Wilkes-Barre Coal Co. to the Jackson E. Reynolds Syndicate of New York was made in good faith.

The stock of the coal company, which is owned by the Central Railroad of New Jersey was ordered sold under the U. S. Supreme Court decree for the dissolution of the Reading company's interests. The Jersey Central is controlled by the Reading company. The petition asks that any and all evidence bearing on the proposed sale be heard in court.

When the federal court was asked to confirm the sale to the Reynolds syndicate objections were raised by various parties on the ground that a bid by the Franklin Securities Corporation of Philadelphia was a better one. All objections were withdrawn, with the exception of that entered by Isaac T. and Mary T. W. Starr, minority stockholders in the Jersey Central.

One of the principal objections of the Starrs has been that Jackson E. Reynolds, head of the syndicate, who was officially connected with the Jersey Central and the Lehigh & Wilkes-Barre Coal Co., received "inside information," and that many members of his syndicate were disqualified from purchasing the coal stock. Hearings on the Starr objections were postponed several times.

Central Pennsylvania Renews Wage Scale

Operators and miners in the central Pennsylvania bituminous coal field came to an agreement on wages and working conditions at a conference between members of the Central Pennsylvania Bituminous Operators' Association and the officials of District No. 2, U.M.W. of A., held in Altoona on Wednesday and Thursday, Jan. 30 and 31. The agreement is identical with that under which the miners are working now and under which they went to work at the end of the strike in August, 1922.

The text of the brief agreement dated Altoona, Jan. 31, is as follows: "It is hereby agreed by the joint conference of the Association of Bituminous Coal Operators of Central Pennsylvania and the United Mine Workers of America of District No. 2 that the working agreement terminating on March 31, 1923, is hereby renewed and extended for one year from April 1, 1923, to March 31, 1924, in all the terms, provisions, customs and conditions."

The agreement was signed for the operators by B. M. Clark, president of the association; G. Webb Shillingford, vice-president, and Charles O'Neill, secretary-treasurer, in addition to twelve other operators, including John C. Forsythe, Rembrandt Peale, J. William Wetter, J. R. Caseley, C. B. Maxwell, E. W. Robertson, J. S. Sommerville, William Lamont, I. A. Boucher, Harry Boulton and M. J. Bracken.

The miners were headed by John Brophy, president of District No. 2, who signed the agreement, along with James Mark, vice-president, and Richard Gilbert, secretary, in addition to nineteen workers of the district attending the convention.

The scale provides as follows:

Pick mining, per gross ton, $1.28.

Pick mining, per net ton, $1.14.

Machine loading, per gross ton, $0.865.

Machine loading, per net ton, $0.772.

The inside day wage scale is:

Motormen, $7.60; spraggers, $7.50; skilled wiremen in charge of work being done, $7.50; wiremen's helpers, $7.27; track layers, $7.50; track layers' helpers, $7.27; bottom cagers, $7.50; drivers, $7.50; trip riders, $7.50; water and machine haulers, $7.50; timbermen, $7.50; pipe men, $7.42; trappers, $4.68; cutters, $7.60; scrappers, $7.35; all other inside day labor, $7.27.

The outside day wage scale is:

Dumpers, $6.92; ram operators, $7.10; pushers, $6.68; trimmers, $6.86; car cleaners, $6.60; firemen now working on change shifts of eight hours each, $7.10.

The day wage scales, both inside and outside, are identical with those operative when the men went to work August 16, 1920. The mining and loading prices are the same as those set April 1, 1920.

Three Sign Wage Agreements at Pittsburgh

Three wage-scale agreements were signed in western Pennsylvania last week continuing the present agreement for another year to March 31, 1924, in line with the tri-state agreement signed in New York Jan. 23.

The agreements signed last week, all with District No. 5, United Mine Workers of America, were signed in Pittsburgh, Pa., by the Pittsburgh Coal Producers' Association, the Thick Vein Freeport Coal Producers' Association and the Pittsburgh Coal Co., the last-named having withdrawn from the Pittsburgh Coal Producers' Association when that association signed the present agreement last summer.

Coal Companies Ask I. C. C. to Deny Reopening of Car-Rating Cases

The Interstate Commerce Commission has been petitioned not to grant the request of the carriers to reopen certain cases dealing with the rating of coal mines and the distribution of coal cars. The petition comes from the Slab Fork Coal Co., Scotia Coal & Coke Co., South Side Co., Turkey Knob Coal Co., Coal Run Coal Co., Branch Coal Co., Beachwood Coal & Coke Co., Greenwood Coal Co., Laurel Creek Coal Co., Quinnimont Coal Co., Maryland Coal & Coke Co., Star Coal & Coke Co., Ephraim Creek Coal & Coke Co. and the Stover Coal Co.

In addition to specific objections to the contentions of the carriers, the coal companies point out that the commission on its own motion has entered upon a general investigation of the reasonableness and propriety of all rules and regulations governing the rating of coal mines and the distribution of coal cars, including the 100-per cent rule which is at issue in the case which the carriers seek to reopen. For that reason the coal companies feel that questions involving the 100-per cent rule should be settled in the general opinion which will be issued in the assigned car case.

West Virginia Legislators Would Tax Coal

A number of bills have been introduced in both houses of the West Virginia Legislature **proposing a production tax on coal**, the rate proposed ranging all the way from 2c. to 10c. a ton. A bill introduced by Senator Suddarth, of Taylor County, fixes 2c. a ton as the rate to be paid. The Zimmerman bill, originating in the House, proposes a tax of 1 per cent of the value of all coal produced in the state, differing from other proposed production, privilege, license or depletion tax measures in that the tax is based on value rather than tonnage and being in that respect a sales tax. In the existing gross sales tax law the rate paid by coal is 0.4 per cent. In the bill introduced by Senator Hugus, of Ohio County, the rate proposed is 4c. a ton, at the mouth of the mine.

None of the measures proposed will be acted upon during the present or preliminary session but at the second or adjourned session beginning about the middle of March the principal tax issue will be between the advocates of a production tax and the advocates of a sales tax, coal operators generally favoring the latter, asserting that is more equitable to pay on value rather than to pay a flat rate on production without regard to the quality and market value of the coal produced.

600 Entombed in Silesian Mine Explosion

An explosion of fire damp in the Heinitz mine, at Beuthen, Polish Silesia, Jan. 31, entombed 600 miners, according to a press dispatch.

Of the 800 men composing the morning shift, who went into the mine shortly before the explosion, 300 still had not been rescued up to a late hour Feb. 1. Sixty bodies had been removed at latest advices and many of the rescued were suffering from injuries and were taken to hospitals.

To Penalize Anthracite Operators Failing To Report 1922 Output for Taxation

Anthracite companies and producers that failed to file reports of their 1922 production for taxation purposes by Feb. 1, unless they obtain extensions of time for filing, will be penalized, according to an announcement by Auditor General Samuel S. Lewis, of Pennsylvania. The Auditor General said that he purposes collecting the penalty even from companies whose tax cases for 1921 are still in litigation. Numerous companies, he said, have not filed reports nor asked for an extension of time.

The reports are desired, the state's fiscal officer said, in order to compute the tax due the commonwealth and also for an investigation the department is making relative to prices at the mines. In all cases where producers fail to file their reports promptly, the Attorney General's department will be notified.

A statement issued last week by the Auditor General's department shows that $2,000,000 has either been collected or is in process of collection from the anthracite producers of Pennsylvania, who owe taxes on coal mined during the last half of 1921. The statement follows:

"There have been recorded to date payments aggregating $1,807,588.15 for anthracite tax for the period from July 1 to Dec. 31, 1921, most of these payments having been made within a little more than a month. There is also in the process of payment sufficient to bring the total to approximately $2,000,000. . . .

"The total of the accounts settled for the period mentioned is $3,271,534.82, including some estimated settlements subject to revision upon the determination of pending litigation and not including interest charges. Payment of unpaid accounts is largely held up by litigation. . . .

"For the period named, accounts were made against 225 operators, representing 324 collieries or operations. No tax was assessed against 58 operators having unproductive collieries or operations during the period. Payments have been made to date by 109 operators, leaving 58 unpaid accounts."

Coal-Grading Bill Up in Pennsylvania Senate Penalizes Misrepresentation

A coal-grading bill was introduced in the State Senate at Harrisburg, Pa., Jan. 30 by Senator Horace W. Schantz, Lehigh County. It was referred to the Committee on Mines and Mining. The measure makes it unlawful to misrepresent the grade of coal sold or offered or advertised for sale. The bill covers anthracite, bituminous, semi-bituminous and all other grades of coal.

According to the provisions of the bill all coal sold within Pennsylvania is graded as follows:

Grade A—All coal containing less than 10 per cent of ash and less than 1½ per cent of sulphur.

Grade B—All coal containing less than 15 per cent of ash and less than 3 per cent of sulphur.

Grade C—All coal containing less than 20 per cent of ash and less than 4½ per cent of sulphur.

Grade D—All coal not classed as A, B or C.

The bill provides that all samples to determine the ash and sulphur contents shall be taken from the coal as it is sold or offered for sale on the market and not from samples taken in the mines. All samples analyzed shall be taken from a fair proportion of the whole quantity of the coal in question.

Under the provisions of the measure any person, association, copartnership or corporation selling or offering for sale or advertising for sale any coal, representing it to be of the first three grades, when the coal is below those standards, is guilty of a misdemeanor and upon conviction shall be sentenced to a fine of $1,000. The proposed act does not prohibit the sale of coal on specifications as to ash and sulphur content other than those designated by the provisions of the bill.

Senator Walsh, of Massachusetts, has presented to the U. S. Senate a letter from the State Fuel Administrator of Wisconsin, alleging impurities in coal shipments. Senator Walsh said inferior coal was being sold at high prices and that some method of standardization must be adopted to protect the public against deceit and fraud. The Wisconsin Administrator charged that anthracite coal now shipped carries greater percentages of impurities than ever before, and that the states are powerless to act.

The Massachusetts Senator has introduced a bill to establish standards for anthracite shipped in interstate or foreign commerce. The measure authorizes the Secretary of Commerce to establish by regulation standards of size, quality and condition of anthracite to be known as the U. S. Official anthracite coal standard. The bill forbids the shipment or delivery for shipment in interstate or foreign commerce of anthracite which is not of a grade fixed by these standards, and anthracite of a grade fixed by these standards under the name, description or designation of any other standard. The bill would permit the shipment or delivery for shipment to any foreign country of a grade not fixed by standard according to the specification or directions of a foreign purchaser, if the shipment is not in conflict with laws of such foreign country. Violation of the law would subject the offender to a fine of not more than $1,000 or imprisonment for not more than one year, or both. The bill was referred to the Committee on Labor, which reported favorably on it Feb. 5.

Hearing of Motion to Dismiss Petition for Logan Injunction Set for Feb. 12

Argument on the motion of counsel for the Logan Coal Operators Association to dismiss a bill of complaint filed by District 17, United Mine Workers, in the U. S. District Court for the southern district of West Virginia on Feb. 1 to restrain interference with any effort which might be made by the union to organize the Logan field, has been set for Feb. 12 by Judge George W. McClintic. In its application for an injunction the district union seeks also to restrain the Sheriff of Logan County from accepting money from the coal operators of the district for the pay of deputy sheriffs.

The argument of attorneys for the operators is that the case does not come within the jurisdiction of the federal court "since the violation of no federal law or interstate commerce regulations are charged," and it is also contended by them that all the matters charged are "solely within the jurisdiction of the state courts."

In applying for an injunction in the federal court the union seeks to prevent Sheriff Don Chafin of Logan County from interfering with the members or organizers of the union in the Logan County field, or in other words to give them free reign.

This is the first time the union has resorted to the injunction process since the decision of the U. S. Supreme Court in the Coronado case and operators in southern West Virginia look upon the petition for an injunction as the beginning of another general attempt to unionize the large territory south of the Kanawha River in West Virginia all of which is now on a non-union basis.

Pennsylvania Coal and Iron Police to Be Assigned Only in Real Emergency

Governor Gifford Pinchot, of Pennsylvania, has made an announcement to the effect that the coal and iron police, heretofore commissioned by the Governor without much formality, will in the future only be assigned where a real emergency exists and then only after investigation, if necessary.

A bill presented in the Pennsylvania Senate by John E. Stavitski, of Luzerne County, prohibits sheriffs, unless called upon by the local police authorities, to interfere in times of riot or disturbances. The bill provides that in all cities, boroughs or townships wherein there is an organized police force, it shall be unlawful for the sheriff of the county to enter therein, either in person or by deputy, for the purpose of suppressing riots or disturbances, unless he has first been requested by the officer or officers having control and authority over the police force of such municipalities.

Soft-Coal Stocks on Jan. 1 Total 36,000,000 Tons, Sufficient for 26 Days, Survey Report Shows

Industries other than steel and coke had on hand Jan. 1 an average of 40 days' supply of bituminous coal, retail coal dealers' bituminous supply amounted to 18 days, electric utilities had 33 days' supply and coal-gas plants had 60 days' supply, according to the latest survey of coal stocks by the U. S. Geological Survey.

At the rate coal was burned in November and December of last year, the report said, the stocks of soft coal on hand Jan. 1, 1923, would last 26 days and there are indications that stocks have increased since that date.

On Oct. 1, 1922, stocks on hand were sufficient to last 21 days and on June 1, 1920, when stocks were at the lowest point on record, they were sufficient for only 15 days.

The Survey shows that on Jan. 1, 1923, there were approximately 36,000,000 net tons of soft coal on hand, an increase of 4,000,000 net tons over Nov. 1, 1922, and 6,000,000 net tons over Oct. 1, 1922.

Stocks of bituminous coal in retail yards on Jan. 1, 1923, were approximately three-quarters what they were on the corresponding date a year ago. Stocks of anthracite were not quite 30 per cent of those of the same time a year ago. The total stocks of retail dealers—including both hard and soft coal—showed a decrease of 52 per cent when compared with those of Jan. 1, 1922.

Reports from 583 representative coal yards show an average of 10 days' supply of anthracite on hand. The 124 yards examined in the New England states had an average supply of 13 days each. When compared with reports received from 516 yards on Nov. 1, 1922, the survey indicates an increase of 1 per cent over that date; 70 per cent less than on Jan. 1, 1922; 41 per cent less than on Jan. 1, 1921, and 54 per cent less than on Jan. 1, 1919.

The report shows that many of the Western States had large stocks and that the decrease was most marked in the

DAYS' SUPPLY OF SOFT COAL IN HANDS OF REPRESENTATIVE INDUSTRIAL CONSUMERS, PUBLIC UTILITIES AND RETAIL COAL DEALERS, JAN. 1, 1923.

(Figures represent number of days stocks would last at current rate of consumption)*a*

Union Completes Official Count of Votes In International Election

John L. Lewis received 193,824 votes for president of the United Mine Workers of America in the election held Dec. 12, according to the official count, completed Feb. 2. Philip Murray, of Pennsylvania, received 187,659 for vice-president, and William Green, of Ohio, 189,697 for secretary-treasurer. All three international officers were re-elected without opposition.

Besides these three, the following were chosen to represent the miners in the convention of the American Federation of Labor: Frank Farrington, Illinois; Thomas Kennedy, Pennsylvania; Fred Mooney, West Virginia, and John Moore, and Lee Hall, Ohio.

Northwestern Dock Operators' Association Engages Wayne Ellis as Secretary

Wayne Ellis has been selected for the secretaryship of the Northwestern Dock Operators' Association. He was selected for this important position because the dock operators are convinced that he has as thorough knowledge of coal distribution as is possessed by any coal specialist in the country. The appointment became effective Feb. 5, but Mr. Ellis was not able to undertake his duties on that date, due to the necessity of concluding some of the work he has under way for the President's Coal Commission.

THE ANACONDA COPPER MINING CO. contends that the tentative report of the Interstate Commerce Commission's examiner in the Western Coal Rate case is in error in failing to recommend that these rates be reduced.

Refuse Anthracite Data to District of Columbia Utilities Commission

Efforts of the Public Utilities Commission of Washington, D. C., to find out how much hard coal dealers in the capital are receiving from the Philadelphia & Reading Coal & Iron Co. and how those receipts compare with last winter's shipments have been without result so far. The commission sought this information after some local coal merchants had complained that they were not getting their proper proportion of the anthracite shipped by the P. & R.

The commission states that it asked that company for the desired information to verify the complaints, but that "this request was not complied with either by the main office of the company or by its local representative, and the commission, accordingly, asked the assistance of the Federal Fuel Distributor in securing the desired information."

The reply received by Engineer Commissioner Keller from Federal Fuel Distributor F. R. Wadleigh quoted a letter from Mr. Parker, director of anthracite distribution, as follows:

" 'The information requested by Colonel Keller, District Commissioner, is of strictly confidential character, which the anthracite companies have always definitely declined to furnish to anyone, and while I should like to be of service to Colonel Keller or to any other official who is assisting in the solution of the problems we have facing us, I regret that I cannot convey his request to the Philadelphia & Reading Coal & Iron Co. for a statement as to the shipments made to various dealers in the District of Columbia during the coal years of 1921-22 and 1922-23.

" 'If there is any part of the city or the District that has failed to get its proper proportion of the tonnage available through the failure of any particular dealers or dealers to get his or their supply, and I am advised to that effect, I will be glad to put the matter up to the Philadelphia & Reading Coal & Iron Co. or other shippers, but that is as far as I feel I can go in the matter.' "

Ogle Commends Commission Study of Relative Labor Efficiency and Storage

Alfred M. Ogle, president of the National Coal Association, expressed great satisfaction on learning that the President's Coal Commission will make it a special point to ascertain the relative efficiency of union and non-union labor. This and the study the commission is making of storage offer particular possibilities for being constructive and helpful to the industry, he said. He believes, as the investigation of the storage situation progresses, the commission will find that storage at the mine mouth is impracticable, except at very small mines. The principal disadvantage of storing at the mine mouth lies in the inability of the railroads to furnish sufficient transportation to move such coal in storage during times when the consuming public requires it.

"It seems an unnecessary expenditure of money," Mr. Ogle says, "to buy more coal cars under conditions as they exist today on the railroads. The trouble at the present time is with motive power and inadequate yard and terminal facilities. There are certain bottle necks on some of the most important coal roads which limit and disrupt the distribution of coal."

Mr. Ogle called attention to the fact that many of the statements made by the Coal Commission in its Jan. 15 report are being misinterpreted in the daily press. For instance, it is being published widely that the commission has found profiteering to be one of the causes of high coal prices, when as a matter of fact the commission's report states that "it has been suggested to us that one of the causes of high prices of coal is profiteering." In the next paragraph the commission goes on to point out that it has not yet obtained the figures to settle the question.

He fails to see where overdevelopment can be attributed as a cause for high prices. Excessive production is commonly supposed to be a factor in depressing prices. In Mr. Ogle's opinion, there would be no difficulty at any time, despite transportation drawbacks, in furnishing the country

its full requirements of coal, were it not for the interruptions in production and distribution by recurring strikes.

With all their other difficulties, Mr. Ogle feels that the operators should be spared the burdens heaped on them by unfair attacks from such responsible agencies as the Associated Press and the U. S. Department of Labor. On the eve of the wage agreement in New York, he states, the Associated Press carried an article which was an undeserved reflection on the operators. He feels that one of the recent radio releases of the Department of Labor is a most unjustifiable and indefensible attack on the entire coal industry. In addition, he believes that release can be regarded only as a serious discourtesy to the President's Coal Commission.

May Be Necessary to Extend Life of Coal Commission to Dec. 31, Says Hammond

As there has been delay in obtaining the legislation to compel swearing to answers to questionnaires, it may be necessary to extend the life of the President's Coal Commission until Dec. 31, Chairman Hammond intimates in a letter written to the Director of the Budget. The full text of the letter follows:

"The appropriation for the U. S. Coal Commission is in the following language:

To carry out the provisions of the act entitled "An act to establish a commission to be known as the U. S. Coal Commission for the purpose of securing information in connection with questions relative to interstate commerce in coal, and for other purposes," including personal services in the District of Columbia and elsewhere, and rent if space can not be assigned by the Public Buildings Commission in other buildings under the control of that commission, fiscal year 1923, $200,000: *Provided*, That no part of this sum shall be available for the payment of compensation of any person in excess of $7,500 per annum.

"To continue this work after June 30 and on the scale required by the terms of the act of Sept. 22 necessitates the submission of the following supplemental estimate:

To continue and conclude the investigation under the act entitled "An act to establish a commission to be known as the U. S. Coal Commission for the purpose of securing information in connection with questions relative to interstate commerce in coal, and for other purposes," including personal services in the District of Columbia and elsewhere, $400,000, to continue available for expenditure until Sept. 22, 1923, or until Dec. 31, 1923, provided the President, if he deems the continuance of the work of the commission essential to the public interest, may, by Executive order, continue the commission in force to a date not later than Dec. 31, 1923.

"The expenditures to date with all liabilities and salary encumbrances to June 30 do not exceed the amount appropriated, so that no deficit has been incurred nor need be anticipated if Congress desires only incomplete consideration of the subjects submitted to the commission for investigation.

"It is, however, quite manifest that the commission will not have discharged its duty to the Congress and the people of the United States by a report to the Congress touching certain phases of the industry and not covering the industry as a whole. To be of any use whatever, it must submit what it believes to be the truth about production, distribution, and consumption of coal, embracing, as these questions of cost and price necessarily do, the overhead charges, the income upon the investment, whether properly or improperly computed, the earnings of miners, not by averages but by classes, the problem of overdevelopment of mines and overmanning of the industry, the contracts which are entered into for the sale of the coal, the activities of wholesalers and jobbers, the transportation question in all of its ramifications, the retailing of the coal and the profits derived by the retailer and whether such profits are computed upon improper bases or not.

"There are approximately 9,000 mines involved in the inquiry. To avoid extravagant expenditure of the public funds by the indiscriminate subpoenaing of witnesses from these mines to appear before the commission, it has adopted the policy of having prepared by skilled persons certain questionnaires to be sent out in the first instance. When these have been returned, the commission will be enabled to determine upon what points it should take oral testimony to satisfy itself not only that the figures are correct but also that they are made upon bases fair and just to the American people. It is also quite evident that the controversy arising from what is known as the civil rights of American citizens into a controversy between the non-union mines and those which are operated by the United Mine Workers of America involves a painstaking hearing on the alleged facts presented by each side of the controversy.

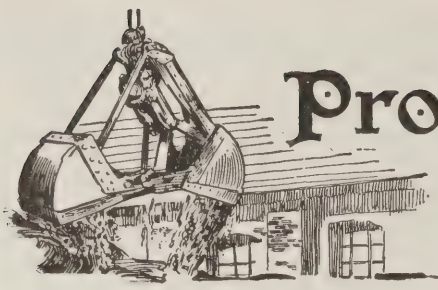
"The Congress of the United States has also asked a report as to the conditions of life in the coal-mining communities of this country. This necessitates the sending of skilled social students into the various mining districts of America in order that they may present to the commission a view of the conditions of life in the various mining districts of our country. In the usual and ordinary way for obtaining facts, millions of dollars might be spent in the way of taking a transcribed testimony, and volume after volume might be filled with this testimony, but when so obtained it would require a technical student to pick out and separate the important facts from the mass of irrelevant matter. This commission has adopted the other plan, the one briefly described above, of endeavoring to obtain all undisputed facts through the medium of questionnaires and undisputed public documents.

"It is evident that with an additional appropriation of $400,000 it can complete the survey by its trained workers, can eliminate from taking of testimony all undisputed facts, and can compress within reasonable bounds the testimony necessary to reach measurably accurate conclusions upon the facts in controversy.

"This commission is not inclined to sit for the purpose of sitting. It does not care to waste time. It seeks to make the record of a commission which recognizes its duty to end its work as speedily as possible.

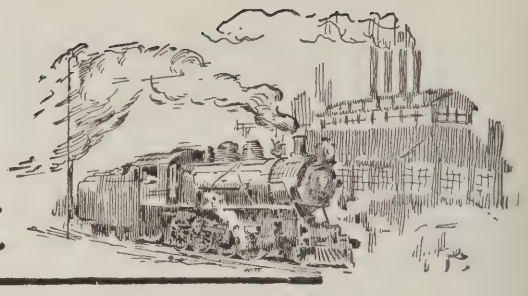
"However, the commission has not yet the power to compel swearing to answers to questionnaires for which it asked Congress. Notwithstanding delays beyond its control, the commission's purpose and hope are to conclude its labors by the 22d day of September, the time fixed in the original act. It, therefore, requests that the President of the United States may be empowered, if he deems it essential to the public interest, to continue the work of the commission to Dec. 31, 1923, and in that event the appropriation here sought shall continue to be available until that time."

"Danger of Coal Panic Past," Says Hoover



Under the caption, "Danger of Coal Panic Past," the leading editorial in the Feb. 5 issue of United States Weekly Commerce Reports, published by the Department of Commerce, which is reported to have been written by Secretary Hoover himself, descants on the bituminous coal situation as follows:

"The United States appears to have effectually passed the point where there is any danger of a coal panic as the result of short coal deliveries. The stoppage in coal production for nearly five and one-half months during the summer of 1922 threw a great burden upon the government in securing such distribution of coal as would maintain the industries and commerce of the country intact.



"Although approximately 60 per cent of the country's bituminous mines were closed during the period of the strike, the campaign carried on by the Department of Commerce prior to the coal strike in securing the upbuilding of national stocks to the unprecedented sum of nearly 85,000 000 tons, together with the measures taken for control of distribution subsequent to the strike, have enabled us to weather the difficulties successfully.

"The price of spot bituminous coal at the mines has averaged $4.16 per ton since the beginning of the strike on April 1, 1922. This compares favorably with an average of $5.64 per ton for spot coal for the year 1920, when there was no stoppage of production and when the output was less than 2 per cent below the maximum of any previous year. During the year 1922 we have had to face both a shortage of transportation and a tremendous stoppage of production, yet there has been less crippling of industry, with respect to both coal distribution and price, than on the previous occasion.

"The signing of the new wage agreement and its effect on labor afford a safeguard against any further stoppage in production for another year, and the stability that will thus be created will contribute materially to a renewal of competitive conditions."

Production and the Market

Weekly Review

The sharp drop in prices of soft coal, in view of the continued steady output of 11,000,000 tons per week, is the best indication of what is happening to the spot market. The buyer is gradually getting the better of it. *Coal Age* Index of spot prices of bituminous coal dropped 30 points in a week, from 342 on Jan. 29 to 312 on Feb. 5, corresponding to an average price on Feb. 5 of $3.78.

The most pronounced declines were in eastern Kentucky, Kanawha and Clearfield, where the drop was around 50c., and Cambria and Somerset and Smokeless, the low volatiles, of from 60c. to 80c. Buyers are clinging to the spot market and display no anxiety whatsoever.
